words, and insignia peculiar to itself. It originated in Utica, N. Y., where it was organized by Daniel Cady and others, in 1851, and extended to England in 1868. There is no restriction placed on membership on account of color, age, or sex. The organization consists of local "subordinate" lodges, county "district" lodges, national "grand" lodges, and an international "right worthy" grand lodge. A "juvenile order" is also attached, and the Templars have founded an orphanage at Sunbury, near London, at a cost of $50,000. It has no beneficiary system. Its platform consists of total abstinence from all intoxicating liquors as a beverage, no license, but prohibition of manufacture and sale, and the election of men who will enforce the liquor laws. The motto of the order is "Faith, Hope, and Charity." It is an outgrowth of the Sons of Temperance.

Good-will, the benefit derived from a business beyond the mere value of the capital, stock, funds, or property employed in it, in consequence of the general public patronage and encouragement which it receives from constant and habitual customers. It is legally considered a subject of sale along with the stock, premises, fixtures, trade debts, etc. It is usual for the seller to enter into an express covenant not to carry on a business of the same kind at some specified moderate distance from the place where the purchaser resides, and if he breaks the covenant he is liable to an action for damages. In most of the States of the Union the purchaser of good-will can only cut the seller off from soliciting old customers of the business surrendered and from otherwise attempting to supplant the new tenant in popular favor, by securing a written contract.

Good'ale, Dora Read, American poet: b. Mount Washington, Berkshire County, Mass., 29 Oct. 1866. With her older sister, Elaine Goodale (q.v.), she began to write verse in early childhood. Her poems, and those of her sister, appeared in magazines at that time and attracted much favorable notice. With her sister she published: 'Apple Blossoms' (1878); 'In Berkshire with the Wild Flowers' (1879); 'All Round the Year' (1880). She has also published 'Heralds of Easter' (1887).

Goodale, Elaine (Mrs. Eastman), American poet: b. Mount Washington, Mass., 9 Oct. 1863. In June 1891, she was married to Charles A. Eastman, M.D., an educated Sioux Indian. At an early age she began to write verse and with her sister Dora (q.v.) published: 'Apple Blossoms: Verses of Two Children' (1878); 'In Berkshire with the Wild Flowers' (1879); 'Verses From Sky Farm' (1880). She was sole author of 'Journal of a Farmer's Daughter' (1881). She taught for some time in the Hampton Institute in Virginia, and edited the 'Southern Workman' (1883). In 1885 she visited the Great Sioux reservation, and subsequently taught school at White River Camp, Lower Brulé Agency, Dakota.

Goodale, George Lincoln, American botanist: b. Saco, Me., 3 Aug. 1839. He was graduated from Amherst College in 1860 and has been instructor and professor of botany at Harvard from 1872. He has published: 'Concerning a Few Common Plants' (1879); 'Physiological Botany' (1885); 'Wild Flowers of America' (1886); 'Useful Plants of the Future.'

Good'all, Edward, English line-engraver: b. Leeds 17 Sept. 1795; d. London 11 April 1870. He was self-taught, and early in his career attracted the notice of Turner, a number of whose pictures he engraved. He also engraved many plates for the annuals.

Goodall, Frederick, English painter: son of Edward Goodall (q.v.): b. London 17 Sept. 1822; d. London 29 July 1904. At 17 years of age he began to exhibit, and he has produced some pictures of high excellence. He was elected to the Royal Academy in 1863. Among important works of his are: 'Raising the Maypole in the Olden Time' (1851); 'Cranmer at the Traitors' Gate' (1856); 'The Subsiding of the Nile' (1873); 'Andromeda' (1887); 'The Thames from Windsor Castle' (1890); 'Isles of Loch Lomond' (1891); 'The Palm Grove' (1894).

Goode, George Brown, American naturalist: b. New Albany, Ind., 13 Feb. 1851; d. Washington, D. C., 6 Sept. 1896. He was graduated from Wesleyan University in 1870, and from 1887 was assistant secretary of the Smithsonian Institution. Among his publications are: 'Museums of the Future' (1890); 'American Fishes'; 'Nature and Economic History of the American Menhaden.'

Goode, Richard Urquhart, American geographer: b. Bedford, Va., 8 Dec. 1858. He studied at the University of Virginia, was topographer to the United States Geological Survey in 1879–82, engineer and topographer of the Northern Transcontinental Survey in 1882–4, and in 1889 was appointed geographer of the United States Geological Survey. His writings include reports and articles in periodicals.

Goode, William Athelstane Murray, American newspaper correspondent: b. Newfoundland 10 June 1875. After service in the British merchant marine and the United States cavalry, he became assistant night city editor of the New York *Recorder,* later city editor of the *Mercury,* and finally correspondent of the Associated Press, of which he was representative on board the flagship New York during the Spanish-American war. He contributed to magazines and published 'With Sampson Through the War' (1899).

Goodell', Henry Hill, American educator: b. Constantinople, Turkey, 20 May 1839; d. at sea 23 April 1905. He was graduated from Amherst College in 1862; was in the Union army in 1862–3; professor in the Massachusetts Agricultural State College in 1867–86, and in 1886 became its president. For several years he was chairman of the Executive Committee of the Association of American Agricultural Colleges and experiment stations, and in that capacity did much to further the interests of agricultural education.

Goodell, William, American missionary: b. Templeton, Mass., 14 Feb. 1792; d. Philadelphia 18 Feb. 1867. He was graduated from Dartmouth College in 1817, and from the Andover Theological Seminary in 1820; was ordained to the Congregational ministry in 1822, and in the same year went to Syria as a mis-

sionary. In 1823 he assisted in the establishment of the mission-station at Beirut, in 1823–8 was active there, in 1828–31 at Malta, in 1831–65 at Constantinople. Among his most important works was the preparation of a translation of the Bible into Armeno-Turkish.

Goodell, William, American abolitionist: b. Coventry, N. Y., 1792; d. 1878. He was in business at different times in Providence, Alexandria, Va., and New York; in 1827 began at Providence the publication of the *Investigator*, and later was editor of a series of abolition periodicals, including the 'Friend of Man,' official mouthpiece of the New York Anti-slavery Society; the 'Radical Abolitionist,' and the 'Principia.' His published volumes include: 'The Democracy of Christianity' (1851); 'Slavery and Anti-slavery' (1852); 'The American Slave Code' (1853).

Goodknight, James Lincoln, American educator: b. Allen County, Ky., 24 Aug. 1846. He was graduated from Cumberland University (Lebanon, Tenn.) in 1871, from the Union Theological Seminary in 1879, studied also at Edinburgh and Jena, and was president of West Virginia University (Morgantown). In 1900 he became president of Lincoln (Ill.) University. His articles have appeared in various periodicals.

Good'land, Kansas, county-seat of Sherman County; on the Chicago, R. I. & P. R.R. The manufactures are flour and machinery. The city contains railroad repair-shops and grain elevators, and is the centre of trade for a large agricultural region in which there are a number of cattle ranches. Pop. (1900) 1,059.

Good'man, Edward John, English journalist and novelist: b. London 19 Dec. 1836. He entered journalism in 1857 and has served on the editorial staffs of several prominent English journals, including the London *Daily Telegraph*. Besides 'The Best Tour in Norway' (1891); 'Wilson's Handbook to Norway' (1894); and 'New Ground in Norway' (1896), he is the author of the novels 'Too Curious' (1887); 'Paid in His Own Coin' (1888); 'His Other Self' (1889); 'The Only Witness' (1891); 'The Fate of Herbert Wayne' (1892); 'The Night of the Fog' (1895).

Good'now, Frank Johnson, American legal scholar: b. Brooklyn, N. Y., 18 Jan. 1859. He was graduated from Amherst College in 1879, from the Columbia Law School in 1882, studied also at the Paris Ecole Libre des Sciences Politiques and Berlin University, and was appointed to the chair of administrative law at Columbia in 1883. A recognized authority on municipal, administrative, and constitutional law, he published: 'Municipal Home Rule' (1890); 'Comparative Administrative Law' (1893), 'Municipal Problems' (1897); 'Politics and Administration' (1900).

Good'rich, Alfred John, American writer on musical subjects: b. Chilo, Ohio, 1847. Largely self-taught, he was professor of musical theory in several institutions, and from 1899 directed his attention wholly to writing and private instruction. 'Music as a Language' (1880); 'Complete Musical Analysis' (1889); and 'Analytical Harmony' (1894) are among his books.

Goodrich, Charles Augustus, American Congregational clergyman: b. Ridgefield, Conn., 1790; d. Hartford, Conn., 4 Jan. 1862. He was graduated at Yale in 1812 and held pastorates of Congregational churches in Worcester, Mass., 1816–20, Berlin, Conn., 1820–48, and Hartford, Conn., from 1848. He published: 'Lives of the Singers' (1829); 'History of the United States' (1852–55); 'Universal Traveler,' etc. He was a brother of S. G. Goodrich (q.v.).

Goodrich, Chauncey Allen, American clergyman and lexicographer: b. New Haven, Conn., 23 Oct. 1790; d. there 25 Feb. 1860. He was graduated at Yale College in 1810, and was tutor there 1812–14. After a course of theological study he entered the ministry and was pastor of a Congregational church in Middletown, Conn., 1816–17; was elected professor of rhetoric and oratory in Yale 1817–39, and became professor of pastoral theology in the theological department of the college in 1839. While tutor he published in 1814 a Greek grammar, translated chiefly from the grammar of Hachenberg. This he subsequently revised and enlarged, and published under his own name. It was often reprinted, and for many years was extensively used. About 1832 he published 'Latin Lessons' and 'Greek Lessons,' in which the precepts of grammar are throughout accompanied by practical exercises — a method subsequently applied by Ollendorff to modern languages. In 1828 Noah Webster (his father-in-law) entrusted to him the superintendence of the octavo abridgment of his large dictionary, by J. E. Worcester, with discretionary power to conform the orthography more nearly to the common standard. After several years of labor, he published in 1847 greatly enlarged and improved editions of the 4to and 8vo dictionaries of Dr. Webster. In 1856 he published in 8vo the university edition of Webster's dictionary, and in 1859 a new issue of the unabridged 4to dictionary.

Goodrich, Frank Boot («Dick Tinto»), American writer: b. Boston, Mass., 14 Dec. 1826; d. Morristown, N. J., 1894. He first became known by his Paris letters to the New York *Times*. He was the author of: 'Court of Napoleon: or, Society Under the First Empire' (1857); 'Women of Beauty and Heroism' (1859); 'World-Famous Women, from Semiramis to Eugénie' (1870); etc.

Goodrich, Samuel Griswold («Peter Parley»), American writer: b. Ridgefield, Conn., 19 Aug. 1793; d. New York, 9 May 1860. He began as a publisher in Hartford, and established himself in 1824 as a publisher in Boston. He edited there, from 1828 to 1842, 'The Token,' an annual to which he contributed several tales and poems, and in which also appeared some of Hawthorne's 'Twice-Told Tales.' His famous Peter Parley series of popular and juvenile books was begun soon after his removal to Boston, and gradually extended to more than 116 volumes, comprising geographies, histories, travels, stories, and various illustrations of the arts and sciences. The geniality of these, and the admirable manner in which the author enlisted the sympathies of children, procured for them an immense success, which led to the issue in England of some spurious books under the name of «Peter Parley.» In 1837 he published a collection entitled 'The Outcast, and

Other Poems'; and in 1838 an ethical and educational work entitled 'Fireside Education.' In 1841 appeared a selection from his various contributions to annuals and magazines under the name of 'Sketches from a Student's Window'; and in 1857 'Recollections of a Lifetime,' a most entertaining account of his own history and that of his contemporaries. 'Merry's Museum' and 'Parley's Magazine' were conducted by him from 1841 to 1854. Under Fillmore's presidency he acted as American consul at Paris, and published there in French a treatise on 'American Geography and History.' The last work from his pen was the 'Illustrated Natural History of the Animal Kingdom' (1859).

Good'sell, Daniel Ayres, American Methodist bishop: b. Newburg, N. Y., 5 Nov. 1840. Graduated from New York University (then the University of the City of New York) in 1859; he entered the Methodist ministry in the same year; in 1880–8 was literary editor of the 'Christian Advocate' of New York, and in 1888 was elected bishop and became secretary of the Methodist board of education. He wrote 'Nature and Character at Granite Bay' (1901).

Goodwin, J. Cheever, American dramatist: b. Boston 14 July 1850. He was graduated from Harvard in 1873, was a reporter on the Boston *Traveller* in 1873–4, and secretary to the comptroller of New York in 1886–91. His writings include verse in periodicals and many plays, among them some popular successes, such as 'Evangeline,' 'The Panjandrum,' 'Wang,' 'The Lion Tamer,' 'Lost, Strayed, or Stolen,' and 'The Monks of Malabar.'

Goodwin, Maud Wilder, American historical novelist: b. 1856. She has published: 'The Colonial Cavalier'; 'The Head of a Hundred'; 'White Aprons: An Historical Romance'; 'Dolly Madison,' a biography; 'Historic New York' (1898); 'Sir Christopher'; 'Flint'; etc.

Goodwin, Nathaniel Carl, American actor: b. Boston 1857. His first appearance was made in 'Law in New York,' at the Howard Athenæum, Boston, and subsequently he became known in burlesque and light comedy. Among the dramas which he has since presented are: 'A Gilded Fool'; 'In Mizzoura'; 'An American Citizen'; his chief success, 'Nathan Hale'; and 'The Altar of Friendship.' He also essayed «Shylock» in Shakespeare's 'Merchant of Venice.'

Goodwin, William Watson, American Greek scholar: b. Concord, Mass., 9 May 1831. He was graduated at Harvard College in 1851; and was Eliot professor of Greek there 1860–1901. He published: 'Syntax of the Moods and Tenses of the Greek Verb'; 'Greek Grammar'; and a revised translation of 'Plutarch's Morals' (1871).

Good'y, a local name in the Southern States for a small bay fish (*Leiostomus xanthurus*), much liked as a pan-fish, and known also as «lafayette» and about New York as «spot.» It is one of the family *Sciænidæ* (see DRUM-FISH), has a deep, compressed body, bluish above and silvery below, with «about 15 narrow, dark, wavy bands extending from the dorsal downward and forward to below lateral line; a round black humeral spot rather smaller than the eye.» It abounds from Cape Cod to Texas.

Good'year, Charles, American inventor: b. New Haven, Conn., 29 Dec. 1800; d. New York 1 July 1860. After coming of age, he joined his father in the hardware business at Philadelphia. Among the improved implements introduced by them was the steel pitchfork, a substitute for the heavy iron fork previously used. The firm being overwhelmed by the commercial disasters of 1830, Goodyear selected as a new occupation the improvement of the manufacture of India rubber. The first important improvement made by him was at New York in 1836, being a method of treating the surface of native India rubber by dipping it into a preparation of nitric acid. This discovery enabled the manufacturer to expose an India rubber surface in his goods, which on account of adhesiveness was before impracticable. The nitric acid gas process, as it was called, was introduced into public use, and met with great favor, especially in the manufacture of shoes, which continued to be made by that process in great numbers at Providence, R. I., until it was superseded by the invention of vulcanized rubber, for which he obtained a patent in 1844. From this period he employed himself in ascertaining new methods of employing rubber till the patents granted him were 60 in number. He received medals from the Exhibitions at London (1851) and Paris (1855), but his rights were continually infringed, and he remained poor while others were enriched by his inventions.

Goodyear, William Henry, American writer on art: b. New Haven, Conn., 21 April 1846. He was appointed curator of the New York Metropolitan Museum of Art in 1881. He has published: 'Ancient and Modern History' (1883); 'History of Art' (1887); 'The Grammar of the Lotus' (1890); 'Roman and Mediæval Art' (1893); 'Renaissance and Modern Art' (1894); etc.

Goo'kin, Daniel, American author and official: b. Kent, England, about 1612; d. Cambridge, Mass., 19 March 1687. He came with his father to Virginia in 1621, whence he removed in 1644 to Massachusetts, in consequence of his sympathy with the doctrines of the Puritans. He settled in Cambridge, was soon after appointed a captain of militia, and in 1656 became superintendent of all the Indians who had submitted to the government of Massachusetts, an office which he held till his death. He protected the fugitive regicides in 1661, was appointed one of the two licensers of the Cambridge printing press in the following year, became unpopular during King Philip's war by the protection which, as a magistrate, he extended to the Indians, and in 1681 was made major-general of the colony. His 'Historical Collections of the Indians of Massachusetts' bears the date of 1674, and was first published by the Massachusetts Historical Society in 1792. He is said to have written also a history of New England, of which no manuscript has been found.

Goorkhas, goor'kaz. See GHURKAS.

Goosan'der. See MERGANSER.

Goose. See GEESE.

Goose-barnacle. See BARNACLE; BERNACLE-GOOSE.

Goose-fish, or Angler, a marine fish (*Lophius piscatorius*) of the order *Pediculati,* with an enormous head and mouth, no scales, and brightly colored fringes about the jaws, which serve as lures to attract within reach the small fishes on which it preys; the first three rays of the dorsal fin are separated from the others, and spring barbel-like from the top of the head, nodding in the water and attracting other small fishes,— hence the name "angler." Like all fishes of its order, the carpal bones are elongated to strengthen and widen the reach of the pectoral fins, by means of which the fish leaps after its prey. The angler is popularly supposed to catch geese and other swimming birds, whence its name. It reaches a length of four feet, but is useless, and the bane of fishermen. It is remarkable for its pinkish ribbon-like masses of eggs, a foot wide, 40 feet in length, which are not uncommon in summer floating at the surface of the ocean. The goose-fish occurs on both coasts of the North Atlantic and has other names, as "fishing-frog," and "all-mouth." Near relatives are the batfish and the frog-fishes.

Goose-grass, or Gosling-weed, two of the many names applied to a widely distributed troublesome weed (*Gallium aparine*). See BEDSTRAW; CLEAVERS.

Gooseberry, goos'- or gooz'bĕr-ĭ, various spiny shrubs of the genus *Ribes,* natural order *Saxifragaceæ* or *Grossulariaceæ,* mostly natives of the northern hemisphere, especially of North America; some species valued for their fruit (berries), others for their flowers. Of the half dozen species cultivated, the European gooseberry (*R. grossularia*), which appeared in gardens during the 16th century, has developed the largest number of varieties and attracted the widest interest. Its progeny furnish practically all the varieties exhibited at the annual gooseberry shows of England. The fruits of some of these varieties weigh more than an ounce, having been developed by selection and crossing from an original weight of about one quarter of an ounce. The varieties may be divided, like apples or pears, into culinary and dessert sorts. They have not proved generally successful in America, the climate being considered too dry for them. Of the American species, several of which bear finer fruits than the natural European species, *R. oxyacanthoides* is the only one that has produced widely cultivated varieties. It has also entered into many hybrids with the European species. These American varieties are all of the culinary class, or are used while too unripe to be palatable as dessert. The first one, Houghton, was introduced about 1835, and with its seedling, Bowning, still commands the market. In America attention has not been attracted to the gooseberry because the American people have not cultivated a taste for dessert gooseberries. Of the ornamental species, *R. speciosum* is cultivated for its nearly evergreen shining foliage and its fuchsia-like showy flowers. It is not hardy in the northern United States.

The gooseberry is one of the easiest fruits to propagate. Cuttings of mature wood are most frequently used, but layers and suckers are also employed. The plants thrive best upon rather heavy, moist soil, and generally fail upon light soils, especially if dry. They like partial shade and northern exposures. In the South they fail. The plants may be transplanted in spring or fall, about 5 feet apart each way, cultivated frequently until mid-summer, trained and pruned like the currant (q.v.), but somewhat more openly, kept free from fungous troubles by the use of a fungicide (q.v.) and of insects by the use of an insecticide (q.v.). The fungi most frequently found upon the plants are mildew (*Sphærotheca mors-uvæ*) and leaf spot (*Septoria ribis*). The former, which is a surface feeder, appears upon the green parts as a frost-like gray growth, which later becomes brown. Free circulation of air, good drainage and open training of the bushes helps to prevent attacks. Leaf spot produces brown spots upon the foliage, which may fall prematurely. Spraying early in the season is believed to be the only preventive. With few exceptions, the insects that attack the gooseberry also visit the currant (q.v.) and may be combated by the same remedies. Consult: Card, 'Bush Fruits' (New York 1898); Thory, 'Monographie ou Histoire Naturelle du Genre Grosseillier'; Bailey, 'Cyclopædia of American Horticulture' (1900–2).

Gooseberry Insects. See CURRANT-INSECTS.

Goosefoot, a family (*Chenopodiaceæ*) of annual or perennial herbs, rarely shrubs, with 75 to 80 genera and 550 to 600 species, of wide distribution. The typical genus (*Chenopodium*) contains about 60 species, 15 or 20 of which are native to North America, or have been naturalized, some of them almost ubiquitous weeds, such as the pigweed (*C. album*); the city goosefoot (*C. urbicum*), thriving in suburban lots and roadways; the sowbane (*C. murale*); the turnpike or feather-geranium or Jerusalem oak (*C. botrys*); the now world-wide Mexican tea (*C. ambrosiodes*); and the wormseed (*C. anthelminticum*), from which is brewed a home-made vermifuge. Other genera contain allied weeds, as the strawberry blite (*Blitum capitatum*); the large genus (*Atriplex*) of sea-side and salt-land weeds called oraches; the western white sage (*Eurotia lanata*), a gray-green, pubescent fodder plant of the western plains; the sea-blites (*Dondia*) and odd brittle glass-worts of salt marshes; and the spiny grease-wood and Russian thistle (qq.v.). See CHENOPODIUM.

Go'pher, a name given by the early French settlers in the United States to various animals which honeycomb (Fr. *gaufre*) the ground by burrowing in it. In the Central States the name refers to the too common "striped" gopher, or ground-squirrel (*Spermophilus tridecemlineatus*), a troublesome little animal about 10 inches long, a third of which is tail, which is dark-reddish brown, with 6 to 8 light stripes, alternating with lines of dots — about 13 in all: it is yellowish below, with a broad black stripe on each side. It is a familiar object on prairies and grassy fields throughout the upper half of the Mississippi valley, hurrying to and from its hole, or standing upright, but inconspicuous, curiously watching your movements, but ready to drop out of sight at the least alarm. The burrows are numerous everywhere, and are injurious not only by the space they occupy, and as traps for the feet of horses and cattle, but because they offer run-

ways for water and so promote washing away of soil. Some of the holes are short, and are merely shelters; others are long, have a nest at the inner extremity, and side-chambers in which in the autumn large winter stores of seeds are laid away. Where these spermophiles are very numerous, as they have become in the grain-growing districts, of Iowa, Minnesota and the Dakotas, the amount of grain stolen or shaken down is a serious tax on agriculture. Another spermophile, more common northward, is Franklin's or the "gray" gopher (*S. franklini*), which is much larger and has a harsh coat of yellowish-grizzled hair. Several other species inhabit the more western plains. All are truly ground-squirrels of the family *Sciuridæ,* and closely related to the chipmunk (q.v.).

In the farther Northwest, however, the word "gopher" ordinarily means one of the large gray rodents of the family *Geomyidæ,* distinguished prominently by having in the cheeks capacious pouches, lined with fur; hence they are called pocket-gophers and pouched rats. The most familiar species is *Geomys bursarius,* which is about nine inches long and has short legs, close ears and a short hairy tail; the fore feet are very strong, with the three middle toe-nails long and well-adapted to digging, and its burrows are made with surprising rapidity. Its food includes all sorts of vegetable matters, and it often injures orchards by gnawing the roots. As fall approaches it gathers a store of seeds, tuberous roots, nuts, etc., and stows it in its deep residence-burrow, where the winter is passed in a partial torpidity varying with the climate. These provisions are carried in the cheek-pouches, which also serve to take out the loose soil from the burrows. On the Pacific coast occur several other species, some with large, pendent cheek-pouches. In the Southern States is found a species (*G. tuza*), locally called "Salamander," of large size and common in the sandy parts of Florida and the country north of it. The Northwest has a second and smaller kind of gopher (*Thomomys talpoides*), dusky bluish-gray in color, with the lower parts whitish, which is mole-like in its habits, and is known in Idaho as "camass-rat," on account of its fondness for the tubers of the liliaceous plant called camass (*Camassia esculenta*) by the Indians.

All of these animals are a pest to agriculture, and are increasing rather than diminishing in settled regions, owing partly to the increased food afforded them by crops, and partly to the destruction of their natural enemies, the birds of prey, snakes, weasels, foxes, badgers, wolves, etc., which formerly held them in check. Efforts are therefore made to exterminate them in various ways, of which the most effective is by suffocating them with bisulphide of carbon, placed in their holes by saturating some porous object and rolling it into the burrow. Several pamphlets issued by the United States Department of Agriculture describe the animals and their habits, and give directions for their suppression.

Gopher Snake, or **Indigo Snake,** a variety of a tropical colubrine snake (*Compsosoma corais*) common in the southwestern United States and eastward to Georgia, which reaches a length of 10 feet, and is brownish black with reddish markings about the mouth and throat. It burrows beneath loose soil, is harmless to man, and is believed to prey upon rattlesnakes at every opportunity.

Gopher State, a name sometimes given to Minnesota.

Gopher Tortoise or **Turtle,** a burrowing turtle (*Xerobates polyphemus*) of the southern United States, brownish in color with black head; yellowish below. It is herbivorous and gregarious, and is most frequently found in the pine barrens, where it is frequently eaten by the negroes, who are also fond of its eggs.

Go'ral, a goat-like antelope (*Nemorrhædus goral*) from the Himalaya Mountains. It resembles somewhat the chamois, and remains in small bands on the highest parts of the mountains. Other species or varieties inhabit the high plateaus of Tibet and Mongolia.

Goramy, gō'ra-mĭ, or **Gourami,** goo'ra-mĭ, the Javanese name of a fish of the genus *Osphromenus* (*O. olfax*), family *Anabasidæ* or climbing perches, a native of China and the Eastern Archipelago, but introduced into the Mauritius, West India Islands, and Cayenne on account of the excellence of its flesh, where it has multiplied rapidly. It is deep in proportion to its length, and the dorsal and anal fins have numerous short spines, while the first ray of the ventral is protracted into a filament of extraordinary length. It is one of the few fishes which build nests, which it does by interweaving the stems and leaves of aquatic plants.

Gordiacea, gôr-dĭ-ā'sē-a, an order of *Nematohelminthes,* the hair-worms (q.v.).

Gordian Knot, a knot tied by Gordius in the rope which bound the yoke of his chariot to the axle-tree in such an artful manner that the ends of the cord could not be perceived. The Phrygians had learned by an oracle that a king would come to them riding in a car, and Gordius appearing thus at an opportune time, received the kingdom. He dedicated his car and yoke of oxen to Zeus, with the knot still untied. So intricate was it that the report went abroad that the empire of Asia was promised by the oracle to him who could untie it. Alexander the Great, wishing to inspire his soldiers with courage and his enemies with the belief that he was born to conquer Asia, cut the knot with his sword, and so claimed to have fulfilled the oracle. Hence to "cut the Gordian knot" is equivalent to removing or solving a difficulty by bold or unusual measures.

Gordia'nus, Marcus Antonius, the name of three Roman emperors, father, son, and grandson. The first, b. 158 A.D., had governed Africa for many years, when he was proclaimed emperor at the age of 80. He associated his son with him in the empire, but six weeks later the son was killed in fighting against the rival emperor Maximinus, and the father, in an agony of grief, died by his own hand. The grandson was proclaimed emperor by the soldiers in Rome 238 A.D., although not more than 15. He reigned six years, when he was assassinated by his soldiers at the instigation of Philip, prefect of the Prætorian guard.

Gordon, Archibald D., American dramatist: b. Ceylon 11 Oct. 1848; d. Port Richmond, Staten Island, N. Y., 9 Jan. 1895. He was dramatic critic for several New York and Chi-

cago journals, and published: 'Trixie'; 'The Ugly Duckling'; 'Is Marriage a Failure?'; 'That Girl from Mexico.'

Gordon, Charles George («CHINESE GORDON» or «GORDON PASHA»), English soldier: b. Woolwich 28 Jan. 1833; d. Khartum, Africa, 27 Jan. 1885. He entered the Royal Engineers as second lieutenant in 1852, and served in the Crimean war and during the Taiping rebellion, with the permission of the English military authorities, assumed the command of a special corps of Chinese, trained and led by European and American officers. With these materials he performed marvelous feats of skilful soldiership and succeeded in completely crushing the rebellion. The Chinese government was eager to express its gratitude, but he refused all offers of substantial reward. On his return to England with the rank of colonel, he was appointed chief engineer officer at Gravesend for the construction of the Thames defenses. Here, while his engineering work afforded ample scope for his military talents, the philanthropy of his nature had full scope. During the six years he lived at Gravesend his house was school, and hospital, and almshouse in turn. Many a waif he rescued from the gutter, establishing evening classes for their benefit, and keeping sight of the more deserving till they were provided with a career in life; all this being done on his pay as an English colonel, without any private resources whatever. In 1873, on the resignation by Sir Samuel Baker of his command, Gordon was appointed in his place, under the khedive of Egypt, and from 1874 until 1879 governed the vast region of the Sudan with credit to himself and with satisfaction to the Cairo administration. In 1881 Mohammed Ahmed, a Mussulman enthusiast, gave himself out to be the Mahdi — the long-expected Redeemer of Islam — and gathered a number of followers around him who threatened the safety of the Egyptian garrisons in the Sudan. It having been decided that the Sudan be evacuated, the presence of an English officer of high authority at Khartum was asked, with full power to withdraw all the garrisons in the Sudan, and make the best arrangements possible for the future government of the country. Gordon, at the request of the British government, proceeded to the Sudan in the hope that his great personal influence and knowledge of the country would help to set matters right. These hopes were not fulfilled; Gordon was shut up in Khartum by the troops of the Mahdi, and for a whole year he held that town against the Arabs who surrounded him. An English force under Wolseley was despatched for his relief, an advance corps of which sighted Khartum on 28 Jan. 1885, to find that the town had been treacherously betrayed into the hands of the Mahdi two days before, and that its heroic defender had been killed. Gordon had all the qualities which are found in a successful military leader, modified, however, by the strong religious feeling which tinged his mind from an early period, and which latterly became so intensified as to give him somewhat the character of a religious enthusiast and fatalist. He left a most interesting journal, kept during the latter period of his siege in Khartum. Consult: Hill, 'Gordon in Central Africa' (1881); Lives by Forbes (1884); Henry Gordon (1886); Boulger (1896).

Gordon, Charles William («RALPH CONNOR»), Canadian author: b. Indian Lands, Glengarry, Ont., Canada, 1860. He was graduated at Toronto University in 1883 and at Knox College in 1887; was ordained to the Presbyterian ministry and was a missionary in the mining and lumbering regions of the Rocky Mountains 1890–4. He became pastor of St. Stephen's Church of Winnipeg in 1894, and wrote: 'Beyond the Marshes'; 'Black Rock'; 'Gwen's Canon'; 'The Sky Pilot'; 'Ould Michael'; 'The Man from Glengarry'; 'Glengarry School Days'; and 'The Prospector' (1904), works characterized by vivid descriptions of life and scenery in the Canadian West.

Gordon, LORD George, English agitator: b. London 26 Dec. 1751; d. there 1 Nov. 1793. He was a son of the Duke of Gordon, and entered Parliament in 1774. In 1778, a bill having been passed through Parliament for the relief of Roman Catholics from certain penalties and disabilities, a society called the Protestant Association of London was formed for the purpose of procuring its repeal. In the following year Lord George was elected its president, and in June 1780 headed an excited mob of about 100,000 persons, who went in procession to the House of Commons to present a petition against the measure. The dreadful riot which ensued, and which was not suppressed till after the destruction of many Catholic chapels and dwellings, the prison of Newgate, and the house of the chief justice, Lord Mansfield, led to the arrest of Lord George Gordon, and his trial on the charge of high treason; but no evidence being adduced of treasonable design, he was acquitted. He died, after having become a zealous professor of the Jewish faith.

Gordon, George Henry, American soldier: b. Charlestown, Mass., 19 July 1824; d. Framingham, Mass., 30 Aug. 1886. Graduated from West Point in 1846, he was employed on various duty, later resigned from the army, and practised law 1857–61. In 1861 he organized the Second Massachusetts Volunteers, and became colonel of the regiment. He commanded the United States troops in Florida in 1864, the eastern district of Virginia in 1865, and was mustered out in the latter year with rank of brigadier-general and brevet major-general of volunteers. He wrote a 'History of the Second Massachusetts Regiment' (1876), and other works on the war.

Gordon, John Brown, American soldier: b. Upson County, Ga., 6 July 1832; d. near Miami, Fla., 9 Jan. 1904. He was of Scotch ancestry, his grandfather being one of seven brothers who all fought for American independence in the War of the Revolution. He was graduated at the State University in 1852 and was, a few months later, admitted to the practice of law; but at the outbreak of the Civil War was engaged in mining operations near Raccoon Mountain, Alabama. Here was organized a company, called the «Raccoon Roughs,» of which he was elected captain. This company was assigned to the 6th Alabama infantry, in which he rapidly rose through successive grades to that of colonel (28 April 1862). At Seven Pines, through the wounding of General Rodes, the command of the brigade fell upon him; and at Malvern Hill he led it in the grand charge of D. H. Hill's division against the Federal posi-

tion. At Sharpsburg he was five times wounded. On 1 Nov. 1862 he was commissioned brigadier-general with command of a Georgia brigade of six regiments, which he led with great distinction at Chancellorsville and Gettysburg. On the march into Pennsylvania, just before the battle of Gettysburg, he reached Wrightsville on the Susquehanna, making the most extended advance achieved in the East by Confederates during the war. On the first day at Gettysburg he struck the extreme right of the Union army in Ewell's grand turning movement, by which the victory so desperately striven for by A. P. Hill was secured, and the Federals were driven through the town of Gettysburg to the heights beyond. On 6 May 1864, in the Wilderness leading two brigades, he fell at sunset upon Sedgwick's corps, driving the Federals from a large part of their works and capturing 600 prisoners, including Generals Seymour and Shaler.

On 12 May at Spottsylvania Court House, commanding Early's division, immediately after Hancock had overwhelmed Edward Johnson, Gordon by an impetuous charge first checked the Federals and then drove them back to the base of the salient, where the fight continued with great fury to the close of the day. Two days later Gordon was commissioned major-general and placed in command of Evans' Georgia brigade, Hays' and Stafford's Louisiana brigades, and Terry's Virginia brigade — the latter being made up of the remnants of the "Stonewall" brigade and other Virginia troops. With this command he participated, under Early, in the defeat of Hunter's expedition, the invasion of Maryland, the victory at the Monocacy, the march into the suburbs of Washington, and the battles against Sheridan in the Shenandoah Valley, being especially distinguished in the surprise and rout of Sheridan's army in the early morning at Cedar Creek. Having been assigned to the command of the Second corps of the Army of Northern Virginia, he held his lines with great tenacity, and in March 1865 made the brilliant dash by which he captured Fort Steadman and parts of the line to the right and left of it. Owing to the failure of the supporting column to arrive in time, he was obliged to retire to his original position. On the retreat from Petersburg he protected the rear, and at Appomattox commanded half of Lee's army, making a last brilliant charge of that heroic but now fearfully depleted host. After the surrender he called his men about him and made them a speech remarkable for its strong declarations of faith in God and earnest exhortations to endure defeat with patience, obey the laws, and rebuild their ruined homes and fortunes. He became the trusted leader of his people, was twice elected governor of Georgia, and for two terms represented his State in the Senate of the United States, on all occasions using his influence for peace and fraternity between the late warring sections. As commander-in-chief of the United Confederate Veterans' Association he possessed the enthusiastic love and devotion of his comrades, who would never entertain the idea of his retirement from the office to which they every year elected him, declaring repeatedly that death alone could remove him from that post of honor. His very successful lecture on 'The Last Days of the Confederacy' was well known in both North and South. His war-time reminiscences began to appear in 'Scribner's Magazine' in 1903 and were later published in book form.

Joseph T. Derry,
Author of 'The Story of the Confederate States.'

Gordon, Joseph Claybaugh, American educator: b. Piqua, Ohio, 9 March 1842. He was the earliest American advocate of oral education for the deaf and in 1869 organized the oral department of the Indiana Institution for the Deaf. He was professor of mathematics and chemistry in Gallaudet College, Washington, 1873–97, becoming superintendent of the Illinois Institution for the Education of the Deaf in the last named year. He has published: 'Education of Deaf Children'; 'Notes and Observations on the Education of the Deaf'; etc.

Gordon, Julien. See Cruger.

Gordon, William W., American soldier: b. Savannah, Ga., 14 Oct. 1834. Graduated from Yale in 1854, he served in the Confederate army during the Civil War, distinguishing himself at the battle of Frederick City, Md., and subsequently was in the cotton trade at Savannah. He was for six years a member of the State legislature of Georgia, was brigadier-general of volunteers in the Spanish-American war (mustered out 1899), and was appointed to the evacuation commission for Porto Rico.

Gordon-Cumming, Constance Frederica. See Cumming, Constance.

Gore, Christopher, American statesman: b. Boston 21 Sept. 1758; d. Waltham 1 March 1827. He was graduated at Harvard College in 1776, and studying law, was soon engaged in good practice. In 1789 he was appointed the first United States district attorney for Massachusetts; in 1796 was chosen one of the commissioners to settle the claims of the United States upon Great Britain for spoliations, and remained in London, successfully engaged in the duties of this office, about eight years. In 1803 he acted as *chargé d'affaires* during the absence of the American minister; in 1809 was chosen governor of Massachusetts; and in 1814 was elected to the United States Senate. He left about $100,000 to Harvard College. Gore Hall, the library building at Harvard, is named in his honor.

Gorgeana, gôr-jē-ăn'a, Me., now York, the first incorporated city in the United States. On 2 Dec. 1631 a grant was made to Sir Ferdinando Gorges and others of 24,000 acres on both sides of the Accomenticus (Agamenticus, now York) River. Settlements were founded here, and on 10 April 1641 were formed into a borough named Accomenticus or Agamenticus which on 1 March 1642 was given a city charter as Gorgeana, with a full apparatus of mayor, aldermen, courts, etc. It had an extent of three miles on the coast and seven up the river, a small tidal stream. In 1652 Maine submitted to Massachusetts; and to avoid the city charter and Gorges' rights, Gorgeana was reincorporated as the town of York.

Gorges, gôr'jĕz, Sir **Ferdinando,** colonial proprietor of Maine: b. Ashton, Somersetshire,

about 1565; d. 1647. He was a partner in the conspiracy of the Earl of Essex, against whom he testified on his trial in 1601. When Waymouth returned in 1605 from his voyage to North America, and brought with him five Indian captives, Gorges took three of them into his house, caused them to be instructed in the English language, obtained information from them of the "stately islands and safe harbors" of their native country, and determined to become a proprietor of domains beyond the Atlantic. He persuaded Sir John Popham, lord chief justice of England, to share his intentions, and in 1606 the king incorporated two companies, the London colony, and the Plymouth colony, between which was divided the territory extending 50 miles inland from the 34th to the 45th parallel north latitude. The Plymouth colony had the northern portion, which was styled North Virginia. Three ships with 100 settlers sailed from Plymouth 31 May 1607, and reached the mouth of the Kennebec in Maine, where they began a settlement, abandoned the next spring. In 1616 Gorges sent out Richard Vines with a party, which encamped on the river Saco through the winter. In 1620 Gorges and his associates obtained a new incorporation for "the governing of New England in America," which was empowered to hold territory extending westward from sea to sea between the 40th and 48th parallels north latitude. Gorges himself united with John Mason in taking grants of the district called Laconia, bounded by the Merrimack, the Kennebec, the ocean, and "the river of Canada," and under his auspices several settlements were attempted. His son, Robert Gorges, was appointed in 1623 by the council for New England "general governor of the country." This council resigned its charter to the king in 1635, and the elder Gorges now determined to establish a miniature sovereignty on his own domain. To this end he obtained from the king a charter constituting him lord proprietary of the province of Maine, with extraordinary governmental powers, to be transmissible with the property to his heirs and assigns. He sent his son Thomas to be deputy governor, and the officers took an oath of allegiance to the lord proprietary. The province was divided into two counties, of which Agamenticus (now York) and Saco were respectively the principal settlements; the former received a city charter, as Gorgeana, in 1642. But the fatal want was a deficiency of subjects; probably two thirds of the adult males were in places of authority; yet the little monarchy continued for nearly 10 years. When the four New England colonies formed a confederacy in 1643, the settlements of Gorges were excluded from it. On Gorges' death his colonists at length formed themselves into a body politic for the purposes of self-government, and submitted to the jurisdiction of Massachusetts. "The nature of Gorges," says Bancroft, "was generous, and his piety sincere. He sought pleasure in doing good, fame by advancing Christianity among the heathen, a durable monument by erecting houses, villages, and towns."

Gorgias, gôr'jĭ-as, Greek orator and sophist: b. Leontini, in Sicily. He flourished in the 5th century B.C., and was one of the earliest writers on rhetoric. He was one of the first who introduced cadence into prose. He also treated of common-places, and showed the use of them for the invention of arguments. This induced Plato to give the name of 'Gorgias' to his elegant dialogue on this subject. Gorgias is said to have reached the extraordinary age of 107 or 108 years. Two works attributed to him are extant, 'The Apology of Palamedes,' and the 'Encomium on Helena,' but their genuineness has been questioned by several critics. See Jebb, 'Attic Orators.'

Gorgo, gôr'gō, or **Gorgon**, according to Homer, one of the frightful phantoms of Hades; but Hesiod mentions three Gorgons, Stheno, Euryale, and Medusa. They were all immortal, except Medusa. Their hair was entwined with serpents, their hands were of brass, their body covered with impenetrable scales, their brazen teeth as long as the tusks of a wild boar, and they turned to stones all those who looked upon them. According to some authors, Perseus, when he went to the conquest of the Gorgons, was armed with an instrument like a scythe, by Hermes, and provided with a looking-glass by Athena, besides winged shoes and a helmet of Pluto, which rendered all objects clearly visible and open to the view, while the person who wore it remained totally invisible. With weapons like these Perseus obtained an easy victory. The head of Medusa remained in his hands, and he gave it to Athena, who placed it on her Ægis, with which she turned into stones all such as fixed their eyes upon it. The residence of the Gorgons was beyond the ocean toward the west, according to Hesiod.

Gorgo'nia, the type-genus of the *Gorgonidæ*, a family of alcyonarian coral-polyps, the "sea-fans" or "sea-whips," which have a calcareous or horny axis, the colony often greatly branched, and the branches anastomosing. In the common gorgonia (*Rhipigorgia flabellum*) of the West Indies and Florida Keys the branches form a flat net-work. In this and other sea-fans the short calicles of the single retractile polyps stand perpendicularly to the axis, communicating by longitudinal vessels and branching canals. While by far the greater majority of the species are inhabitants of tropical waters, in the Arctic seas, and in the deeper, cold waters of the Newfoundland banks, and on St. George's Bank, two large species occur: *Primnoa reseda* and *Paragorgia arborea*; the latter is of great size, the stem being as thick through as a man's wrist, and the entire coral-stock over five feet in height.

Goril'la. This term is derived from the 'Periplus' of the Carthaginian navigator, Hanno, who described, 500 years before Christ, an island on the west coast of Africa as full of wild men, which his interpreter called Gorilloi. When, therefore, Dr. Thomas Savage brought the first specimen of this animal to the attention of science, in 1847, the name "gorilla" was naturally applied to it. It now appears probable that the "Gorilloi" of Hanno were probably baboons. The gorilla of science, of which but one species is known (*Gorilla gorilla*), is the largest of the apes and is of great interest, since with the chimpanzee and the orang-outang, it is the nearest living relative of man. Structurally it is very closely allied to the chimpanzee. It does not exceed 5½ feet in height, but in bulk con-

siderably exceeds man. Its skin is black, the hair being blackish and turning gray in old individuals. The skull has the supraorbital ridges greatly developed and the crest in the sagittal line is large. The arms are long, the hand reaching to about the middle of the shank, while the hands are webbed to the end of the first joint of the fingers. In the foot the heel is more apparent than in other anthropoid apes, correlated with its more terrestrial life. They usually walk upon all fours, a gait rendered possible by the very long arms.

These apes are limited in their distribution to the forested region of the Gaboon, and go about in families led by an old male. They are mainly diurnal in their habits, seeking their food, which is largely vegetable, during the day. At night the female and young are said to ascend a tree while the male sleeps at its foot. The stories told of its ferocity are possibly exaggerated, yet it is without doubt an extremely dangerous animal when brought to bay. When making an attack the male stands erect and is said to knock his adversaries down with his hand and then to use his powerful teeth, the canines of which are greatly developed. Consult: Keith, 'Proceedings Zoological Society of London' (1899); for accounts of its habits: Huxley, 'Man's Place in Nature'; H. O. Forbes, 'Monkeys' (1894); and Hartmann, 'Anthropoid Apes' (1885).

J. S. Kingsley,
Professor of Zoology, Tufts College.

Gor'ky, Maxim, pen name of Alexei Maximovitch Pyeshkoff, Russian author: b. Nijni Novgorod 1868. He traveled over a large part of his native country as a tramp after serving in many employments from that of a ship's cook to that of a lawyer's clerk. The varied scenes and persons he saw in his vagabond life among the lowest of the population furnished him with rich material for his subsequent literary work, in which he takes upon himself to interpret *la misère* as it is in western and southwestern Europe. His style is like a flash-light revealing features of debased or tragic character with vivid realism, but his view of his subject is tinged with melancholy pessimism. Among his most admired works are: 'Foma Gordyeeff' (1902); 'Makar Chudra' (1892).

Gor'man, Arthur Pue, American legislator: b. Howard County, Md., 11 March 1839. Up to his 27th year he was a page in the United States Senate. He was then appointed Collector of Internal Revenue in the Fifth District of Maryland. In 1869 he was made general superintendent of the Chesapeake and Ohio Canal Company. Since 1872 he has been president of that corporation. His influence as a Democrat has extended from the affairs of Maryland to those of the United States in general, and from the House of Delegates in his native State he was elected in 1893 to serve as Senator of the United States; to which office, after three years of private life, he was re-elected in 1902. He was prominent in opposing the Force Bill of 1889 and took part in the reframing of the Wilson Tariff Bill in 1894.

Gorringe, gôr'rĭnj, **Henry Honeychurch,** American naval officer: b. Barbadoes, W. I., 11 Aug. 1841; d. New York 6 July 1885. He came to the United States in youth, entered the Union navy in 1862, and served under Admiral Porter. He was promoted lieutenant-commander in 1865. He accomplished the removal of the Egyptian obelisk (Cleopatra's Needle), which the khedive had presented to the United States, from Egypt to New York city in 1880. He published a 'History of Egyptian Obelisks' (1885).

Gorse, or **Whin.** See Furze.

Gortchakoff, gŏr-chä-kof', **Alexander Mikhail'ovitch,** Russian diplomatist; cousin of the general of the same name: b. St. Petersburg 16 July 1798; d. Baden-Baden 1 March 1883. He entered the diplomatic service in 1824 as secretary to the Russian embassy in London. His experience in diplomacy was extended in Vienna, Florence, Stuttgart, and elsewhere, and he showed great skill in securing the neutrality of Austria during the Crimean war. In 1856 he became minister of foreign affairs, and in 1862 chancellor of the empire, having by that time made himself one of the foremost diplomatists of Europe. He was a prominent member of the Berlin Congress 1878, but his influence was then on the decline, and in 1882 he was superseded by M. de Giers.

Gortchakoff, Prince **Mikhail,** Russian general: b. 1795; d. Warsaw 30 May 1861. He took part as an artillery officer in the battle of Borodino in 1812, and served in the subsequent campaigns of the allies against the French. He acquired also a brilliant reputation in the Polish war of 1831; and in 1846 he was made governor of Warsaw. In 1855 he was appointed commander-in-chief in the Crimea, where he conducted the defense of Sebastopol. In 1856 he returned to Poland as governor of the country. By his express desire his body was carried to Sebastopol, and buried in the place he had so long and so bravely defended.

Gor'ton, Samuel, New England enthusiast, and first settler of Warwick, R. I.: b. Gorton, England, about 1600; d. Rhode Island November or December 1677. He did business in London as a clothier until 1636, when he embarked for New England, and settled at Boston. Religious disputes induced him to remove to Plymouth, where we first hear of him as a preacher. He soon exhibited such peculiar views that he was banished from the colony on a charge of heresy. With a few followers he then went to Aquetneck or Rhode Island, which had recently been settled by exiles from Massachusetts Bay; but falling again into trouble, was publicly whipped for calling the magistrates "just asses" and for other contemptuous acts, and was forced to seek an asylum with Roger Williams in Providence, about 1641. Here he became involved in the disputes of the colonists on certain questions of boundary. Gorton was then summoned to Boston, but refused to recognize the jurisdiction thus assumed, and about the same time removed to Shawomet, on the west side of Narragansett Bay, where he purchased land from the Sachem Miantonomo. But in June 1643 two inferior sachems contested his claims to the land, and applied to the general court at Boston for assistance. A body of 40 soldiers was consequently marched to Shawomet, and Gorton and 10 of his disciples were carried to Boston and condemned to hard labor, a sentence commuted to banishment in 1644. Gorton then went to

England, where he obtained from the Earl of Warwick an order for the land he claimed. Returning to Rhode Island in 1648 he founded the town of Warwick, thenceforth his home, and where he occasionally preached. He wrote several controversial works, the best known of which is 'Simplicitie's Defense Against Seven-Headed Policy' (1646). See Janes, 'Samuel Gorton' (1896).

Goschen, gō'shĕn, **George Joachim,** Viscount, English financier: b. of German extraction London 10 Aug. 1831. He was educated at Oxford and entered Parliament as a Liberal for the city of London in 1863, which he represented till 1880. He was First Lord of the Admiralty, 1871–4. With M. Joubert he went to Egypt in 1876 on behalf of the bond-holders to reorganize the finances of that country, and two years afterward represented Great Britain at the international monetary conference held in Paris. In 1887 he became chancellor of the exchequer under Lord Salisbury, and in 1895 again took office under the same leader as First Lord of the Admiralty. From this office he retired toward the end of 1900, and was soon after raised to the peerage as Viscount Goschen. He represented Ripon in Parliament 1880–5, when he was returned for Edinburgh, and was member for St. George's, Hanover Square, 1887–1900. He is author of several financial and political pamphlets, and of a well-known work on the 'Theory of Foreign Exchanges' (1864).

Gos'hawk, a falcon of the genus *Astur*. The goshawk proper, or "gentle falcon" (*A. palumbarius*), was a favorite bird in falconry (q.v.), and is still used for large game, as rabbits, pheasants, and the geese from which it took its name. It is 21 inches in length, the crown, black, bordered on each side by a line of white, finely speckled with black; upper parts, slate, tinged with brown; legs, feathered half-way down, and, with the feet, yellow; tail-feathers with pale bands. It is to be found throughout Europe and central Asia; and it is a question whether the American goshawk (*A. atricapillus*) is really specifically different. The latter is a noble bird whose home is in the North, so that it is rarely seen south of the Canadian line except in winter, and uncommonly then. In its boldness, its marvelous power and control of flight, and its prey, it resembles our more familiar little falcons, the sharpshin and Cooper's hawk. Several other species inhabit the Orient, an Australian one being remarkable for its pure white color, with red irides.

It should be noted that the bird called "goshawk" in Scotland is the peregrine.

Goshen, Ind., city, county-seat of Elkhart County; on the Elkhart River, and on the Cleveland, C., C. & St. L., and the Lake Shore & M. S. R.R.'s; about 25 miles southeast of South Bend and 95 miles southeast of Chicago. It is situated in a fertile agricultural section of the State. Its principal industrial establishments are flour-mills, bicycle and machine shops, woolen-mills, sash and door factories, veneering and furniture shops; rubber goods, underclothing, mittens, and shirts are manufactured here. The city has large lumber, coal, and brick yards. Hay, grain, and live stock are the chief farm products shipped from Goshen to larger markets. The public library building and the high-school are the principal public buildings. The mayor holds office for two years. The city owns and operates the electric light plant and the waterworks. Pop. (1900) 7,810.

Goshen, N. Y., a village, railroad junction, and one of the county-seats of Orange County; on the New York, L. E. & W. and the Lehigh & N. E. R.R.'s; 59 miles northwest of New York. Goshen was founded in 1714, and incorporated in 1809; it has municipal waterworks. The manufactures include bricks, tiles, glass, cider, and foundry products, but the chief commercial interests are connected with the dairying industry, there being a considerable trade in milk, butter, and cheese, which are widely celebrated for their excellence. Pop. (1900) 2,826.

Gosling-grass. See Bedstraw.

Gosnold, gŏs'nōld, **Bartholomew,** English voyager to America: d. Jamestown, Va., 22 Aug. 1607. He joined Raleigh in his attempt to colonize Virginia, and after the failure of that enterprise was placed in command of an expedition fitted out at the cost of the Earl of Southampton and others for planting a settlement in New England. He sailed from Falmouth 26 March 1602, with one small vessel and a company of 32 persons, 20 of whom were colonists. Steering directly across the Atlantic, in seven weeks he reached Massachusetts Bay, first seeing land probably not far north of Nahant. Thence he turned south and landed on Cape Cod, to which he gave the name it still bears. Sailing around the promontory, and stopping at the island now known as No Man's Land, but which he called Martha's Vineyard, Gosnold anchored at the mouth of Buzzard's Bay, and resolved to plant his colony on an island which he called Elizabeth, and which now bears the Indian name of Cuttyhunk. The adventurers here built and fortified a house, but the hostility of the Indians, scarcity of provisions, and disputes about a division of the profits, disheartened them, and the whole party returned to England, taking a valuable cargo of sassafras root, then highly esteemed as a medicine, cedar, furs, and other commodities. Gosnold next turned his attention toward Virginia, and after long effort succeeded in organizing a company for colonization in that region, the heads of which were Edward Wingfield, Robert Hunt, and the famous Capt. John Smith. A charter was granted them by James I., 10 April 1606, the first instrument of that nature under which the English were planted in America; and on 19 Dec. 1606 Gosnold set sail with three small vessels and an ill-assorted band of 105 adventurers, only 12 of whom were laborers, and very few mechanics. After a tedious voyage, a storm having driven them into Chesapeake Bay (26 April 1607), they sailed up James River, which they named after the king, disembarked about 50 miles above its mouth, and founded the settlement of Jamestown. Sickness and various disasters destroyed 50 of their number before autumn, among whom was the projector of the colony. The Massachusetts township of Gosnold, comprising the Elizabeth Islands, was named in his honor.

Gospels. Our four gospels cannot perhaps be better described than by calling them "Memoirs of Jesus." Though they contain ample historical and biographical materials,

they are neither histories nor biographies, in our modern sense of these terms. Moreover, each one has been written with the distinct purpose of edification. They do not relate facts simply as facts, but always with the object of awakening or strengthening faith. Each Evangelist has selected and arranged his materials in accordance with his conception of the best way to realize this aim. Altogether they give us but a small part of the life and activity of the Master, and yet they contain enough to make clear His character and mission. The recognition of these general characteristics is indispensable in the consideration of the critical questions which are connected with the study of the origin and interrelation of the four Gospels. In distinction from that of St. John, the first three gospels, since the days of Griesbach (latter part of 18th century) have been called "the Synoptics," for the reason that their accounts which are often parallel, give us a general view of the sayings and doings of Jesus. They differ from that of St. John in four particulars: (1) In the scene of Jesus' ministry, St. John confines himself almost entirely to Judea, while they are busy with the ministry in Galilee and the Perea. (2) In the number of Passovers noted. The Synoptics mention only one; St. John, at least three (ii. 13, vi. 4, xii. 1). Hence, so far forth, there seems to be a difference in the duration of the ministry. (3) In the events narrated. Apart from the events of the last or Passion week, St. John gives only three incidents in common with the other Gospels — the feeding of the multitude, vi. 1-13, the walking on the water, vi. 16-21, the anointing of Jesus by Mary of Bethany, xi. 55, xii. 11. (4) In the general teaching of Jesus. St. John's Gospel, as far as its teachings are concerned, deals quite exclusively with the person of Jesus, while the others make known to us the nature of the kingdom which he came to establish. These differences have made the fourth Gospel the subject of much study and speculation, and cause it still to be one of the difficult problems of New Testament criticism.

The Synoptic Problem.— For over 100 years students of the Gospels have been engaged upon the question of the origin and relationship of the Synoptic evangelists. No one can read these gospels attentively without being struck with the general resemblances in the narratives. These resemblances pertain to the place of our Lord's ministry — Galilee, to the time — only one Passover being given, and to the general order of events. More than one half of the incidents are the same in all three, and what is noteworthy regarding these is the close similarity in the language in which the incidents are given. Such facts point to a common relationship of some kind. Together with these resemblances, however, there are just as marked differences. The character as well as number of these differences is striking. What origin can account for both resemblances and differences? This is the Synoptic problem. In the course of the long period of work upon it, three typical solutions have been offered: (1) The solution of inter-dependence. This supposes that the Evangelists copied from one another and there have been as many variations in the form of the theory as there are possible orders of the Gospels. No one of them has proved satisfactory. Out of the discussions that were begotten, however, one important question early became prominent, and that was regarding the Gospel of St. Mark. Did St. Mark make his Gospel by compiling his account from the other two, or was his shorter narrative the basis of St. Matthew's and St. Luke's narrative? Griesbach brought Germany to accept the former view, and for a long time this view stood in the way of any advance in the criticism of the Gospels. That St. Mark is not an epitome or compilation of the other two, is now one of the assured results of criticism. As it became more and more evident from repeated attempts to show it, that the use of one gospel by another in the way of direct copying could not be defended, attention was turned to a possible origin back of them all — to some primitive form of gospel, which would explain all the facts. Hence (2) the solution by the supposition of a primitive gospel. By some (Eichborn, Ewald) this primitive gospel was supposed to be written; by others (Gieseler, Lange, Westcott, Godet) oral. The insurmountable objection to the method of solution by a primitive written source was in the number of translations and recensions postulated in order to account for our gospels in their present form. Eichborn and Ewald supposed nine such stages of work. These theories have proved too intricate and artificial for acceptance. The chief objections to the hypothesis of a primitive oral gospel, as directly the source of our gospels are: (1) That the supposition of some central apostolic tradition formed in or about Jerusalem makes it very difficult to account for the Gospel of St. John. Why did this tradition omit all that is found in the fourth Gospel? (2) "The agreement between the Gospels, in many instances, extends to phrases which are mere connecting links between the sections, which are just the kind that in fully oral tradition would be the first to vary." (3) "The likeness between the Gospels is not confined to agreement in the way of telling separate stories, but extends also to the order of arrangement (ex. Matt. xiv: 1, Mark vi: 14, and the way both narratives go back and explain the statement of the beheading of John). Criticism has not, however, cast away all that these theories have offered us. It is unquestionably true that the gospel existed first in an oral form, and it is also true that the oral gospel was in great part committed to writing before it became the content of our gospels. The solution, therefore, which is to-day accepted by the majority of scholars is that which postulates two main written sources. One of these is called the "Logia," and is attributed to St. Matthew; the other is "a narrative of events," attributed to St. Mark and taken by him from St. Peter. This conclusion reached by the way of patient, careful criticism, singularly accords with the testimony of Papias (see Eusebius, Hist. Ecc. III.), who says: "St. Mark, having become the interpreter of St. Peter, wrote down accurately, though not indeed in order, whatsoever of the things said or done by Christ." "St. Matthew wrote the oracles (Logia) in the Hebrew language, and everyone interpreted them as he was able." Several perplexing questions, however, have arisen in regard to each source, and all of them have not as yet been satisfactorily answered.

Let us look at them in order. In regard to the "Logia," the first question is, "What was their character?" Were they simply discourses, or discourses plus some introductory narrative material? One of the best discussions of this question is to be found in Lightfoot's 'Essays on Supernal Religion' (Essay on Papias). There is now general agreement in the judgment that they include an element of narrative. Again, "How are they related to the Gospel of St. Matthew?" The answer is that they form a large part of the Gospel, and for that reason have given to it the name of Matthew, though he did not write the book as we now have it. The original Matthew (Ur-Matthæus as Weiss calls it) contained simply the Logia, with a small number of incidents. The third question is, "In which Gospel do we get the Logia in their original form, in the book of St. Matthew or in that of St. Luke?" The best answer which has yet been given to this difficult question is this: "That the balance of probability is on the side of St. Luke's Gospel," and mainly for the reason that in St. Matthew we have aggregated unities like the Sermon on the Mount, the charge to the Twelve (chap. x.), the Parables by the Sea (chap. xiii.). In regard to the other source — The Narrative of Events — the first question of importance is this: Is our Gospel of St. Mark the original Narrative of Events? The description of Papias is confirmed by Irenæus, Clemens, Alexandrinus, Tertullian, Origen, Eusebius, and Jerome, so that there is sufficient witness to the relation of Mark and Peter, and the answer which criticism has given to the above question is, "that the Petrine source used by the two later synoptists was not an Ur-Markus, but St. Mark's Gospel, almost as we have it now."

Every student of the problem knows that these two "main documents," satisfactory as they are as the principal sources of Matthew and Luke, are only the "main sources." St. Luke has gone elsewhere for parts of his Gospel, and the relation of St. Matthew to St. Luke requires the supposition of more material than the Logia gives. Oral tradition has probably had its place along with written records. The problem yet requires much patient painstaking study.

The Gospel of St. Matthew.— (*a*) *Authorship.*— Papias is the first to tell us about a form of gospel written by St. Matthew (Eusebius H. E. III: 39) and Irenæus (Adv. Hae III : 1, 1), the first to name St. Matthew as the author of the first gospel. Just in what sense these statements are facts we must see later. Meanwhile a word about St. Matthew himself. He was a tax-gatherer before his acceptance of the call of Jesus (Matt. ix. 9). Promptly responding to the invitation of the Master to follow him, he became an eye-witness of much of the Lord's ministry. There is no good reason for denying his identity with the Levi of St. Mark ii. 14, Luke v. 27. Both his position as a tax-gatherer, requiring work with the pen, and his experience as a disciple fitted him to do the work which tradition has assigned to him.

Papias and Irenæus refer to this work as in Hebrew (Aramaic), but our first gospel is in Greek, and it gives no evidence of being a translation from a Hebrew original. The question then arises, what is the relation of our Greek Matthew to the Hebrew Matthew of tradition? Criticism in seeking to answer this question has reached the following conclusions: (1) That the Gospel according to the Hebrews, in either of its forms, Ebionite or Nazarene, was not identical with the Aramaic original of St. Matthew's Gospel; nor is our Greek Matthew a translation of the Gospel to the Hebrews. (2) That the Aramaic original of which Papias and Irenæus speak, was probably the collection of discourses now known as the Logia, compiled by St. Matthew, having very little narrative material, and reflecting in character the needs and conditions amid which these Logia at first took shape (See Weizäcker, Apostolic Age, Vol. II., chap. ii.) (3) That this Aramaic source has entirely disappeared. (4) That our present Gospel of St. Matthew originated in a desire to "expand the old Apostolic source, whose form no longer met the needs of the time, into a history of the life of Jesus which would correspond to these." (5) That the framework of St. Mark's Gospel was used for the narrative setting, but because of the importance and value of the discourse element, the resultant production was called the Gospel according to St. Matthew. (6) That other narrative material such as Chapters i., ii., xxviii., were taken either from other sources or from oral tradition (Weiss). (7) That this composite Gospel existed only in Greek form and is of unknown authorship. Space forbids entering upon the evidence for each of these statements; it can be found in the literature given at the end of the article.

(*b*) *The Purpose of the Gospel.*— It aims to show that Jesus was the Messiah, not in the way John does, by making evident the glory of His person in word and deed, but through the fulfilment of Old Testament prophecy. The author seeks at each step of the history to prove by Messianic prophecies (there are over 70 quotations and references to the Old Testament) the Messiahship of Jesus. This compels him to meet the objections of the Jews and also to lay bare their motives in opposing the teaching and claims of the Master. While, therefore, the Gospel is meant to strengthen and comfort Jewish Christians, it also has, as Godet claims, an apologetic aim.

The Gospel of St. Mark.— (*a*) *Authorship.* —There has been no reason discovered for disbelieving the testimony of Papias that Mark — the John Mark of Scripture — has given us in substance the "Memoirs of Peter" regarding Jesus. Some difference of opinion exists as to the meaning of the description "interpreter"— it being understood by some as the equivalent of "amanuensis"; by others as "translator." The Gospel bears abundant witness to the character of its depictions as being those of an eye-witness. They are circumstantial, pictorial, and vivid. Papias further says that "having become the interpreter of St. Peter, St. Mark wrote down accurately, though not indeed, in order, whatsoever he remembered of the things said or done by Christ." This statement about order, whatsoever he remembered of the things events given in the Gospel, which is progressive and helpful in understanding the public career of Jesus, but to the sequences of events in detail. A topical rather than a chronological plan is followed (see Bacon's 'Introduction to the New Testament,' pp. 189–190). So good is

this order of St. Mark that both St. Matthew and St. Luke use it. Evidences of other sources besides the Petrine Memoirs are found, for example, in chapter xiii., for which the supposition of a separate written document seems needful; so too the narrative about Herod in chapter xiv. St. Mark adds some touches of his own.

(*b*) *The Purpose of the Gospel.*— The purpose of this vivid presentation of the activities of Jesus in Galilee and during the latter days in Jerusalem was not the mediating of the antagonistic tendencies in the church (Baur), nor the commendation of Paulinism (Pfleiderer), nor to counteract the effect of the delay in Christ's coming by making evident the Messianic character of the mission of Jesus (Weiss), but simply to show how "God anointed Jesus of Nazareth with the Holy Ghost and with power" and how He "went about doing good and healing all that were oppressed of the devil: for God was with him" (Acts x. 38). These are St. Peter's own words descriptive of the mission of Jesus. His Gospel gives the content of that description. Of course, the narrative was meant to be a support to faith and a means of winning men to faith.

The Gospel of St. Luke.— (*a*) *The Author.*— The Muratorian Fragment (c. 200 A.D.) is the earliest external witness to the name of St. Luke as the author of the third Gospel, "the third book of the Gospel, that according to Luke, the well-known physician." Irenæus follows with explicit testimony to the same effect, and all early tradition but seconds these witnesses. St. Luke was born, according to tradition, in Antioch, and was a Gentile. Godet's account of the strict supervision under which physicians were placed by the authorities at Rome argues an amount of culture for St. Luke quite above that of other men. St. Luke's name appears but three times in Scripture, Col. iv. 14, Philemon 24, 2 Timothy iv. 11. Of late years we have come to know him more fully as a writer, through the critical study of the Acts; and his character as a careful, philosophic historian has been ably set forth by Prof. Ramsay. (See Ramsay's 'St. Paul the Roman Traveller.') The common authorship of the Acts and the third Gospel is now generally accepted.

(*b*) *The Sources of the Gospel.*— The Introduction of the Gospel gives the author's plan of procedure and his purpose. Just what is involved in its designation of sources is difficult to say. He does not tell us whether they were oral or documentary, whether in Aramaic or Greek. The problem of the sources of St. Luke's Gospel is a complicated one, and entire unanimity has not been reached in its attempted solution. The following conclusions will give, in brief, some conception of the situation. (1) St. Mark's Gospel is one of his chief sources. Almost all of the contents of St. Mark (except vi. 45–viii. 26) are found in the third Gospel. Evidently St. Luke has used the Gospel of St. Mark as his framework, and here again criticism sees no need of postulating an Ur-Markus. It is to be noticed, however, that he omits some things recorded by St. Matthew and St. Mark, and records some things which St. Matthew and St. Mark omit. The explanations of this phenomenon have been different, but they have not invalidated the conclusion given above. (2) While St. Luke knew the Logia document in its original form, he was not familiar with our present Greek Matthew. The main reason for the latter part of this statement is discoverable in the way St. Matthew and St. Luke use the Gospel of St. Mark. "It is established," says Weiss, "as one of the indisputable results of Gospel-criticism that St. Luke's acquaintance with and use of the Apostolic source of the first Gospel is just as certain as his want of acquaintance with this Gospel itself." Where St. Matthew and St. Luke have material in common which is not found in St. Mark, another document is supposed to be the source, or oral tradition. (3) St. Luke has placed the great mass of the material which he took from the Apostolic source in the two sections which he has inserted into St. Mark's narrative, namely, in vi. 20–viii. 4, ix. 51–xviii. 14. (4) Besides these two main sources, the narrative of St. Mark and the Logia, St. Luke had other written sources, giving him the first two chapters, and the long Perean section. These may, indeed, have been parts of one source, which contained material covering the entire life of Jesus. The effect of St. Luke's hand, and the modifications of oral tradition are evident throughout the book. The uniformity of style and diction in the whole Gospel show that these varied sources were not merely put together, but were edited by St. Luke. The peculiarities of his Greek appear all through the Gospel.

(*c*) *The Purpose of the Gospel.*— It was written that Theophilus "might satisfy himself of the accuracy of the story which he had heard from others" (i. 4). Its appeal, through Theophilus, is to the Gentiles. "Luke," says Origen, "composed his Gospel for Gentile converts." In accord with this are its depiction of the humanity of Christ — the ideal man — and its broad spirit of universality.

Date and Integrity of the Synoptic Gospels.— (*a*) *Date.*— Much division of opinion exists as to the time of the writing of the Synoptic books. The materials out of which they were made originated, of course, much earlier than the gospels themselves. The time just before or just after 70 A.D. is that which now meets with much favor. Between 70–80 A.D. is the latest probable time for dating them.

(*b*) *The Integrity of the Gospels.*— Criticism has directed its attack mainly against the following parts of the Gospels: (1) Against the first two chapters of St. Matthew and St. Luke. The chief objections to these are (*a*) the wide differences in the accounts of the birth and infancy. (*b*) The character of the accounts themselves, containing angelic appearances, the visit of Magi, and the slaughter of the Innocents. (*c*) The miraculous conception. It is to be noticed that the difference in the accounts is fully explicable in the supposition that they are from different sources. St. Luke's story is undoubtedly from the Blessed Virgin Mary, and much in St. Matthew's story is traceable to Joseph. St. Luke's account in its delicacy, personages, and fidelity to the Old Testament point of view is inexplicable as a later Jewish-Christian fiction. Perhaps the angelic appearances are simply poetic descriptions of the conveyance of inward truths and facts. The story of the Magi has a rational explanation in an astrologer's interest in a planetary conjunction at a time when the widespread hope of a Messiah among the Jews would give it for these students of the heavens, a vital significance. Herod's

well-known cruelty makes easily possible the massacre at Bethlehem. For the difficulties connected with the enrollment of Quirinius, see Prof. Ramsay's 'Was Christ born in Bethlehem?' After a possible satisfactory explanation of the attendant circumstances of the supernatural birth of Jesus, there yet remains an objection to the supernatural birth itself. This must be met on philosophic grounds, for it is really a philosophic objection. These chapters of Matthew and Luke are textually as well supported as any in the Gospels, and they have early and continued attestation in the Church. The silence of the New Testament regarding the miraculous conception is no argument against it, simply because of the nature of the subject.

(2) Again criticism has given special attention to the last 12 verses of St. Mark. The generally accepted conclusion is that these verses are a later addition to the Gospel, but that they embody a genuine apostolic tradition.

(3) The accounts of the Resurrection have also been the subject of destructive criticism. Here again we must distinguish between the accounts of the Resurrection, and the Resurrection itself. It has been truthfully said that "when we come to look into the narratives of the Resurrection, we find them unassimilated and unharmonized." Is this not due to the way in which our Gospels have come to us? Where so many witnesses were involved and so many occasions cited, is it not to be expected that there should be considerable variation in the testimony? The accounts have come to us from different sources. Some of them, like the walk to Emmaus, were personal memoirs; others, like those in St. John, were selected because of their value to him personally, for the purpose he has in view. There has been no studied attempt to fit them all to each other, but they all bear clear witness to the spontaneous, unmistakable acceptance of the fact of the Resurrection. Objections which go beyond this and impugn the fact, must be met on other grounds, and it is safe to say that the various theories which have involved the denial of an actual physical resurrection of Jesus, have thus far been quite inadequate to explain the faith of the Church. This leads us to mark as the great central point of attacks upon our Gospels (4) the miraculous element in them. Here is really the battleground to-day. All sane interpreters of these records will be in sympathy with the desire to avoid an exaggeration of the miraculous. This, however, is quite a different aim from that which tries to find for every miracle of Jesus a natural though wonderful method of procedure, for example, cures of the sick through the effect of a strong personality. Both philosophy and science take issue with the statements of the Evangelists in this matter. Meanwhile the study of documents shows that even in the residuum which all critics will acknowledge genuine, the miraculous element is present, and all schools of thought are compelled to acknowledge the character of Jesus itself as a miracle. The question is not now so much one of historical evidence as it is of philosophy.

The Gospel of St. John.— From the time in 1820 when Bretschneider published in Leipsic his 'Probabilities concerning the Nature and Origin of the Gospel and Epistles of John,' modern criticism has been engaged upon the problems of the Fourth Gospel. Authorship and historicity have been the two themes about which all this criticism has centred. The best history of the course of it will be found in Watkins' Bampton lectures for 1870. The day has gone by when this Gospel can any longer be called "A Philosophic Romance" or a "Theological Novel," and even since the day when Sanday reviewed the situation in the 'Expositor' (1891–2) a distinct advance has been made toward the traditional position. Partition theories are now in order, which means that we have a Johannine nucleus of history and discourse, used by another hand (preferably that of the Presbyter John) in working up the Gospel to its present shape. (See Wendt's 'The Gospel according to St. John.' We have already called attention to the differences between this Gospel and the Synoptics. It is almost entirely in consideration of the internal evidence that "problems" have arisen, for the judgment of Matthew Arnold is valid as regards the external evidence for authorship by St. John the Apostle, that "No one who had not a theory to serve would ever dream of doubting it." In order to appreciate the serious character of these problems, it will be necessary for us to consider the purpose and plan of the Gospel.

The Purpose and Plan of the Gospel.— The purpose is given in xx. 31, "These signs have been recorded that you may believe that Jesus is the Christ, the Son of God — and that through your belief you may have life in the knowledge of him." In the "glory" (i. 14) of Jesus we are to see, his interpretation to us (i. 18) in word and deed of the Father. We are called to look at Him, behind and in His work.

At once it is evident that the author is not aiming to give us a biography, nor a complete history. It certainly is not then a contradiction of history, if he chooses his material in order to make good his purpose. That he does select his materials is beyond question. The public announcement of the Messiahship of Jesus was at the Baptism. The earlier facts of His life, therefore, have no place in this Gospel. The author begins after the Temptation, when Jesus had entered upon the way of His public ministry, and is concerned only with the events of His public life. From this time each scene is to present Him to us in some new light, that at last, in the glory of them all, we shall say with St. Thomas, "My Lord and my God." Can the Gospel with such a definite plan as this be historical? Three things must be considered in making reply: (*a*) the facts themselves, (*b*) the discourses, (*c*) the representations of Christ. How are we to adjudge facts to be facts? Manifestly, by their verisimilitude as estimated from what we know from other sources of the historical situation in which they are placed.

Take for example the first chapter or the sixth, and estimate either in this way. Personages, situation, motives, and changing temper, are all alike such as only an eye-witness could give. All through the Gospel we have such evidence of an eye-witness. As far as the facts are concerned the relation of this Gospel to the Synoptics has been set forth by no one with more helpfulness than Godet (see Introduction to his Commentary on St. John). Under the two heads of (*a*) Correlations, and (*b*) Independence, he shows how the periods containing the facts fit to each other. In some instances

St. John is more truly historical than the Synoptics as, for example, in the placing of the Cleansing of the Temple, and in the dating of the Lord's death. When we come to (*b*) the Discourses, we enter a region peculiar, indeed, to the Fourth Gospel, and one which has caused much discussion. The solution of the problem which they offer will be facilitated by bearing in mind several considerations: (1) That they are for the most part, thematic — that is, they give us only great central teachings. (2) They come to us through the medium of the author's reflection.

Westcott calls our attention to the fact "that the discourses in Jerusalem show an intimate connection with the ideas which the festivals represented, which gained their full significance as men looked back upon them from the time when they had ceased to be." It was at these times that Jesus declared the meaning of His person and office, and the great themes impressed themselves upon a mind in sympathy with such forms of presentation. But the words heard in Jerusalem were larger, richer, fuller words when written down in Ephesus many years later. They record a spiritual mind's mature conception of the Master as that mind has discovered it in memories which from the first were striking and suggestive. Have we then a subjective element in these discourses? Unquestionably. Does that subjective element imperil the truth? Not in the least. It rather gives it to us in full proportions. These discourses are not a stenographic report of the words of Jesus. They are reproductions in the clear light of the Spirit's illumination. They contain the essential, eternal verities of Jesus' teaching. Hence we expect to find them all in the style of St. John, as they are; hence we expect to find interpretation added to them here and there, as we do; hence we find them grouped at times with no clear, definite situation given to them. The solution of the problem of the discourses lies not in the denial of their historicity, but in the admission of their subjectivity. The question then presents itself, "Have we the same Christ in the Fourth Gospel as in the Synoptics?" Yes; but seen from a different point of view. The Johannine Christology never rises higher than that given in Matt. xi. 25–28; Luke x. 21–22.

Authorship.— Two characteristics appear in the writer of the Fourth Gospel. (*a*) A memory for details, and (*b*) a mature, profound conception of Jesus. They point to the work of an old man, who had been an eye-witness of what he relates. It is sufficient for the purposes of this article to say that the supposition of the authorship by John the Apostle meets more of the alleged difficulties of the Johannine problem than any other supposition. Modern criticism, however, has received with much favor the name of John the Presbyter.

Literature on the Synoptic Problem.— Gloag, 'Introduction to Synoptic Gospels' (1895); Robinson, 'The Study of the Gospels' (1902); Rushbrook, 'Synopticon' (1880); Wright, 'Synopsis of the Gospels in Greek' (1896); Hawkins, 'Horæ Synopticæ' (1899); Weiss, 'Markus-Evangelium' (1872); 'Matthäus-Evangelium' (1876); Ewald, 'Das Hauptproblem der Evangelienfrage' (1890); Wendt, 'Die Lehre Jesu' (1890); Holtzmann, 'Die Synoptischen Evangelien' (1863); 'Einleitung in das Neue Testament' (1886); Westcott, 'Introduction to the Study of the Gospels' (1895); Wright, 'Composition of the Four Gospels'; Jolley, 'The Synoptic Problem for English Readers' (1893); Sanday, 'A Survey of the Synoptic Question' (1891); 'Inspiration,' Lecture VI. (1893); Burgon, 'The Last Twelve Verses of St. Mark.'

Literature of the Johannine Problem.— Thoma, 'Die Genesis des Johan. Evan.' (1892); Ewald, 'Das Hauptproblem der Evangelienfrage' (1890); Halcombe, 'What Think Ye of the Gospels?' (1893). J. S. Riggs,
Auburn Theological Seminary.

Goss, Isham J. M., American eclectic physician and author: b. Oglethorpe County, Ga., 16 Aug. 1819; d. Marietta, Ga., 25 Feb. 1896. He graduated at Emory College, Ga., and in 1844 in medicine from the medical department of the University of Georgia. For fourteen years he followed the practice of the regular or allopathic profession, when he was converted to American Eclecticism and became a leader of that school in the South. Several Eclectic colleges conferred upon him the honorary degree of doctor of medicine. In 1868 he filled the chair of practice in the Philadelphia Medical University and in 1877 the chair of Materia Medica and Therapeutics in the Georgia Eclectic Medical College, reorganized that year. He wrote 'Materia Medica' (1877); and 'Theory and Practice of Medicine' (1882).

Goss, Charles Frederic, American Presbyterian clergyman: b. Meridian, N. Y., 14 June 1852. He was graduated from Hamilton College in 1873, from the Auburn Theological Seminary in 1876, and was at first a home missionary. In 1894 he became pastor of the Avondale Presbyterian Church of Cincinnati. He was also appointed to the chair of Biblical literature in Cincinnati University, and published several volumes, including 'The Optimist,' 'The Philopolist,' and 'The Redemption of David Corson.'

Goss, Warren Lee, American writer: b. Brewster, Mass., 19 Aug. 1838. He studied at the Harvard Law School, served in the Civil War, first in the United States engineers and later in the 2d Massachusetts volunteers; was historian of the National Union of Ex-Prisoners of War. He has been active as editor, magazine-writer, and author of such volumes as 'The Soldier's Story of Captivity at Andersonville' (1866); and 'In the Navy' (1898).

Gosse, gŏs, **Edmund William,** English literary critic and poet: b. London 21 Sept. 1849. He is a son of P. H. Gosse (q.v.). Since 1875 he has been translator to the Board of Trade. In 1884–5 he was engaged on a lecturing tour in the United States. He has made a special study of Scandinavian literature, and has published 'Studies in the Literature of Northern Europe' (1879). Other works of his are: 'Life of Gray' (1882); 'Seventeenth Century Studies: a Contribution to the History of English Poetry' (1883); 'From Shakespeare to Pope: an Inquiry into the Causes of the Rise of Classical Poetry in England' (1885); 'Life of Congreve' (1888); 'History of Eighteenth Century Literature' (1890); 'Life of Philip Henry Gosse, Naturalist' (1890); 'Gossip in a Library' (1891); 'Questions at Issue' (1893);

'The Jacobean Poets' (1894); 'Critical Kit-Kats' (1896); 'History of Modern English Literature' (1897); 'Life and Letters of Dr. Donne' (1899); 'Coventry Patmore' (1904). He has written a romance, 'The Secret of Narcisse' (1892); and several volumes of poems: 'Madrigals, Songs and Sonnets' (1870); 'On Viol and Flute' (1873); 'King Erik,' a tragedy (1876); 'The Unknown Lover,' a drama (1878); 'New Poems' (1879); 'Firdausi in Exile and Other Poems' (1886); 'In Russet and Silver' (1894); 'Collected Poems' (1896).

Gossyp'ium. See COTTON.

Gossypium Phospho, a valuable fertilizer composed of a mixture of cotton-seed meal and pulverized phosphate rock. The making of this fertilizer is an important industry in the South, where one factory has an output of 15,000 tons annually. The phosphate rock, which comes from South Carolina, passes through huge mills of great power, and is ground into a fine powder, after which it is carried through draft pipes to the top of a six-story tower, and there undergoes a process of refinement. The rich yellow meal which comes from the cotton-seed oil-mills is mixed with the ground phosphate, and adds materially to its strength as a fertilizer. The mixture thus obtained is collected into immense bins, and treated with sulphuric acid, assuming a semi-liquid state. It is then called gossypium phospho.

Gotha, Almanach de. See ALMANAC.

Go'tham, a parish of Nottinghamshire, England. The people obtained a reputation for stupidity and simplicity, and the satirical appellation of "the wise men of Gotham," owing to the tradition that King John journeyed through the town for the purpose of selecting a site for a palace, and the inhabitants not wishing to be burdened with the expenses of a royal residence, devised the plan of appearing stupid and foolish during the visit of his majesty. King John left in disgust; whereupon the Gothamites said: "More fools pass through than live in Gotham." The name Gotham is applied also to the city of New York. Thus used it appeared first in 'Salmagundi,' by Washington Irving and James K. Paulding. The authors may have had in mind the worldly wisdom of the city's inhabitants.

Gothenburg (gŏt'ĕn-boorg) **System,** a system of regulating the sale of spirituous liquors which had its origin in 1865, in Gothenburg, Sweden. A company is granted a monopoly of the sale of liquors in the town; managers at fixed salaries are placed in the public-houses, and after paying the expenses, and dividends not exceeding 6 per cent to shareholders (in Norway 5 per cent), the remainder of the profits are placed in the town treasury for the use of the general government and the agricultural society of the province. In Norway the profits, above the 5 per cent to shareholders, go to educational and charitable institutions. The system has been introduced into several towns in Sweden, Norway, and Finland. In the places where the system has been tried the number of drinking places has been lessened, the laws regarding the sale of liquors to minors and confirmed drunkards have been more rigidly observed; but the temptation to increase the revenue has in some places not promoted temperance.

Go'thia, the empire of the Visigoths, or Western Goths, which extended over Spain, and included Septimania, the territory which Theodoric held in Provence; Gaul, and the cities of Carcasonne, Narbonne, and Nimes. These he left to his son Amalarich, who, however, permitted Spain to be under the charge of the Gothic general Theudes, by whom he was eventually murdered. In the reign of Leovogild the kingdom of the Visigoths reached its climax of prosperity. He established his capital at Toledo (569–685) and encouraged art and literature. His sons Reccared and Ermengild were associated with him as co-regents. Ermengild, on becoming a convert to the Nicene faith as professed by Rome, was degraded from all dignity and imprisoned; he was promised his restoration on condition that he renounce the Catholic creed; refusing, he was put to death and was formally canonized in the 16th century by Pope Sixtus V. On the death of Leovogild, Reccared made profession of the Nicene creed, renounced Arianism, and he and his people became more closely amalgamated with the Gallic and Iberian peoples among whom they lived. In the course of the 7th century the Roman Catholic Church reached great power in the Visigothic state and ecclesiastical officials had the preponderating vote in the election of kings. Three sovereigns, Swinthila (620–631), Kindaswinth (641–649), and Wamba (672–680) tried to assert their independence, but each paid for his rashness by the loss of his throne. Witica (701–710) tried to remedy civil and ecclesiastical abuses, but the clergy opposed him, and the Gothic kingdom was already in a condition of deep decadence when the Moors arrived and defeated Roderick, his successor, on the banks of the Guadalete, August 711.

Gothic Architecture. The term Gothic implies barbarous, rude, uncivilized. It was applied by the writers of the 15th and 16th centuries, who, wishing to restore the Greco-Roman art to complete supremacy in Europe, thought to depreciate the style which it would replace. It is a most extraordinary instance of the ready adoption by the admirers of a style of a term first used contemptuously, for the term is in use in most languages in Europe. This is the style which followed the Romanesque architecture of Europe, rising out of it and being, in fact, Romanesque architecture with the addition of vaulting by means of ribs. This constructional change, introduced about 1165 in the royal domain of France, is explained under ARCHITECTURE. The improvement brought with it immense facility in vaulting internal spaces of irregular form; but inasmuch as in this way the whole thrust outward and horizontally was concentrated on a few definitely marked points, it became necessary to develop the buttress system (see BUTTRESS) and to make those masses of masonry very large and wide in the direction of the thrust. So it was that buttresses became what we see them in the choirs and apses of Gothic cathedrals — pieces of carefully built stone wall radiating from a common centre or, at least, forming a right angle with the general exterior wall of the church, their greatest dimension in the direction of the thrust coming from within.

and therefore they are much longer in-and-out than they are wide in the direction parallel to the wall. This, however, is merely the essential construction. Connected with this there arose many surprising changes. Thus the pointed arch, which had been well known in the eastern lands of the Mediterranean, which the crusaders must have seen in Egypt and Syria, and which was not unknown in the Romanesque architecture of France, became now an almost inevitable form, because these ribs of the vault could not be made to take perfectly circular curves across the open space from one point of support to another. They had to be made up of broken curves, that is, of two curves meeting one another at the apex or crown, and in this way the pointed arch would have originated had it not existed before. The Gothic style, however, adopted it as a decorative adjunct, treating all the external openings — windows, doorways and the separate members of arcades — with the pointed arch, and its decided and picturesque character soon affected the whole structure. Even where there was no vaulting, as in a dwelling house with floors of timber made of horizontal beams, window and door openings were still very commonly closed with the pointed arch.

As for the great height of the churches, that originated in the strong desire felt by the builder to get huge windows above the aisle roofs, that is to say, in the walls of the clearstory. The plan of the Gothic church being that of a high middle hall with much lower aisles, it was found that the windows in the walls of those aisles could not illuminate properly the whole interior. Moreover, it became a common practice to build chapels outside of the aisles, so that what had been windows became doorways leading from the aisles into the chapels. The clearstory windows, then, were almost the only light-giving openings, and as, in a moderate-sized church, the aisle would rise perhaps 16 feet to the spring of the vault and 28 feet to the crown or summit of the vaulting, the sloping roof of the aisle would rise at least 10 feet higher still, making a total of 38 feet to the sill of the windows which we wish to build in the clearstory. But those windows having their heads brought down to the shape of the pointed arch because they are crowded on both sides by the vault of the roof, will need to be at least 20 feet high to where their arch begins; so that in the small church which we are imagining here the height of the nave will be at least 130 feet. These would be the proportions of a Gothic church whose nave would be only 30 feet wide. But the great cathedrals had naves about 50 feet wide, and in consequence they would be from 170 to 175 feet high to the crown of the vault; and it may be repeated here that this vast height resulted in the first place from nothing more remote than the desire to get adequate space for windows. Of course in the end rivalry had something to do with it, and there is no doubt that a city starting a new cathedral had some pleasure in thinking that it would be higher and also wider than the churches of neighboring cities. The tendency to great height and to upward pointing masses is none the less a marked feature of Gothic art, and in connection with this the splendid Gothic towers must be considered, for they were always supposed to be roofed with sharply pointed spires. (See TOWER, SPIRE.)

The necessity for the great windows mentioned above was still more evident as stained and painted glass became more splendid in effect and therefore involved a diminution of the daylight which could pass. These colored windows formed one of the special glories of Gothic art, and are, indeed, the most brilliant and also the most original decorative invention of the Middle Ages. (See GLASS.) Another result of the great windows was the window tracery which supported the glass, that is to say, the invention of elaborate patterns wrought in the stone bars which divided up the immense windows. One window in Carlisle Cathedral is 27 feet wide. It is divided by vertical bars of stone into nine separate "lights," and these bars unite at the top of the window to produce an elaborately woven structure of beautiful effect.

Connected with this very surprising and unexampled system of building, the sculpture became surprisingly rich. That of the Romanesque churches had been, especially in France, very rich and varied, with splendid use of vegetable forms in leaf and flower, and a clever and picturesque employment of animal forms treated often in a very grotesque way. This was developed immensely by the Gothic stone-cutters, and by the middle of the 13th century there had taken shape a system of decorative sculpture the most admirably calculated to set off and adorn the structure itself, which the world has ever seen. In comparison with this, Greek architectural sculpture was ill adapted to its purpose as an adornment for magnificent buildings; and unequaled as were the Greek treatment of natural forms and power of design in pure sculpture, their art never undertook seriously the problem of decorating buildings. The Romans, in their sculpture of triumphal arches, set themselves more deliberately to the task of inventing an architectural sculpture, but never approached the variety, the richness and intrinsic interest of that of the 13th century.

Returning now to the structure of a Gothic church, it is to be noted that if we study the cross section of a church we shall see at once how the whole building is conceived. A very high middle hall is vaulted with stone. The vertically acting weight of that stone roof is supported on very slender stone pillars, but the thrust outward, nearly horizontal, is resisted by a strange structure called the flying buttress (q.v.). On either side of that hall is a much lower aisle, also vaulted, and the vault of this lower compartment thrusts inward against the great pillar which carries the high middle vault and also outward against the buttress built to receive it. Now what resists the inward thrust of the aisle vault? Nothing but the enormous weight of the load put upon the pier. This pier, standing between the middle hall and the aisle, would be pushed inward by the thrust of the aisle vault but for this superincumbent pressure; and the whole vertical height of that pillar somewhere from 120 to 180 feet may be relied upon to prevent that dislocation of its lower part, because all disturbing sideway thrust at the top is taken care of by the flying buttress. It is a wonderful structure for absolutely unscientific men to have worked out. It was, as can be shown, a matter of experiment. Engineering was as far as possible from being within the conception of the Gothic builders; for engineering

is the application of mathematical computation to building, and the stone-cutters of the Middle Ages had no algebra, little arithmetic and only a feeble notion of geometry. Mathematics was in its infancy in the 12th century, and we cannot suppose that any of the great builders of that time knew how to compute the thrust or the weight of his building by any calculation whatever.

The history of Gothic architecture may be briefly stated as follows: During the years from 1180 to 1300 it spread all over what is now France; over the British Isles as far as they were civilized and prosperous; over the Low Countries at the north and Spain at the south, where, indeed, French architects were much employed; over the whole Rhine country except that the magnificent round-arched cathedrals of that region caused a certain stand to be made in favor of the original Romanesque; and over the more eastern countries of Europe in so far as Christian church-building was carried on freely. Some beautiful Gothic work was done in Hungary, Bohemia, and the lands on the Baltic. Italy alone received the style from the north with reluctance. The churches built for certain convents and monasteries in the 13th century were indeed completely Gothic of the Burgundian school — buildings as faultless in style as those of the north; but great cathedrals which were wholly out of the control of the conventual orders were built in a curious mixed style which we call "Italian-Gothic" and which needs to be designated by some such compound term. The Italians, with their classical and Greco-Roman affiliation, and the natural love of the southerner for broad, unbroken surfaces and rather dark interiors, would accept neither the huge windows of the true Gothic structure nor yet the system of buttresses and flying buttresses which made the exterior so picturesque, but also so irregular and diversified. They insisted on abundant space for wall paintings, for the putting up of wall tombs and relief sculpture of various forms, and for the decoration of the external walls by mosaic, flat carving in low relief and bands of parti-colored material. In this way there grew up the astonishing cathedral churches of Siena, Orvieto, Monza, Verona, and especially of Florence, and a great number of churches of the second rank, infinitely interesting on account of their beauty of detail, each one serving almost as a museum of lovely works of art, but never satisfactory as logical and complete structures in a coherent style. The style culminated in the great church of S. Petronio, at Bologna, a vast church which was begun about 1300 with the purpose of making it by much the largest church in Italy.

The epoch from about 1400 to 1520 was the time of the flamboyant or florid Gothic. The term flamboyant is properly applied only to the French buildings which have a curious flame-like tracery. In the partial abandonment of the system of ribbed vaulting, the style had lost its main reason for being, for although this was used in many churches, it was also neglected in others, where a solid cut-stone vault was used. The decorative form retained the common influence of the pointed arch, but the sections of moulding, the form of sculpture, the main masses of the building, became very much modified and always in the direction of extreme energy and even excessive picturesqueness. Those were the days of the magnificent towers covered with elaborate pinnacles to the very top, such as Antwerp in Belgium and Strasbourg on the Rhine. Those were the days of splendid porches covered with elaborate sculpture and having very noble statuary included in their adornment. It is a splendid style and lacks only the close coherence of decoration with the structure to receive unbounded admiration. The splendid town houses in the cities in Flanders, Hainault and Brabant form the culminating points of the style in civic architecture. A variety of flamboyant Gothic exists in Spain, which is of astonishing beauty and interest. In England the Tudor style (see TUDOR ARCHITECTURE) increased in popularity through the reigns of Henry VII., Henry VIII. and Elizabeth, and was completed by the introduction of fan-vaulting, the most beautiful architectural invention of the English, and the most original invention of the 16th century.

Gothic architecture disappeared on the complete admission of the classical style imported from Italy. This took place throughout the north of Europe as early as 1520, except in England, where throughout the period which we call Elizabethan and Jacobean there were occasional attempts at building in a mediæval way, usually in connection with previously existing buildings. In England, too, the close of the reign of James I. (1625) found a completely established classical style.

From that time on nothing was done until in the nineteenth century the study given to mediæval buildings was undertaken seriously by archæologists in the single direction of artistic curiosity, and by adherents of one or another Christian church or sect because of a supposed connection between the church and the Gothic style. It was in England that the most decided movement took place. It is known as the Gothic Revival, and has been the subject of much study in illustrated volumes and in the periodicals. As early as 1845 attempts were being made to build in the Gothic way; by 1855 much more was known of the style, and such buildings as the Oxford Museum and St. George's Church at Doncaster were built. Those two buildings represent two opposite types, the church being a faithful reproduction of a bygone style, the museum a new study of that style much recast and reshaped for the new requirements. The most important modern building in the mediæval style was the Westminster Palace or Houses of Parliament. These were, by special act of Parliament, required to be "Gothic or Elizabethan" in character, and the architect, Charles Barry, afterward made a baronet, adopted the latest of all styles that could possibly be called mediæval, that is, the Tudor style. Churches, especially those of the Church of Engand, were and still are almost exclusively built in some form of Gothic; and for thirty-five years, more or less, public buildings also were frequently designed in that way, but this tendency has disappeared. For the result of this movement see ARCHITECTURE. For the use of Gothic architecture in the United States see ARCHITECTURE, AMERICAN.

Gothic Art. The art of the times and the countries in which Gothic architecture flourished. The term is a misnomer, because even if the architectural style were rightly designated "Gothic," the wall-paintings, metal work, etc., of the time are not properly so described. Still no other term exists for those arts which prevailed in Europe from 1150 to the beginning of the Risorgimento in Italy (about 1375), and in the North until the decided beginning of the Renaissance (about 1500). There are certain arts of decoration which flourished in a wonderful way during this period, while others attained little excellence. Thus the pottery of the north of Europe and even of Italy during the period named, has never attracted much interest in modern times; very few examples of it remain, and what little there is that is effective in an artistic sense is decidedly Oriental (Saracen and Moslem) in character. Glass, too, is of little interest except in connection with windows, and apparently few glass vessels were made during the Middle Ages. On the other hand, metalwork was of singular interest. Bronze was not as common as it has always been in the East and as it was to be in Europe at a later period, but wrought iron reached a splendid development in the gratings, gates, window-bars, etc., of buildings, and in the singular enclosures made for tombs. Brass was cast in large sheets and hammered smooth and then engraved with arms and legends befitting the burial slab of a knight or noble lady; silversmiths' work was carried to a high pitch of excellence, and the common use of colored enamels applied to both bronze and to silver made the ecclesiastical implements and sacred vessels of the time extremely rich. Toward the close of the Middle Ages the complete plate armor of the nobles received a splendid decoration by means of reliefs and embossings, and by gilding in patterns and etching with acid. Very beautiful stuffs were hardly ever woven in Europe during this period; for splendid weaves France, Germany, and England sought the East; but the cloths and linens of the time were good and the common use of embroidery made the costume of the wealthy very splendid. The beauty of the costume, both in color and in form, affected the sculpture of the time; for, as the nude was hardly ever represented, the drapery of the figures became the chief object, with expression of face and gesture, of the architectural sculptors of the day. Both form and color were used freely in the beautiful ivory carvings which were richly painted and gilded.

Sculpture in connection with architecture is treated above. In the semi-architectural conditions of tombs and cenotaphs, life-size statues, usually recumbent, are found as early as the 13th century. These are of marble and other stone; and it is quite well ascertained that great numbers of statues in hammered bronze richly decorated with enamels existed at one time in the churches of western Europe; these also being of life-size for the most part. The raised chest or what seems the sarcophagus, the huge stone box which gives the name of altar-tomb to these monuments, often had its sides pierced with niches, and these occupied by statuettes of religious or symbolical meaning, and often of great beauty. The carvings of decorative objects are of great variety, such as mirror backs and boxes to contain small mirrors, panels of book covers, and statuettes of sacred subjects, sometimes 15 inches or more in height, in addition to elaborate bases upon which they stand.

Painting in the highest sense of the word, that is, the representation of human life and human sentiment, was used with reserve because it had to be applied either to the walls of the church and the palace, or to the vellum pages of a manuscript book. On this account we hardly think of the paintings of the Middle Ages as having led up to that of modern times; we think rather as the origin of modern work of the painting of the 14th century Italians, who themselves derived much of their art directly from Constantinople. Still there was a great skill showing itself in those two ways, and the comparatively few remains which exist in France and Germany of the paintings on walls and vaults during the years before 1500 are worthy to be compared with the splendid miniatures in the manuscripts. These last are not always religious; some manuscripts were of history and poetry and the illustrations given to those books were in keeping with their subject. There had been a great destruction of these splendid manuscripts, but many remain in public and private collections, and modern books have been devoted to their study and to the reproduction of their finest paintings. The special achievement in the art of decoration was in the brilliant windows of the time, but for this subject see GLASS, also GOTHIC ARCHITECTURE and WINDOW.

RUSSELL STURGIS,
Author of 'Dictionary of Architecture.'

Gothic Language, the language of the Goths, a member of the Teutonic branch of the Indo-European family. It is known through a Visigothic Bible translation of the 4th century A.D. The earliest historical indications concerning the home of the Goths place them along the lower course of the Vistula in modern Poland and Prussia between Warsaw and Dan-

tzic. Here they remained as late as 150 A.D., but early in the following century, having been dislodged probably by the movements of their Hunnish neighbors, they appeared to the north of the lower Danube and on the northwestern shore of the Black Sea in modern Rumania and southwestern Russia as far east as Odessa. To the west on the Danube were the Visigoths, to the east, in southwestern Russia, the Ostrogoths. In 251 they defeated the Emperor Decius at Philippopolis, but in 270, after various incursions into Thrace and Greece, were driven back to their seat north of the Danube. They were known to the ancient historians and geographers as Gotones or Gothones, and later as Gothi, which points to the native name Gutans, or Gutos.

The only extant monuments of the language are: (1) Portions of a Bible translation, of a paraphrasing interpretation of the Gospel of John, and of a calendar contained in fragments of manuscripts written in Italy in the 6th century, presumably by Ostrogoths. (2) The signatures of Gothic witnesses on two Latin records or receipts, one at Naples, one formerly at Arezzo; the originals of which are now lost. A few Gothic words and names of alphabetic symbols in a Salzburg MS. now at Vienna. (3) A few Gothic words in a Latin epigram, a large number of proper names from Greek and Latin sources, and in old Spanish documents and inscriptions. (4) The scanty records of a Gothic language, probably Ostrogothic, preserved as late as the 16th century in the Crimea. The Bible translation, of which there remain portions of Matthew, Mark, Luke, John, Romans, 1 and 2 Corinthians, Galatians, Ephesians, Philippians, Colossians, 1 and 2 Thessalonians, 1 and 2 Timothy, Titus, Philemon, Esdras, Nehemiah, is associated always with the name Ulfilar or Ulfilas. He was probably himself a Goth, born about 310 A.D., made bishop of the Goths 341, removed 348, with a large body of his followers avoiding persecution, into Mœsia, south of the Danube; died 380 or 381, Ulfilas not only did the work of translation, probably of the entire Bible, but he invented an alphabet for it, using as a basis the Greek uncial alphabet of his time with preservation of its order, as well as of the numerical and phonetic values of the letters. He adapted it, however, to its purpose by the use of forms taken from the Latin and Runic alphabets, creating a system better for the purpose than either of the three.

The inflexion of nouns is distinguished by its relatively close approach to the original Indo-European system. Of the cases it preserves nominative, vocative, genitive, accusative, and dative, the latter including the original instrumental and locative, and to some extent the ablative.

In the remarks that follow we shall take the German and Latin as the bases of comparison. The Gothic article is as follows: *sa*, der; *so*, die; *thata*, das; gen. *this*, des; *thizos*, der; dat. *thamma*, dem; *thizai*, der; accus. *thana*, den; *tho*, die; *thata*, das; pl. masc. *thai*, fem. *thos*, neuter *tho*, die; gen. *thize*, der; dat. *thaim*, den; accus. *thans, thos, tho*, die. There are four cases, nominative, genitive, dative, and accusative; the ablative is only the dative with prepositions. The declensions are as follows: *a*. Strong: *fisks* (Lat. *piscis*, Germ. *Fisch*, fish), *fiskis, fiska, fisk;* pl. *fiskos, fiske, fiskam, fiskans*. *b*. Weak: *hairt-o* (Lat. *cor, cord-is*, Germ. *Herz*, heart), *-ins, -in, -o;* pl. *hairt-ona, -ane, -am, -ona*. Examples of promiscuous cases: *galaubein-as* (Germ. *Glauben-s*); *ahm-an* (Lat. *animum*, Germ. *Athem*); *hand-au* (dat. *Hand*), *-uns* (*Hände*), *-um* (*Händen*); *manag-eim* (dat. pl. *Mengen*); *vastjōs* (Lat. accus. pl. *vestes*); *sunus* (son), *-aus* (Germ. *Sohn-es*), *-au* (*Sohn-e*), pl. *-jus* (*Söhn-e*), etc.—Adjective: *gamain-s* (Germ. *gemein-er*, Lat. *communis*), fem. and neuter, *-a*; comparative degree: masc. *-za*, fem. *-zie*, neuter *-zo;* superlative: *-sts, -sta, -st*. Irregular: *gōda* (good), *batizo* (better), *batists* (best); *ubils, vairsiza* (evil, worse); *mikels, maizo, maizists* (Lat. *magnus, major, maximus*); *leitil, minniza, minnists* (*parvus* [little], *minor, minimus*). The numerals are: 1, *ains, aina, ain;* 2, *tvai, tvos, tva;* 3, *thrins;* 4, *fidvor, fidur;* 5, *fimf;* 6, *saihs;* 7, *sibun;* 8, *ahtau;* 9, *niun;* 10, *taihun, -tig;* 12, *tvalib, tvalif;* 20, *tvaimtig;* 30, *thrinstiguns*, etc.; 80, *ahtautehund;* 100, *hund;* 200, *tvahunda*, etc.; 1,000, *thusund*. Some of the pronouns are: *Ik, thu, is* (fem. *si*, neuter *ita;* Lat. *is, ea, id*); *meina, theina, izes* (*mei, tui, ejus*); *mis, thus, imma* (*mihi, tibi, ei*); *mik, thuk, ina* (Germ. *mich, dich, ihm*); dual. *vit, git* (we two, ye two); gen. *ugkis, igcvis* (of us two, etc.), etc.; *iains, silba, unsar, hveleiks, hvas*, etc. (Germ. *jener, selber, unser, welcher, was*). Examples of verbs: *visan* (Germ. *Wesen*, Lat. *esse*); *im, is, ist, siium, siith, sind*, (*sum, es, est; sumus, estis, sunt*); *vas, vast, vas, vesum, vesuth, vesum* (*fui, fuisti*, etc., Eng. was; future: *siiau, siiis, siiai*, etc.; *vairthan* (Germ. *werden*), *sōkian* (Lat. *sequi*, Germ. *suchen*) etc. The following verb is compared with Sanscrit and Latin: *bair-a* (Sans. *bhārā-mi*, Lat. *fer-o*),*-is* (*-si, -s*), *-ith* (*-ti, -t*); dual. *bair-aus* (Sans. *-ias*), *-ats* (*bhārā-tas*); it has no 3d person (Sans. *bhārē-tam*); pl. *bair-am* (Sans. *bhārā-vas*, Lat. *fer-i-mus*), *-ith* (*bhārā-tha, -tis*), *-und* (*-orti, -unt*); passive or middle: *bair-ada* (Sans. *bhār-ē*, Lat. *fer-or*), *-aza* (*-asē, -eris*), *-ada* (*-atē, -tur*), etc. The following are some of the adverbs, prepositions, and conjunctions: *aiv*, ever; *thar*, there; *her*, here; *iup*, upward; *uta*, outward; *af*, of; *at*, to; *fram*, from, of, for, since; *gau*, if; *inthammei*, whereas, Germ. *indem* (in that), etc.

Gothic Literature, the literature of the Goths, represented chiefly in the version of the Scriptures by Ulfilas, born in Cappadocia about 318, whence he was taken, together with his family, by the Goths, into Mœsia, became their second bishop about 348, and is considered as the translator of almost the whole Bible into Gothic (between 360 and 379). The *Codex Argenteus* (rather *Aureus et Argenteus*), containing a portion of the Gospels, translated by Ulfilas, with capitals of gold foil and the other letters of silver foil, deeply impressed into very fine vellum of a violet color, was made for the use of a Gothic king. It was a part of the plunder taken either by Clovis (507) from Toulouse, after the defeat of Alaric II., or by Childebert from King Amalaric (531). Anton Morillon, secretary to Cardinal Granvelle, found it in the monastery of Werden, near Cologne. Thence it was sent to Prague, and thence to Stockholm by Count Königsmark, after the storming of that city. Vossius, on visiting

Queen Christina, became its possessor (1655), and carried it to Holland, where it was purchased by Pufendorf (1662) for Count M. G. de la Gardie, chancellor of Sweden, who presented it to the University of Upsala (1669), having enclosed it in a silver case. It contained originally 640 pages, only 326 of which were legible in 1670, and a dozen leaves were purloined even of this remnant. Erik Benzel produced a splendid edition of it, and it was subsequently republished by Fr. Junius (Dort 1665), Georg Stiernhielm, from an exact transcript of the original by Derrer, which was burned at Upsala in 1702 (Stockholm 1671), and Edward Lye, from Benzel's edition (Oxford 1750). Johan Ihre, assisted by Sotberg, published a treatise on it, 'Ulphilas Illustratus' (Upsala 1752–5), and 'Fragmenta Versionis Ulphilanæ' (1763), which were reprinted by Dr. A. F. Büsching under the title 'Scripta Versionem Ulphilanam et Linguam Mœso-Gothcam illustrantia' (Berlin 1773). The version of the Bible was probably continued by others after Ulfilas, and the contents of the silver codex itself were revised in Latin versions. Fr. Ant. Knittel found at Wolfenbüttel (1756) a palimpsest with Gothic fragments of the epistle of Paul to the Romans (*Codex Carolinus*). Angelo Mai and Carlo Castiglione discovered at Milan five palimpsests, containing parts of Matthew, the epistles of Paul almost complete, some fragments of Ezra and Nehemiah, of a Gothic calendar, and of a homily. Castiglione edited the fragments of the epistles of St. Paul (1829–39). The epistles to the Hebrews and the Corinthians, the Apocalypse, and the Acts of the Apostles are wanting; but it is not known whether they were ever transalted into Gothic. Gothic signatures of names on documents were found at Naples (in the inscriptions of Donis), of which facsimiles were published by Sierakowsky and Massmann (fol., Vienna 1838). But the 'Gothicon' of Constantine Porphyrogenitus (lays sung at court by circus riders dressed in the garb of Goths, accompanied by the pandura, a sort of lyre), and the inscription on a yard-stick, are not genuine Gothic.

Goths, an ancient Teutonic tribe, whose earliest known home was the shores of the Baltic, between the Vistula and the Oder, where they were living in the 1st century after Christ. Thence they migrated in the 3d century to the regions adjoining the Black Sea. Many other tribes were incorporated with them, and by continual advances and conquests they established, under Ermenric (about 350), the great Gothic kingdom, extending from the Black Sea to the Gulf of Bothnia. This naturally brought the Goths into continual contact, on the west with the western Roman empire, and on the east with the eastern empire as centred at Constantinople. About the year 369 internal commotions produced the division of the great Gothic kingdom into the kingdom of the Ostrogoths (eastern Goths), on the shores of the Black Sea, from the Don to the Dnieper, and the kingdom of the Visigoths (western Goths), from the Dnieper to the Danube. About the year 375 vast multitudes of the Huns and of the Alans, which latter had been subdued by the Huns, poured out of Asia, and drove back the Ostrogoths upon the Visigoths. The Goths obtained permission from the Emperor Valens to settle in Thrace, but were driven to rebellion by the oppression of the imperial governor. In the war which ensued Valens himself was defeated and slain by them at Adrianople in 378. The Emperor Theodosius incorporated the Gothic army into his legions, and henceforth they had an important influence in the affairs of Constantinople. After many vicissitudes the Ostrogoths obtained a settlement in Pannonia and Slavonia, but not till the destruction of the kingdom of the Huns in 453. The Visigoths in process of time obtained a degree of power which excited alarm in Greece and Italy. In 369 Alaric made an irruption into Greece, laid waste the Peloponnesus, and became prefect of Illyria and king of the Visigoths. He invaded Italy about the beginning of the 5th century, and by that measure brought on the destruction of the Roman empire, since Stilicho, the Roman general, could only obtain a victory over Alaric at Verona (in 403) by withdrawing all the Roman troops from the borders of the Rhine. Alaric himself soon returned to Italy, and sacked Rome in 409, and a second time in 410. In 552 the Goths in Italy were finally overthrown in battle and expelled from the peninsula by Narses, general of Justinian. The Visigoths succeeded in establishing a new kingdom in the southern parts of Gaul and Spain, of which, toward the end of the 5th century, Provence, Languedoc, and Catalonia were the principal provinces, and Toulouse the seat of government. The last king, Roderick, died in 711 in battle against the Moors. Since the time of Constantine, Christianity appears to have taken root among the Goths, whence a Gothic bishop is mentioned as present at the Council of Nicæa, 325 A.D. Their form of Christianity was Arian, like that of their protector Valens, and their bishop Ulfilas. The introduction of Christianity among these Goths, and the circumstance of their dwelling near and even among civilized subjects of the Roman empire, greatly contributed to raising them in civilization above the other German tribes. See GOTHIC LANGUAGE; GOTHIC LITERATURE; GOTHIA; OSTROGOTHS; SEPTIMANIA; ULFILAS; VISIGOTHS.

Gottenburg, gŏt'tĕn-boorg, **Gothenburg,** or **Göteborg** (Swedish *Göteborg,* or *Götheborg;* Latin, *Gothoburgum*), Sweden, seaport, the second in the kingdom in respect to population and trade, capital of the county of the same name; situated on the Gota, five miles from its mouth, 255 miles west-southwest of Stockholm. It has a dry dock cut out of the solid rock; and the completion of the Gota canal, and also the railway facilities have greatly increased its commercial importance. Although founded in 1618, by Gustavus Adolphus, the town, in consequence of numerous fires, is quite modern,— the streets are at right angles and the houses well built. The manufactures include iron, steel, machinery, sail-cloth, linen, and leather, and there are oil-presses, cotton-mills, dye-works, and building-yards, at which a considerable number of vessels are launched; the most important industrial establishments are tobacco factories, porter breweries, and sugar-refineries. The trade is very extensive, the harbor being excellent and generally free from ice. Its commercial importance dates from the Continental blockade

of 1806, when it became the chief British depot in northern Europe. The chief exports are iron and steel, copper, wood, tar, linseed, bark, bones, juniper berries, cranberries, and manufactured articles; the chief imports grain, sugar, coffee, tea, wine, salt, seal-oil, cotton yarn, and twist. Among social reforms the town is noted for its licensing system (see GOTHENBURG SYSTEM). Pop. (1897) 117,103.

Götterdämmerung, gėt″tėr-dĕm′mĕ-roong, "the twilight, or gathering nightfall of the gods," the title of Wagner's closing opera in his Nibelungen cycle of dramas. The subject of the opera is what is called in Scandinavian mythology the *Ragnarok*, or end of the world. This was brought about largely by the admission of Loke, the god of evil and mischief, into Asgard, the abode of the gods. It was through Loke that Balder, the bright and good god, was slain and flung down into the abodes of Hel, the goddess of death. Confusion throughout the universe is the consequence. The sun and moon are swallowed by giants; continuous winters rage without an intervening summer; the earth trembles in the throes of earthquakes. Mountains topple down with a crash; the Fenriswolf breaks its chains and fetters. The Midgard serpent writhes to get free; the ship Naglfar, built of the finger-nails of dead men, passes over the sea, filled with giants of the frost and mountain; Loke leads the hosts of Hel and bursts upon the scene. The powers of evil rush to the battlefield Vigrid, while Heimdal blows his Gjallarhorn, Odin seeks the giants for advice, the other gods as well as the heroes of Valhal arm themselves and sally forth, and the battle begins. While the fight is still raging the immortal god Surt flings light and flame over the world, and the earth, reduced to ashes, sinks beneath the watery waste. See NIBELUNGENLIED; RAGAROK; and SCANDINAVIAN MYTHOLOGY.

Gottfried (gŏt′frēd) **of Strasburg**, German poet: probably b. Strasburg about 1200. He was not, like most of the Minnesingers (minstrels) of his age, a noble. Besides many lays, he was the author of the great chivalric poem, 'Tristan und Isolde,' derived from a Welsh original, but possessing as much originality of character as any other German classical work. For grace, elegance, and vivacity of description, richness of coloring, and melody of versification, this work stands alone in old German literature.

Gottheil, gŏt′hīl, **Gustav**, American rabbi: b. Pinne, Posen, 28 May 1827; d. New York 15 April 1903. Following in his boyhood the studies prescribed for Jewish youth, he was fortunate in broadening his education at the universities of Berlin and Bonn. In 1855 he was elected assistant rabbi at the Berlin Reform Temple, thus early showing his progressive tendencies. In 1861 he received a call to the Congregation of British Jews, Manchester, England, where he spent 13 years of effective work. In 1873 he was invited to the Temple Emanu El, of New York, first as assistant to Rev. Dr. Samuel Adler, and then, on the latter's retirement, as sole rabbi. In his new field his activity rapidly developed along the lines of education and benevolence. Under his personal impetus the Emanu El Preparatory School and the Jewish Ministers' Association were founded, and continued for some years. He organized the Emanu El Sisterhood of Personal Service, which, adopted by many other Congregations, has become a successful feature of communal benevolence. His voice and pen were largely enlisted in behalf of Judaism and the liberal movement, and he was often heard in Christian churches, while Christian clergymen occasionally occupied his pulpit. A favorite speaker at public gatherings, his enthusiasm, sympathy, and broad culture did much to win recognition for his co-religionists. In his last years he was an ardent champion of Dr. Herzel's movement to secure a place of shelter for persecuted Jews, the latest development of the Zionistic idea. Apart from contributions to a few magazines and reviews, his published works were a hymn book and 'Sun and Shield,' a book of daily devotion, in both of which he drew largely from non-Jewish sources.

Gottheil, Richard James Horatio, American Semitic scholar: b. Manchester, England, 13 Oct. 1862. He was graduated from Columbia in 1881, studied also at Berlin, Tübingen, and Leipsic, and became professor of Semitic languages in Columbia, director of the Oriental section of the New York public library, and (1898) president of the American Federation of Zionists, of whose principles he is an active exponent. He is also a member of the central committee of the general organization. He became an editor of the 'Jewish Encyclopædia' in 1901, and published 'The Syriac Grammar of Mar Elia of Zobha' (1887). He is a son of G. Gottheil (q.v.).

Göttingen, gėt′tĭng-ĕn, Germany, town in the Prussian province of Hanover, in the valley of the Leine, 59 miles south-southeast of Hanover. It is a place of great antiquity, and was once famous for its fortifications. It contains a noted university, founded in 1734. Göttingen belonged to the Hanseatic League and enjoyed great prosperity until the Thirty Years' War. The manufactures consist chiefly of a few woolen tissues, tobacco, leather, paper, books, and philosophical instruments. Pop. 30,293.

Göttingen, University of, or **Georg-August University**, a German institution, was founded by George II. of England, known also as Georg August, elector of Hanover. The plan of the school was outlined as early as 1732, was established in 1734, and opened in 1737. Its popularity decreased after the expulsion of the seven professors: Albrecht, Dahlmann, Ewald, Gervinus, the two Grimms, and Weber, for political reasons, but it has recovered itself since 1866, and in 1901–2–3 it had an average attendance of over 1,000 students, and several eminent names among its professors. The principal building, to which William IV. of England contributed £3,000, was completed in 1837. Connected with the university are a museum with extensive and valuable collections, an observatory, a well-equipped school of anatomy, botanical gardens, and a library of about 500,000 printed volumes and nearly 6,000 manuscripts. It has also a pedagogical seminary, a gymnasium which dates from the 16th century, a museum, an art gallery of German and Flemish pictures. Consult: Pütter, Saalfield.

and Oesterley, 'Die Georg-August Universitat.'

Gottschalk, gŏt'shälk, **Louis Moreau,** American pianist and composer: b. New Orleans, La., 8 May 1829; d. Rio de Janeiro, Brazil, 18 Dec. 1869. He studied in Paris and after his return to the United States in 1853 became the most popular pianist in America. His playing was confined to his own compositions. He traveled extensively in Mexico, the West Indies, and South America, and was taken fatally ill, while playing at Rio Janeiro his latest work, 'La Morte.'

Götz von Berlichingen. See BERLICHINGEN, GÖTZ VON.

Gough, gŏf, **John Bartholomew,** American temperance lecturer: b. Sandgate, Kent, England, 22 Aug. 1817; d. Frankford, Pa., 18 Feb. 1886. He came to America in 1829 and two years later became a bookbinder in New York. Falling into dissipation, he lost regular employment and was reduced to giving recitations and singing comic songs at low grog shops. In 1842 he was induced to attend a temperance meeting and take the pledge; and he then made up his mind not only to reform, but to influence others to do likewise. Save for a short relapse, a few months later, his pledge was kept, and ere long, as a temperance lecturer, he became one of the most popular of public speakers in America and England, which he visited on temperance tours 1853–5, 1857–60, and 1878. In later life he handled literary and social topics, as well as temperance themes in his lectures. He published an 'Autobiography' (1846; enlarged 1870); 'Orations' (1854); 'Temperance Lectures' (1879); 'Sunlight and Shadow, or Gleanings from My Life Work' (1880).

Goujon, Jean, zhŏñ goo-zhôñ, French sculptor and architect: b. Paris 1515; d. about 1570. He was employed with Pierre Lescot, architect of the Louvre, on the restorations of St. Germain l'Auxerrois, 1542–4; and after the accession of Henry II., decorated the Chateau d' Anet for the king and Diana of Poitiers. To him is ascribed what is considered the masterpiece of French sculpture, the 'Huntress Diana,' now in the Louvre collection, and the fountain of the Innocents at Paris was also his work.

Gould, goold, **Augustus Addison,** American zoologist: b. New Ipswich, N. H., 23 April 1805; d. Boston 15 Dec. 1866. He was graduated at Harvard 1825, and in 1856 became visiting physician to the Massachusetts General Hospital. His strong scientific tastes led him to take up investigations in botany, zoology, and conchology, and in the latter branch he became one of the most eminent authorities in the whole world. He published 'System of Natural History' (1833); 'Invertebrate Animals of Massachusetts' (1841); 'Otia Conchologica' (1863); 'Principles of Zoology' with Agassiz (1848).

Gould, Benjamin Apthorp, American astronomer: b. Boston, Mass., 27 Sept. 1824; d. Cambridge, Mass., 26 Nov. 1896. He was graduated at Harvard in 1844 and pursued the scientific study of astronomy at several foreign observatories, returning to America in 1848. In 1851 he assumed charge of the longitude department of the United States Coast Survey, and perfected methods for determining the longitudes telegraphically. By 1866, 20 longitudes in the United States had thus been determined. He was director of the national observatory at Cordova, Argentina, 1870–85, and there completed three extensive star catalogues, and conducted meteorological and climatological investigations. He was the founder and editor of the 'Astronomical Journal' (1849–61), and published 'On the Trans-Atlantic Longitude, as Determined by the Coast Survey' (1869); 'Uranometria Argentina' (1879); etc.

Gould, Elgin Ralston Lovell, American economist: b. Oshawa, Ontario, Canada, 15 Aug. 1860. He was graduated from Victoria University, was fellow (1882–4) and lecturer (1892–7) at the Johns Hopkins University, and professor in the University of Chicago (1895–6). In 1896 he became president of the City and Suburban Homes Company of New York, and at one time vice-president of the American Economic Association. He has written: 'The Housing of Working People'; 'Popular Control of the Liquor Traffic'; 'The Gothenburg System of Liquor Traffic'; 'The Social Condition of Labor.'

Gould, George Jay, American capitalist: b. New York 1858. He was the eldest son of Jay Gould (q.v.). In financial circles he was active chiefly in connection with his large railway interests, particularly as president, from 1888, of the Little Rock & Fort Smith Railroad, from 1892 of the Manhattan Elevated Railroad of New York, and from 1893 of the Saint Louis, Iron Mountain & Southern; the International & Great Northern; and the Missouri Pacific.

Gould, Hannah Flagg, American poet: b. Lancaster, Mass., 1789; d. Newburyport, Mass., 5 Sept. 1865. She was an aunt of B. A. Gould (q.v.), and at one time very popular as a verse writer. She published: 'Hymns and Poems for Children' (1854); 'The Golden Vase'; 'The Youth's Coronal' (1850); 'The Mother's Dream' (1853); etc. 'The Snow-Flake' and 'The Frost' are still remembered and quoted among her poems.

Gould, Helen Miller, American philanthropist: b. New York 20 June 1868. She is a daughter of Jay Gould (q.v.), and has achieved an extended fame through her benefactions for charitable and educational uses. At the opening of the war with Spain she not only contributed $100,000 to the United States government, but was active in the Woman's National War Relief Association, to which she was a generous contributor. Among other notable gifts of hers are that of $380,000 to New York University, etc., in 1898; $50,000 to the naval branch of the Young Men's Christian Association of Brooklyn; and $100,000 to New York University for a Hall of Fame for Great Americans, in 1900.

Gould, Jay, American financier: b. Roxbury, N. Y., 27 May 1836; d. New York 2 Dec. 1892. He was brought up to labor on his father's farm; and was for a short time a student at Hobart College. Here he learned surveying. After making surveys of Ulster, Albany and Delaware counties, he began his railroad career. This was directly after the panic of 1857. His first speculation was the purchase of

the bonds of the Rutland & Washington Railroad. He himself became president, treasurer, and superintendent of the road. Soon afterward he effected a consolidation of his road with the Rensselaer & Saratoga line, withdrew his capital, removed to New York, opened a broker's office, and began dealing in Erie stocks and bonds. His aim was to gain control of the Erie. This he did by depressing the value of the stock and then buying it in. In association with James Fisk, Jr., he entered the directory of the company, was elected president, while Fisk became vice-president and treasurer. On the reorganization of the company, 1872, he lost official connection with it. He then invested in the Pacific railroads, secured control of several lines, built branches, and effected combinations which resulted in the establishment of what is known as the "Gould system." Jay Gould and his partner, Fisk, were the cause of the financial crisis and panic known as "Black Friday" (q.v.). They cornered all the gold in New York, $15,000,000, and caused numerous failures, netting themselves $11,000,000.

Gould, John, English naturalist: b. Lyme, Dorsetshire, 14 Sept. 1804; d. London 3 Feb. 1881. His reputation as a taxidermist procured him the post of curator to the Museum of the Royal Zoological Society in 1827, and in 1832 he published 'A Century of Birds from the Himalayan Mountains.' He next undertook a work of much more extensive character, entitled the 'Birds of Europe,' published 1832–7. This was followed by: 'Birds of Australia' 1842–8; 'Mammals of Australia' (1859); 'Monograph of the Trochilidæ, or Family of Humming Birds' (1850); 'Monograph of the Odontophorinæ, or Partridges of America'; etc.

Gould, Sabine Baring. See BARING GOULD, SABINE.

Gould, Thomas R., American sculptor: b. Boston 1818; d. 1881. He was a pupil of Seth Cheney, of Boston, and there established his first studio. From 1868 he was in Florence, Italy. His works include a statue of Hancock in the Lexington town-hall; portrait-busts of Junius Brutus Booth, Emerson, and Gov. John A. Andrew; and the ideal statues 'The West Wind,' 'Christ,' and 'Satan.'

Gounod, Charles François, shärl frän-swä goo-nō, French composer: b. Paris 17 June 1818; d. St. Cloud 18 Oct. 1893. He began his studies in the Paris Conservatory under Halévy, Le Sueur, and Paer, and carried the Rome prize with his cantata 'Fernando' in 1849. While in Rome he made Italian Church music his chief study. His mass in the style of Palestrina, which he composed in Vienna in 1843 after his return from Rome, was the first fruits of this study. On arriving at Paris he took charge of the music in the church of the Missions Etrangères, and produced no original work until April 1851, when his first opera, 'Sappho,' appeared. Gounod's next production was the five-act opera, 'The Bleeding Nun ('La Nonne sanglante') (1854). Following this was the comic opera founded on Molière's 'Le Médecin malgré lui' (1858), and the grand opera 'Faust et Marguerite,' which latter was a signal success and was produced with much enthusiasm in all the more important opera houses of Europe. Even in Germany, the home of the Faust legend in music and poetry, the originality, and wealth of melody of Gounod's music, together with his powerful orchestration were so manifest above all else in the opera, that his Faust became a favorite with the public. Later operas of his were: 'Philémon et Baucis' (1860), which was not popular; 'La Reine de Saba' (1862); 'Mireille' (1864); 'Roméo et Juliette' (1867), which was favorably received in every opera house of Germany; 'Polyeucte' (after Corneille's drama), which was a failure; finally the comic opera, 'Cinq Mars' (1877), and the last of his grand operas, 'Le Tribut of Zamora,' which was well received. Besides these operatic compositions he wrote much religious music, notably the 'Rédemption,' which was performed in England and later in Germany, and has been very popular in the United States. He also produced at Brussels his 'Mors et Vita,' and in addition wrote cantatas, symphonies, pieces for the piano and numerous songs. During the Franco-Prussian war (1870–1) he resided in England, where he formed the Gounod Choir, a chorus of mixed voices, whose concerts were widely popular. Consult: Claretie, 'Portraits Contemporains' (1875); Voss, 'Ein Lebensbild' (1895); Paguerre, 'Charles Gounod, sa vie et ses œuvres' (1890); Boret, 'Charles Gounod, His Life and His Works' (1890).

Goupil, Jules Adolphe, zhül ä-dōlf goo-pēl, French painter: b. Paris 7 May 1839; d. Neuilly 30 April 1883. He was a pupil in the studio of Ary Scheffer and achieved success by his powers as a portrait and genre painter. His most famous picture, 'Mme. Roland's Last Day in Prison,' is in the Luxembourg. His father, Adolph Goupil, did much to encourage the introduction of French art into this country; well known throughout Europe as a Parisian picture dealer, he opened a branch house in New York.

Goura, gow'rạ, any one of a group of large, handsomely dressed pigeons of New Guinea, constituting the genus *Goura,* and distinguished by their fan-like crests, — the crowned pigeons. These birds are found near open or cultivated lands, ranging near the ground in small flocks, and feeding on buds, seeds, berries, and other fruits, and on worms, snails, and insects. In addition to the cooing heard in the nuptial season, they utter harsh, trumpet-like cries. During the heat of the day, or when alarmed, they hide in the thickest jungle. They make rude nests and lay only one white egg. The best-known species (*G. coronatus*) is a beautiful bird over two feet in total length. It is sometimes kept among poultry, and its flesh is much esteemed.

Gourami, goo'rạ-mĭ. See GORAMY.

Gourd, gōrd or goord, a plant of the genus *Cucurbita* or its fruit. In Europe the name is given generally to pumpkins, squashes, melons, etc.; but in America is restricted to those with hard-skinned, thin-fleshed inedible fruits, cultivated for ornament or because their excavated shells are useful as dippers, etc. See CALABASH GOURD; CUCURBITACEÆ.

The Hebrew word translated gourd in Scripture is apparently so much akin to the Greek word *kiki,* used by Dioscorides for the castor-

oil plant (*Ricinus communis*), that the "gourd" of Scripture was probably that species. It is a euphorbiaceous plant. The wild gourd of Scripture is a plant which grew on a wild vine — that is, was procumbent, and had tendrils. It moreover produced "death in the pot"; discoverable in a moment by the taste. It was probably either the colocynth (*Citrullus colocynthis*), or the squirting cucumber (*Momordica elaterium*).

Gourd-seed. A fish. See BLACKHORSE.

Gourd-worm, the fluke-worm (q.v.) which affects the livers of sheep.

Gourgand, Gaspard, BARON DE, French general: b. Versailles 14 Sept. 1783; d. 25 July 1852. Entering the army as lieutenant of artillery in 1802, he distinguished himself in several important battles, and in the battle of Brienne saved Napoleon's life from the Cossacks. He subsequently became Napoleon's adjutant, and as his confidential secretary accompanied him to St. Helena, but for various political reasons left him in 1818. He was subsequently aid-de-camp to Louis Philippe, and became a member of the House of Peers in 1841. In the previous year he was made one of the commission appointed to bring the remains of Napoleon from St. Helena to France. He was passionately devoted to Napoleon and unreasonably jealous of those who attended upon the emperor in his exile. He assisted Napoleon in writing his 'Mèmoires' and was the author of 'La campagne de 1815'; 'Mèmoires pour servir a l'histoire de France sous Napoleon' (1822–3); 'Réputation de la vie de Napoleon par Sir Walter Scott' (1827); and a remarkable journal kept during his stay at St. Helena, but which remained in MSS. till 1898. An English translation of selections from the journal by Mrs. Elizabeth Latimer (q.v.) appeared in 1903. The work is exceedingly prolix, but of great value, since it records with the minuteness of Pepys, or the precision of Boswell, the incidents of daily life and the conversations of the fallen emperor. In no other work can the personal side of Napoleon be so well studied as in Gourgaud's journal. An entire chapter is given to the emperor's criticisms on his own action at Waterloo, and of equal interest are his judgments concerning other great commanders from Cæsar's times to his own. His opinions regarding English character are essentially French in their character, and amusing from their entire misconception of it. But in this journal we are shown Napoleon's conversation on almost every conceivable subject, insignificant or important, and always with the frankest egotism.

Gourgues, Dominique de, dō-mē-nēk dė goorg, French soldier and adventurer: b. Mont-de-Marsan 1530; d. 1593. Captured by the Spaniards in Italy, where he was serving in the army of Maréchal de Strozzi (1557), he was condemned to the galleys and in 1559 his ship was taken by the Turks; the Turkish ship in turn fell into the hands of the Knights of Malta, who set him at liberty. After many voyages to Africa and South America he signalized his name by taking vengeance on the Spaniards of Fort San Mateo, who under Menendez had massacred the Huguenots of Fort Caroline, Florida. He razed Fort Mateo and killed in battle or hanged every Spaniard he found there.

Gourney, SIR **Goldworthy,** English inventor: b. Treator, England, 14 Feb. 1793; d. Reeds, England, 28 Feb. 1875. His early studies were in medicine, but he subsequently devoted himself to chemistry. Among important inventions by him are the oxyhydrogen blowpipe, lime-magnesium and oil-gas lights, the high-pressure steam jet, the tubular boiler, and steam carriage. He was knighted in 1863.

Gout, a disease of comparative infrequency, affecting for the most part the large joints of the foot or knee, and accompanied by a deposition in the joints of a salt of uric acid, notably sodium urate. It is a disease that has been observed for many centuries, and many of the older classical writers have left descriptions, jibes, and witticisms concerning it. Notwithstanding an immense amount of study of the many factors concerned with gout it remains true that the real essential causes of the disease are unknown. Gout is found throughout civilized communities, but it is no respecter of persons, alike affecting the rich and the poor, although it is more prevalent among the former. Whether the afflicted are the "fag-ends" of previously well-to-do families is unknown. Gout is thought to be much more common in England and in Germany than it is in the United States, and the few statistics available, while notoriously unreliable, seem to bear out this belief. Some observers believe that the disease is becoming more frequent in the United States. On this point, however, there are almost no reliable figures. It is a disease of middle years, and men are more often attacked than women.

The symptoms of gout may be grouped under three general heads, acute gout, chronic gout, and irregular gout. In acute gout there may be premonitory twinges of pain in the small joints of the hand or foot. These may be accompanied by dyspepsia, restlessness, and irritability. The urine is usually diminished in amount, is dark in color, and strong in odor. On cooling, a greater deposit of brick-dust urates occurs than is usual. This brick-dust sediment, it should be borne in mind, occurs in practically all healthy urine when cooled. It is not a sign of disease, and quacks would starve if the people did not believe their "brick-dust" horrors. The gout attack frequently commences in the middle of the night, or about 4 A.M., when the temperature of the body is nearly at its lowest point. There is excruciating pain in some one of the joints of the body, usually of the big toe. The pain is accompanied by swelling, redness, and stiffness of the joint, and there may be some constitutional disturbance with a rise of temperature to 102° and 103° F. The symptoms may slowly subside during the day, to recur with equal or diminished severity at a 24-hour interval. After 3, 4, or 6 days the swelling and pain gradually grow less, and in 8 or 10 days the patient may be well. Other joints may be involved, and the attack may last only a few days or may persist for two weeks or more. Occasionally there are accompanying gastro-intestinal disturbances, with nausea, vomiting, diarrhœa, dyspnœa, and heart-depression. If an acute attack is followed by other attacks, a condition of chronic gout develops. The joints become sore and remain swollen, and a larger number of joints become involved in the reaction. The joints no longer lose their swollen

appearance, since deposits of urates take place in the cartilages and in the ligaments, but become further enlarged and distorted. These local collections of urates are termed tophi, and they may be found in other joints — in the hands, knees, elbows, and even in the ear-cartilages. The frequent attacks of pain leave the patient much more irritable. He is apt to be dyspeptic, sallow-faced, and to show signs of disease in his heart and blood vessels. Under the term irregular gout have been grouped a veritable scrap-basket assortment of symptoms which different clinicians have thought were undeveloped cases of gout. By many authorities these irregular forms of so-called "gouty diathesis" are taken "with a grain of salt"; yet there is little doubt that a number of more or less definite symptoms are found in those who are moderately gouty which may be attributed to this disease. These irregular forms are frequent in gouty families and include certain forms of chronic eczema, attacks of biliousness with marked constipation, etc. Frequently there is a condition of arteriosclerosis (q.v.) with tendency to the development of slight dropsy or other symptoms of disease of the heart or kidneys. Nervous headaches or migraine may be another heritage, although migraine is such a common disturbance that its presence proves little for any of the many one-sided theories concerning it. Itching feet, hands, or eyeballs, irritable bladder with small quantities of acid, high-colored urine, are other symptoms attributed to irregular gout. Occasionally severe forms of eye-disease occur in those thought to be gouty, to account for which no other cause seems probable.

The cause of gout is really unknown. The theories are as numerous as the sands of the sea. A bad heredity is one of the most important factors, since from 50 to 60 per cent of gouty patients have had it left to them by their ancestors, one or two generations back. The boys seem more prone to this influence than the girls. Advancing age plays some part, the disease usually setting in before 50 years and generally after 40, although in the markedly hereditary forms the disease may come on much earlier, especially in the irregular manifestations. Alcohol is perhaps the most important contributory factor, those indulging in large quantities of fermented liquors seeming to be much more liable to contract the disease. Among the poor it is chiefly in the ale and beer drinkers that the disease is found. Overeating, lack of exercise, and minor injuries to the feet are also important causes of the development of gout. As for the general theories to account for the poisoning — for it seems like a poisoning — all at best are pure hypotheses. Uric acid is considered by many as the chief criminal, but beyond the fact that there is an increased amount of uric acid found in the urine during an attack, and deposits of a salt of uric acid in the joints, there is no proof of its causative influence. Many modern students believe this to be a purely secondary condition, and not a primary one. There is a marked increase in the metabolism of nucleoproteids (q.v.) which in large measure accounts for the increase in one of its products of oxidation, uric acid. Clifford Allbutt has well summed it up when he writes that we are far from sure that gout may not be due to some extrinsic element. The peculiar geography of gout is in need of careful inquiry; the effects of microbic infection of the kidney are unknown in their relation to the precipitation of uric acid. Again, some internal secretion may be at fault, as in diabetes. "Till we know then whether gout is a mere shortcoming in ordinary metabolism, or a peculiar perversion of it, or a static susceptibility of fibrous tissue, or a defect of some enzyme, or a perturbation of the nervous system, or again some factor from without, it appears we must confine the name of gout to the uratic precipitations which are known, and which can serve as a touchstone, and as to all other vague 'acidities,' 'flatulencies,' 'megrims,' and 'biliousness' of whatever occult kind, be content to treat them empirically, awaiting the results of the analysis of our nutritive life upon which biochemistry is actively and hopefully engaged." Summing up what is really known about the pathology of the disease, it seems established (1) that gout is a morbid condition, of which the most striking phenomena are acute attacks of arthritis (q.v.), which tend to recur and are accompanied by redness, pain, and œdema of the part; (2) that the affected joints are found to be the seat of a deposit of urate of sodium, which occurs first in the articular cartilages and afterward infiltrates all the surrounding structures; (3) that deposits of this material may also be found in other parts, such as the pinna of the ear, the bursæ, etc.; (4) that excess of uratic material may be demonstrated in the blood of a gouty patient, the amount being greatest before an acute attack, and least immediately after one; (5) that the influence of heredity in producing gout is undoubted; and that certain poisons, such as lead and malt liquors, may induce an attack. In the same manner our ignorance concerning the cause of gout may be summed up by saying (1) that it is not known how the excess of uratic matter is brought about, whether it is due to an increased intake with the food, to increased formation in the body, or to deficient elimination by the excretory organs; (2) that it is not known whether the uratic excess is the cause of the phenomena of the disease or is a mere casual accompaniment of the perverted state of nutrition; (3) that it is not known in the case of arthritic attacks whether the deposit of urate of soda is the cause or the effect of the local inflammation; in other words, that gout is a disease the cause of which is not yet understood.

The treatment, however, is on better foundations. Here empiricism has taught the general rule that most people eat and drink too much and that temperance in all things is beneficial in gout as in other experiences in life.

Treatment.— No routine line can be laid down that can be adapted suitably to all cases. Individualism — the treatment of the patient, rather than the disease — is the prime feature. The treatment for gout should include (1) the medicinal treatment of the gouty paroxysm, in acute gout; (2) the medicinal and dietetic treatment of the sub-acute and chronic conditions, and (3) the treatment of the affected joints, with the object of removing, if possible, the foreign deposits.

The horizontal or slightly elevated position for the limb, with a cradle to take off the weight of the bed-clothes, warm packs, soothing lotions such as the lead and opium wash, and an oil-silk

covering constitute the main features in the local treatment of an acute attack. Internally, colchicum, in dosage to be determined by the physician, is the best remedy. A brisk cathartic aids the action of the colchicum, and a mild diuretic may be combined to advantage — citrate of potash, cider, lemonade, being reliable. The pain and insomnia should be controlled by the visiting practitioner. Opium in all its forms is to be avoided. In the treatment of chronic gout attention must be paid to diet. Malt liquors are to be avoided, and the heavy wines, such as port and burgundy. There is no good reason why any particular form of food should be eliminated, but it is paramount that simplicity and undereating rather than overeating should be the rule. The so-called uric acid theory of gout is a pathological hobgoblin. Copious drinking of alkaline waters is of value — largely because of the water. Potassium salts seem to be of service. A bracing air, low humidity, absence of cold east winds, constitute the chief climatic conditions to be sought.

Smith Ely Jelliffe,
Editor 'Journal of Mental and Nervous Diseases.'

Goutweed, or **Goutwort,** a species of wild carrot (*Ægopodium podagraria*) introduced from Europe, where in England it is known as masterwort, herb-gerard, and now a weed in waste places along the Atlantic coast.

Gouverneur, goo'vėr-nėr, N. Y., village in St. Lawrence County; on the Oswegatchie River, the Rome & W. R.R.; about 40 miles south of Ogdensburg. It has large marble works; the talc mines nearby are well developed, and considerable iron ore is mined, and wood-pulp is manufactured. It is in a good agricultural region. Pop. 3,700.

Government is the term used to describe the mechanism or *ensemble* of agencies through which a body-politic formulates and executes its will.

Governments de facto and de jure.— Since they act only as the agents of the sovereign political power, governmental agents in order legally to exercise the functions of their offices, are obliged to possess a delegation of powers from the state they represent. In case they are not able to produce a sufficient evidence of this authorization, their acts are *ultra vires,* and as such of no legal force, and they themselves are subject to civil or criminal suit at the instance of parties whose persons or property they may have injured by their acts.

It not infrequently happens, however, that persons claiming political authority, while able to produce satisfactory evidence of their official status and competence, do so by referring to grants of power from a political sovereignty, the legitimacy of which is not admitted by the parties over whom their authority is attempted to be exercised. It thus becomes necessary to distinguish between governments *de facto* (*sed non de jure*) and governments *de jure.*

The terms *de facto* and *de jure* are applicable to governments in a purely relative sense. That is to say, which of the two is properly descriptive of a given political organization depends upon the point of view of those who characterize it. Thus a government is *de jure* as well as *de facto* when it has been established by, claims to represent, and is in fact guided by the will of a state the legitimacy of which is recognized by the individuals over whom its control is extended. It is *de facto* but not *de jure* to any particular individual when, though actually in existence and able to exercise a certain amount of power, its legal character is denied by that individual. Thus in the case of an attempted revolution; from the standpoint of those who have repudiated their allegiance to the old state, refuse obedience to its government, and have organized for themselves a new political machinery, the old government has but an actual and not a legal existence, the new government being the only one in their eyes possessing a legal basis. Upon the other hand, from the point of view of those who still support the old state, the newly established government has but a *de facto* existence, the old government being conceived as the one legal organization. Thus, during the American Civil War, the existence of the southern Confederacy as a state was never recognized by the United States nor by foreign powers. The existence of a *de facto* Confederate government was, however, admitted, and its soldiers recognized as belligerents. The continued allegiance of its supporters to the United States was, however, always asserted by the United States, and no legal force of any sort was ever ascribed, then, or after the end of the war, to any of its acts. No formal treaty of peace was entered into with the southern Confederacy, the surrender of its armies being received simply as military acts, and its government permitted to go out of actual existence without any formal act to mark its demise.

The Ethical Right of Governments to Exist. — The concrete question as to the moral right of a particular government to exist and to coerce individuals, is often confused with the abstract one as to the moral justification for the existence of political restraint in general. These two questions are, however, quite distinct, and are to be answered upon quite different principles. So long as men's interests conflict, or, at least, so long as they are conceived by them to conflict, coercion of some sort must result, for the desires of all, under such circumstances, cannot be satisfied. Some will have to give way to others, or all yield in part. The force bringing about the final settlement may be individual, social, political, or religious, but in any case restraint is applied and the freedom of action of the individuals concerned correspondingly interfered with. This being so, it is clear that the question as to the ethical legitimacy of coercion by the state is not to be answered by viewing such coercion as a restraint upon individuals who otherwise would possess entire freedom of action. Rather it is to be viewed as a control of individuals who, but for the existence of political government and law, would be subject to the compulsion of other forces. In other words, so long as men's desires conflict there cannot properly be raised the abstract question as to the rightfulness of restraint humanly imposed, or even the question as to its proper amount. The conflict of desires makes coercion inevitable, and the extent of this conflict fixes its amount. The only questions, therefore, that rightfully may be raised are as to the form that the compulsion shall assume, and the general principles that

shall guide it. The justification, then, for the existence of any particular political authority, if justification there be, consists in the fact that it furnishes a more intelligent, more beneficial, more just, and less painful form of restraint than that which, in its absence, any other force or forces would supply. A state and its government is but an instrument humanly devised for a people's good. It, therefore, has to be justified by its works. There is, thus, no theoretical difficulty in conceiving of a political authority so corruptly and oppressively administered as to cause evils overbalancing those that it prevents. In such a case, it has no ethical right to be. Practically speaking, however, there can be no question but that so grievous are the inevitable evils of lawlessness and anarchy that it is difficult to picture to oneself a political régime so evil in its effects as to render preferable to it a complete absence of political order.

To repeat, then, for the question so often stated in the abstract form as that of the right of the state to be, should be substituted that as to the right of its government to be and to exercise the functions that it does and to exercise them in the manner that it does. As the author of this article has elsewhere had occasion to state it: "The right to be of the political authority itself is not in issue, for, abstractly considered, that is, as apart from any particular form of organization, or manner of operation, there is no basis upon which a judgment may be founded. It is not until the state manifests its power and authority that material is afforded to which moral estimates may be applied."

The Doctrine of the "Consent of the Governed." — We are now prepared to examine the meaning and validity of that doctrine, promulgated in the Declaration of Independence, and accepted as fundamental in American political philosophy, according to which all governments "derive their just powers from the consent of the governed."

Without stopping to consider what the founders of the American Union probably meant by this phrase, it may be here said that the principle stated by it has a validity only in so far as it is held to state or imply that all governments should be so administered as to promote to as high a degree as is possible the good of all the governed; and that, therefore, the governed have at all times the moral right — though not necessarily the legal right — to see to it that this is done, and consequently the right, if there be no better way, of overturning an existing government and establishing in its place one more likely to subserve their own general good. Impliedly, then, the doctrine properly means that every state should be so organized as to render possible and easy the discovery of the best interests of the governed. As, however, generally speaking, these best interests are most certainly to be determined by the intelligent wishes of those concerned, this means, in the first place, that, so far as the state itself is able to provide them, agencies should exist for developing the intelligences of its citizens and thus qualifying them to know their own best interests; in the second place that adequate provision should be made for the free expression by the people of their wishes; and, finally, in the third place, that sufficient guarantees should exist that these wishes when made known will be heeded by those in power.

That the foregoing requirements of an ethically defensible government may be satisfied, it is necessary that all public officials shall be held strictly responsible, politically and civilly, for the manner in which they exercise the powers entrusted to them; that freedom of speech and press shall prevail; that the rights to petition, to assemble peaceably, and to bear arms shall exist; and that political privileges — the suffrage and the right to be elected or appointed to public office — shall be as widely extended as the intelligence and morality of the citizens will permit. Speaking negatively the doctrine of the "consent of the governed" does not support the legal right, nor, except in extreme cases, the moral right, of each individual citizen to refuse obedience to particular laws which he may consider unjust, nor at will to cast off his allegiance to his state, nor to claim the suffrage or public office as an abstract right.

The ethical right of one people forcibly to subject another people to its political authority, that is, to destroy the sovereignty of its state and annex its territory, as, for example, the right of the United States to control the political destinies of the Filipinos, or of England to extend her authority over the peoples of the South African Republic (Transvaal), and the Orange Free State, is a somewhat different question from that of the right of a particular government to exercise a control over its own citizens. There is an exceedingly strong presumption not only that a given people best knows its own interests and the means of advancing them, but that, stimulated by the consciousness of national independence, it will develop its latent potentialities in a manner that it will not, or cannot, do when subjected to an alien authority. But this presumption, however strong, is one that may be rebutted. It may be made sufficiently plain that a people, because of a lack of intellectual and moral development or a deficiency in natural ability and temperament, is not able either to perceive its own best interests or so to govern its conduct as to realize them when perceived, or, in determining upon its domestic or foreign policies, to give sufficient weight to the moral and legal rights of other states and their citizens. The interests of civilization are superior to those of any particular people. Judged from this general standpoint, it may, therefore, often happen that the forcible subjection of one people to the political rule of another is justified. This right of course appears most plainly in the case of the subjection of an uncivilized people to a civilized nation, but is not necessarily limited to such a case. The continued unsatisfactory political conditions existing among many of the peoples of South and Central America, of the races inhabiting the Balkan Peninsula and of the whole of the Turkish dominions certainly furnishes to the other states of Europe and America a very strong basis of right to intervention. The language of Prof. J. W. Burgess is hardly too strong when, after adverting to the fact that it is in the interest of the world's best civilization that law and order and the true liberty consistent therewith shall reign everywhere upon the globe, he declares that "a state or states, endowed with a capacity for political

organization, may righteously assume sovereignty over, and undertake to create order for, a politically incompetent population."

Classifications of Governments.— As many different classifications of governments may be made as there are characteristics of governments suitable for selection as differentiating elements or factors. The best known of these possible classifications is the one that has come down to us from ancient times, which divides the various kinds of political organization into three main classes, according as the supreme political control is in the hands of a single individual, in which case the government is known as a monarchy; in the hands of a few persons, when it is described as an aristocracy; or in the hands of the general citizen populace, when it is termed a democracy. A further, or sub-classification divides each of these three types into normal and corrupt forms, the corrupt monarchy being termed a tyranny, the corrupt aristocracy an oligarchy, and the corrupt democracy an ochlocracy or mobocracy. A still further subdivision divides monarchies into elective and hereditary according to the source whence the monarch derives his right to office; and into absolute or limited (or constitutional) according as the monarch in the exercise of his authority, is, or is not, controlled by definite constitutional principles and by the action of other governmental officials selected by the people; aristocracies into particular types according to the principle, wealth, or birth, upon which membership in the ruling class is determined; and democracies into direct and indirect according to whether their people directly participate in the control of the state or delegate the exercise of their sovereign powers to officials selected by and responsible to themselves. In the latter case the government is known as a representative democracy or republic. The Constitution of the United States, without defining the term, provides that: "The United States shall guarantee to every State in this Union a republican form of government." The Federal courts, though they have several times been called upon to construe and apply this clause, have never attempted directly to determine the meaning of the term "republican form of government." The eminent constitutional jurist, Judge Cooley, gives, however, the following definition which has been generally accepted as correctly expressing the meaning of the phrase as employed in American law and American political thought:

By republican government, he says, is understood a government by representatives chosen by the people, and it contrasts on one side with a democracy, in which the people or community as an organized whole wield sovereign powers of government, and on the other with the rule of one man, as king, emperor, czar, or sultan, or with that of one class of men, as an aristocracy. In strictness, a republican government is by no means inconsistent with monarchical forms, for a king may be merely an hereditary or elective executive, while the powers of legislation are left exclusively to a representative body freely chosen by the people. It is to be observed, however, that it is a republican form of government that is to be guaranteed; and in the light of the undoubted fact that by the Revolution it was expected and intended to throw off monarchical and aristocratic forms, there can be no question but that by a republican form of government was intended a government in which not only would the people's representatives make the laws, and their agents administer them, but the people would also, directly or indirectly, choose the executive. But it would by no means follow that the whole body of the people, or even the whole body of adult or competent persons, would be admitted to political privileges; and in any republican state, the law must determine the qualifications for admission to the elective franchise.

Another term, often used as synonymous with democracy, is popular government. Strictly speaking, however, this latter term should be employed not to designate any distinct form of political organization, but to describe any government the actual administration of which is to a considerable degree subject to the control of the people. A popular government is thus, in effect, a free government and as such is properly to be contrasted with a despotic government in which the will of the ruler or rulers and not that of the ruled controls. It is in this sense that we speak of the movement toward popular government as having made great strides in England and elsewhere during the last 75 years, though monarchical forms have still been retained.

So closely connected with the advance of popular government, as to be almost identified with it, has been the development during the last century of constitutional government. Those general principles, written or unwritten, that determined the governmental organization of a state and fix the legal competences of its several organs and officials, taken collectively, are termed its constitution. In this sense every state has a constitution, and its government may be spoken of as constitutional. But in its stricter and more usual sense, a constitutional government is one in which the principles determining its specific character, and the extent and mode of exercise of its powers, are definitely determined, and, in general, reduced to precise written statement, and embodied in an instrument or instruments which are not subject to abrogation or amendment except according to certain specified formalities. By this means not only are definiteness of authority, and responsibility of those in power secured, but guaranties provided that existing political liberties shall not be changed except under conditions which usually include a popular assent directly or indirectly given. The value of constitutional government is thus usually but not necessarily that in it the exercise or the direct control of sovereignty is placed in the hands of the people. Its essential feature is that the manner in which the sovereign power is to be exercised by the state is definitely determined. A constitutional government, may therefore, both in form and effect, be but slightly popular in character. In fine, then, the difference between a constitutional and a popular government is that in the former the attempt is made to render the citizens secure against arbitrary action on the part of their rulers; in the latter, means exist for discovering and enforcing the wishes of the governed. The progress of popular government and of constitutional government, has almost always gone hand in hand, for the reason that it is but natural that, once established in the effective control of their states, the citizen bodies should have sought to render their power secure by the adoption of instruments of government that might not be altered except under certain prescribed conditions.

The truest tests of the excellence of all governments are the facilities they afford for the formation of an enlightened opinion of the people upon matters of political importance and the precise ascertainment of that "general will"

when formed, and the exactness with which the policies it dictates are carried out in practice. The development of popular constitutional governments means that these results are being achieved to an increasing extent. As Prof. Lester F. Ward has said: "Government is becoming more and more the organ of social consciousness, and more and more the servant of the social will. Our Declaration of Independence, which recites that government derives its just powers from the consent of the governed, has already been outgrown. It is no longer the consent, but the positively known will of the governed, from which government now derives its powers."

A characteristic feature of almost all constitutional governments is the existence of a system of what have been called "checks and balances." According to this system the several functions of political rule are so distributed among different organs of government that no one of them is given sufficient power to assume an autocratic, despotic control of the state. Thus, in general, the making, the interpreting, and the enforcing of laws are placed in different hands. The executive is thus unable to take legal action without the authorization of the legislature, and the acts of both the legislature and executive are subject to review in the courts. Furthermore, the legislative body is usually divided into two chambers, the approval of both, together with that of the chief executive, being required for a valid act of legislation; executive officials are often elected for but short terms of office, and in case of nonfeasance or malfeasance of office are subject to impeachment and summary removal from office, and subject to civil and criminal suit for any illegal conduct while in office. In the United States of America the most powerful check of all consists in the fact that the courts have the power of declaring void all legislative acts inconsistent with the provisions of the written constitutions of the United States and of its constituent commonwealths. In those European states which possess written constitutions the courts have not this power, the legislatures being construed to be the judges as to the constitutionality of their own acts.

Presidential and Parliamentary Governments.— A very important classification of constitutional governments is that which divides them into Presidential and Parliamentary.

Presidential government, to accept the excellent definition of Burgess, "is that form in which the state, the sovereign, makes the executive independent of the legislature, both in tenure and prerogative, and furnishes him with sufficient power to prevent the legislature from trenching upon the sphere marked out by the state as executive independence and prerogative." Thus the governments of the United States and of Germany are of this type. Upon the other hand, "Parliamentary government is that form in which the state confers upon the legislature the complete control of the administration of law. Under this form the legislature originates the tenure of the real (though perhaps not the nominal) executive, and terminates it at pleasure; and under this form the exercise of no executive prerogative, in any sense and manner unapproved by the legislature, can be successfully undertaken." As further descriptive of this parliamentary type it should be said that this controlling power thus vested in the legislature, almost inevitably tends to become concentrated in its more popular chamber. The government of England best illustrates this form of government. That of France may also be placed in this category. Because the real executive power in a parliamentary government is almost always in the hands of a cabinet of officials holding office only so long as they are able to retain the support of the legislature, this form of political rule is often spoken of as Cabinet government.

The Sphere of Government.— The legal power of a constitutional government at any given time is determined by law. The sphere of political control thus marked out includes all those interests which the state has determined require public control. As we have already learned, legally the state is omnipotent, and therefore may subject to its regulation any matter that it sees fit. Actually, however, considerations of utility and expediency of course control. Regarding the exercise of certain powers, no opportunity for the employment of discretion exists. In order to maintain itself as a sovereign, independent body-politic, it is absolutely necessary that the state should obtain sufficient means, and exercise sufficient authority, to protect itself against attacks from foreign sources, and to maintain law and order, that is, to protect persons and their property throughout its own dominions. The powers, the exercise of which is thus called for, may, therefore, be termed "essential powers," and in the aggregate they constitute the essential sphere of the state. By some writers they are spoken of as "police powers." German writers, however, it should be said, use this term somewhat differently, designating as a "Police State" (*Polizeistaat*) one that English and American writers denominate a "Paternal State." The propriety of the exercise by the political power of these essential duties is not denied by any one except the anarchist. Contrasted to these essential, or, to use the adjective employed by President Wilson, the "constituent" functions of government, which must be exercised by a state in one way or another, are what may be called the non-essential or ministrant functions which all civilized states to a greater or less extent exercise. The activities included in this class are those performed by the state for the promotion of the economic, physical, and moral welfare of its people.

As not being absolutely essential to the very existence of the state, there are many who while admitting the necessity for, and the rightfulness of, political control in matters of police protection and national self-defense, assert that the assumption by the state of a right thus further to control the conduct of its citizens, is an ethically unjustifiable interference with their freedom, even though the aim of such interference is to advance their own good. In order to maintain this position, however, they are obliged to fall back upon a doctrine of "natural rights," the invalidity of which is now all but universally recognized. Starting, as from a premise, with the right of a particular state or government to be, as determined by the principles already laid down in this article, the conclusion necessarily follows that, in each

individual case, the question whether or not a given matter, whatever its character, shall be subjected to public control, is one the answer to which should be determined wholly by expediency — construing of course expediency so as to include moral as well as material considerations. The arguments of those who urge the establishment of a socialistic or communistic régime are, therefore, not to be met by the simple predication of an abstract individualistic, *laissez-faire* doctrine, according to which an extension of state activities beyond the mere maintenance of order and national independence, is ethically unjustified whatever the results to which it may lead. The claims of socialists and communists, in other words, may properly be rejected only by showing that the actual results to which their proposed politics, if adopted, would in all probability lead, would be ethically unjust, or economically disastrous, or both.

This is not the proper place to discuss either socialism or communism. This one observation may be made, however, that the performance by the state of non-essential duties is not, in very many cases, a step toward socialism. The essential aim of socialism is to suppress competition. When there is assumed by the state a function which otherwise would certainly, or in all probability, not be performed at all, it can hardly be said that the field of private initiative is thereby lessened. Under the head of these non-essential, non-socialistic duties, may be grouped all those state activities that are educative rather than coercive, informative rather than controlling. Of this character, for instance, is almost all of the work done in the Departments of Labor and Commerce, and of Agriculture, the Bureau of Education, the Fish Commission, and other scientific bureaus of the United States government.

As to what the actual sphere of government in America and Europe is destined to become within the next few years we, of course, can only speculate. The probabilities, however, would seem to be that we are to see a considerable extension of state activities in the sphere of these non-essential, non-socialistic functions. The movement in this direction has for some time been very pronounced and is certainly one not to be deprecated. In the field of socialistic activities, namely, those the exercise of which by the state almost necessarily involves a corresponding diminution of the field of possible private enterprise, the greatest extension of public control within the immediate future will in all probability be seen in the assumption of the ownership and control by central and local governments of the so-called natural monopolies, and in the regulation by law of privately owned and managed industries in which the interests of the general public have become pronounced. Whether the movement toward increased governmental control in this last respect will proceed as rapidly as it has done during recent years one cannot say. The observation may be made, however, that, together with those forces, which, born of the increasing complexity of our social and economic life, tend to make necessary an extension of the activities of the state, there are other agencies the influence of which may be in the opposite direction. Out of an increased intellectual enlightenment and a more widely diffused spirit of altruism may easily arise both an increased ability and a stronger disposition to solve social and economic problems without a resort to the coercion of law. See STATE.

W. W. WILLOUGHBY,
Johns Hopkins University.

Government by Injunction, a term used to characterize the putting down of strikes by judicial power of laying injunctions. The first direct interference of the national government in labor troubles was the dissolution of the great Pullman strike at Chicago in 1894, on the ground that it interfered with the carrying of United States mails. This was an executive act; but the courts have since interfered in cases where violence was making the transaction of government business impossible, and brought irresistible government power to bear.

Government Printing House, a large printing establishment at Washington, D. C., controlled and operated by the government for the publication of congressional proceedings, department reports, scientific bulletins, etc. It is considered the largest printing-office, public or private, in the world. A new building was erected in 1902 for its accommodation at a cost of about $2,500,000. Its floor space represents a total area of 14 acres. More than 4,000 persons are employed in this establishment. The cost of maintaining the establishment approximates $6,000,000 per year.

Government of the United States. See UNITED STATES.

Governor, in the United States. The head of an English trading corporation, as the East India Company or the Bank of England, was called the governor; hence it was natural to give that title to the heads of the colonies which grew out of them. These governors were elected by the people in Connecticut and Rhode Island, and down to 1686 in Massachusetts; in the crown colonies they were appointed by the sovereign, and in the proprietary colonies by the proprietor. The name, from the long struggles with the royal governors, had a disagreeable sound in the public ear in many colonies; and when the Revolution swept these away, in several cases they were replaced by councils, of whom the president or chairman was really the governor. Hence, in those times "President" of a State was often used as a current though not official title. Where and when a single executive was adopted, south of New York he was at first usually chosen by the legislature. At present, in most States the governor has a veto, which may be overridden in all cases by a two thirds vote of both Houses, and in some by a bare majority. Sometimes he has the power of granting pardons; in other cases he is one member of a board of pardons. He sometimes appoints commissions and executive boards. He is always commander-in-chief of the State militia, and is obligated to assist local officers in suppressing insurrections, and is empowered to call on the President for help if necessary; in turn, he is the President's chief agent in furnishing men and supplies in case of national war. And like the President, he sends a message to the legislature at the beginning of each session, recommending such legislation as he wishes.

Governor, a device which regulates the admission of steam to a steam-engine, according to the rate of motion. The intention is to maintain uniform velocity, and any acceleration of speed above a given rate causes a valve to be partially closed, diminishing the area of steam passage. The favorite form of governor has a pair of balls suspended from a vertical shaft, so as to swing outward when the shaft is rotated. The greater the speed the greater the centrifugal force, and consequently the farther the balls depart from the axis of rotation: the inclination of the ball arms is made effective in working the valve. See STEAM-ENGINE.

Governor's Island, a small fortified island in New York Bay, south of the Battery, and at the entrance to East River. It is separated from Brooklyn by Buttermilk Channel. In 1621, under the name of Nutten Island, it was a station of the West India Company. Later it was used as a residence by the colonial governors of New York, hence its present name. Wouter Van Twiller was the first governor (1637) to use the island for a country residence. In 1708 it was in use as a quarantine station, and in 1784 Gov. George Clinton leased the island to a company who used it for a summer resort and a race-course. Lord Cornbury in 1702 and Gov. Hardy in 1756 urged the erection of batteries on the island: but no definite action was taken until 1794, when there were rumors of a war with France, the State of New York appropriated $250,000 for the erection of a fort and earthworks. The general government appropriated $31,117, and the money was expended for the construction of Fort Jay in the centre of the island. Other sums were used later in improving the fort, but in 1801 the work ceased until 1806–7, when from "an enclosed work of earth and wood" the fort was improved and faced with permanent masonry at a cost of $30,000, and was named Fort Columbus, as at present. The designs for Fort Columbus, also Castle Williams, were made by Jonathan Williams, Lafayette's chief engineer of the army. The plans called for 104 guns for Fort Columbus and 100 guns for Castle Williams. The latter fort exists to this day (1903) practically as it was when completed in 1811. Its area is three fifths of a circle which is 200 feet in diameter, and the walls are 40 feet high. In 1861–5 Castle Williams was used as a prison for Confederates; at one time there were as many as 1,000 prisoners. After the War of 1812 a fortification called South Battery was built at a place to command Buttermilk Channel. Governor's Island is the army headquarters of the Department of the East, a most important military post, embracing the coast from Maine to Florida and including Porto Rico. It has less the look of war than many smaller forts, but it has a garrison usually of three companies, and it is used as a military prison, nearly all the prisoners being deserters. A little church, under the care of Trinity parish, Manhattan, residences for the officers and some storage places are the only buildings in addition to the forts. At the beginning of the 17th century the island was 1,500 feet long and 900 feet wide with an elevation above high-water of 20 feet. Its whole area then was 100 acres. The tide-waters have washed away a large portion of the island, and now (1903) the area is only 65 acres. The War Department has begun the work of reclaiming from the sea the land washed away. It is expected that in 1904 or 1905 the island will be restored to its former area. The need of modern forts and better defensive equipment on Governor's Island no longer exists since an excellent system of fortifications has been established at the entrance to The Narrows and along the shores of Long Island Sound.

Governor's Island, a fortified island belonging to Suffolk County, Mass., in Boston harbor. It is just north of the main ship-channel and of Castle Island. The fortifications form part of the system of defense of Boston harbor. Fort Winthrop, the keep or réduit, is an enclosed quadrangular fort with open barbette batteries.

Gow'er, John, English poet: b. probably about 1330; d. London October 1408. But little is known of his life save that he was rich and well educated, did not marry till late in life, and became blind about 1400. His tomb is still to be seen in St. Saviour's, Southwark. He was a personal friend of Chaucer, who, in dedicating to him his 'Troilus and Cressida,' addresses him as the "moral Gower" — an epithet that has indissolubly linked itself with his name. Gower wrote three large works in as many languages: the 'Speculum Meditantis,' in French verse, not now extant; the 'Vox Clamantis,' a tedious poem in Latin elegiac verse, written 1382–4, describing the rising of the mob under Wat Tyler; and the long poem entitled 'Confessio Amantis,' written "in our English . . . for England's sake," the date uncertain, but at least the poem was in existence in 1392–3. There are extant also 50 French ballads, written by Gower in his youth (Roxburghe Club, 1818).

'Confessio Amantis' consists of a prologue and eight books, written in verses of eight syllables, rhyming in pairs. The long prologue gives a sombre account of the state of the world at that time, and the poem opens by introducing the author himself in the character of an unhappy lover. It ends with the lover's petition in a strophic poem addressed to Venus, her judgment, and finally the lover's cure and absolution. Without originality, narrative power, pathos, or humor, Gower yet commands respect for the laborious equality of his verse, and his work remains a splendid monument of English. The best edition is that by Pauli (1857). There is a serviceable reprint by Henry Morley in his 'Carisbrooke Library' (1889).

Gower, LORD **Ronald Sutherland,** English author and sculptor: b. 1845. He was the second son of the 2d Duke and 20th Earl of Sutherland. Educated at Trinity College, Cambridge, he sat in Parliament for Sutherland, and also became known as the sculptor of such works as 'The Old Guard at Waterloo,' and the Shakespeare monument at Stratford-on-Avon. Among his writings are: 'My Reminiscences' (1883), a work of much interest; 'The Tower of London' (1901); and 'Old Diaries.'

Gowrie (gow'rĭ) **Conspiracy,** an unexplained episode in Scottish history. On 5 Aug. 1600, James VI., afterward James I. of England, came to Gowrie House, the residence of the Earl of Gowrie, in the suburbs of Perth, having been lured thither, according to one account, by the report of a suspicious person there held in

custody. After dining, the king was led aside by Alexander Ruthven, younger brother of the earl, and the king's attendants were told that his majesty had left the castle. An attempt was made by Ruthven, either to murder or to bind the king, who struggled desperately and shouted for help. His retinue coming to his rescue slew Ruthven and Gowrie. The motives of the two brothers have been variously explained. The current belief is that they intended to capture the king and either give him up to England or administer the government in his name in the interest of that country and in that of the Scotch Presbyterian leaders. Others supposed that their object was merely to avenge the death of their father, who had been executed a few years previously. The heavy indebtedness of the king to Gowrie was another cause of irritation. Gowrie House was destroyed and the estates confiscated.

Goyanna, gō-yän'nä, Brazil, city in the state of Pernambuco; on the Goyanna River, about 20 miles from the Atlantic. It is a shipping port for sugar, dyewoods, cabinet woods, and cotton. Pop. 5,000.

Goyaz, gō-yäz', Brazil, a state completely enclosed between the states of Maranhão, Piauhy, Bahia, Minas Geraes, São Paulo, Matto Grosso, and Pará. Its area is estimated at 747,311 square kilometres, or, say, 287,714 square miles; but, as a large part of the Araguaya-Tocatins basin is unexplored, a precise statement in regard to the extent of its territory cannot be justified. The Goyaz plateau with the Pyreneus Mountain range constitute the watershed which divides the basin of the Tocatins and Araguaya rivers from the São Francisco and Paraná basins; the headwaters of the Araguaya and the Paraguay are near one another; and thus the point of divergence of great river-systems is found within this state. The climate of the plateau is excellent; among the mountains extremes of heat and cold are felt; and large districts are well adapted to agriculture. Forests extend along the river-courses, while the elevated lands of the interior have only occasional clusters of trees. The chief products are tobacco, rubber, and cattle; the gold and diamond washings which at one time were supposed to be important now yield very little. The capital, Goyaz, formerly called Villa Boa, has about 8,000 inhabitants. The population of the state was given as 260,395 in 1901, but of that number nearly all were Indians or Mestizos, the civilized element being inconsiderable as yet. The special interest attached to this state is due to a circumstance which is mentioned in a geographical sketch of Brazil (Washington 1901; compiled by the Bureau of the American Republics), in the following terms: "This state enjoys a splendid climate, and has been selected for the site of the future capital of the republic, the constitution providing for its location on the plateau of Goyaz. A special commission, at the head of which is the director of the observatory of Rio de Janeiro, has already marked the site for the new capital, which is a space 14,400 kilometres square on the Upper Tocatins, in the Pyreneus range of mountains. It has an elevation of from 200 to 300 metres above the level of the plateau and is drained by numerous streams of pure water, being the centre of the three hydrographic systems of Brazil. . . . It is here, near the point of divergence of her three great rivers, that Brazil wishes to establish the national capital." But the site thus selected has no natural means of communication with the Brazilian coast. The Tocatins-Araguaya is navigable for only about one tenth of its entire length; its course is broken by falls and rapids, and as it approaches the Gulf of the Amazon it becomes very shallow. Canals and railways would be required in order to make the rivers commercial highways; moreover the state is without seaboard — is, indeed, far inland. The isolation of the proposed capital suggests that of Bogotá.

MARRION WILCOX,
Authority on Spanish America.

Gracchus, grăk'ŭs, **Tiberius Sempronius** and **Gaius Sempronius,** two Roman statesmen: b. about 163 B.C. and 159 B.C.; d. 133 B.C. and 121 B.C. In their attempt to obtain reforms favorable to the commons, they awakened popular commotions of which they themselves became the victims. Tiberius served under the command of his brother-in-law, the younger Scipio, at the siege of Carthage, and was the first man to mount the walls. He was subsequently quæstor to the consul Mancinus, who at that time waged war against the Numantines in Spain. After the defeat of Mancinus, he concluded a treaty with the Numantines, which, without being disgraceful to the Romans, secured to the Numantines their independence. This treaty, however, was opposed by the aristocratic party and repudiated by the senate. Tiberius, nevertheless, upheld by the populace, in 133 B.C. was elected tribune of the plebs, and sought to reform the condition of the poorer citizens who were without land, and, since the great estates of the wealthy were cultivated by slaves, also largely without employment. He endeavored to attain his object by the revival of the Licinian Rogations of 367. It had been decreed, on the proposition of the tribune, Licinius Stolo, "that no one should possess more than 500 acres (*jugera*, each 28,000 square feet) of the public domain (*ager publicus*), and that the overplus should be equally divided among the plebeians." This law, which was now called the Gracchan, the Sempronian, or by way of eminence the agrarian law, he revived, but with the introduction of several softening clauses. The proposition of Tiberius Gracchus was met with the most determined opposition by the ruling party. To counteract his plans the senate gained over one of the tribunes, Marcus Octavius; and when Tiberius, after having, according to custom, exposed his law 19 days to the public view, proceeded to take the votes of the assembled people upon it, Octavius interposed with his veto, and thus seemed at once to have defeated the whole undertaking. Tiberius now exerted all the prerogative of his office, sealed up the treasury, and forbade all the authorities the discharge of their several offices. He saw, however, that this was of no service to his plan. He therefore took a step till then unheard of in Roman history. At the next assembly of the people he obtained the expulsion of Octavius from office, as faithless to the cause of the people. The bill was thus passed, and a committee consisting of Tiberius himself, his brother Gaius, and his father-in-law Appius Claudius appointed to carry out its various provisions. All the difficulties which

stood in the way of the law now appeared in their full light. Even the preparatory business of ascertaining which was the public land, and which private property, was found to have its full share. Outcries and complaints were made from every part of Italy. When June of the following year came on, in which the tribunes for the next year were to be elected, Tiberius, who had endeavored to regain the favor of the people by some new propositions, offered himself again as a candidate for the office. The aristocrats used every effort to prevent his election, and the ferment in Rome was carried to the highest pitch. One election day went by without any election being made. On the next a vast multitude beset the forum, and the senate assembled in the neighboring Temple of Faith (Fides). Tiberius strove in vain to speak, and was killed in the tumult which followed. The place of the murdered Tiberius was filled by Licinius Crassus, father-in-law of Gaius Gracchus; and on his death Carbo, Fulvius Flaccus, and Gaius Gracchus constituted the committee appointed for the enforcement of the law.

In this way the parties had struggled with varying success, when, in 123 B.C., the younger Gracchus, who, as quæstor, had been with the army in Sardinia, obtained the tribuneship. With more various and shining talents than his brother, he united a stormy eloquence, which carried away his hearers. In the discharge of his office as tribune he first of all renewed his brother's law, which had meanwhile fallen into disuse, and revenged his memory by expelling many of his most violent enemies from the city. At the same time he carried through a law "that every month corn should be sold to the poor at a low fixed rate," and by another law effected some alleviations in the rigor of the military service, and ensured for the soldiers clothing, besides their pay. The people were animated with an unlimited enthusiasm for their favorite; his enemies were terrified and weakened; hence he obtained the renewal of his office for the following year with ease. His attempt to introduce 300 knights into the senate failed; but on the other hand, at his proposal the administration of justice was taken from the senate and transferred to the equestrian order. This gave rise to a new political power in the Roman commonwealth, which, holding a station intermediate between the senate and the people, had a most powerful influence in its subsequent history. The senate now resorted to a new but sure means of destroying Gaius. Livius Drusus, a tribune gained over to their interests, had the art to withdraw the affections of the populace from Gaius by making greater promises to them, and thus obtained a superior popularity for himself and the senate. Hence it resulted that Gaius did not obtain a third tribuneship, and Opimius, one of his bitterest enemies, was chosen to the consulate. In the ensuing civil disturbances Gaius was killed at his request by his slave.

Grace, William Russell, American merchant: b. Queenstown, Cork, Ireland, 10 May 1832; d. New York 21 March 1904. In 1846 he worked his way on a sailing vessel to New York; in 1850 went to Callao, Peru, where he became a clerk in the shipping office of Bryce & Company, and later partner in the firm, which eventually assumed the style of Grace Brothers & Company. He organized the firm of W. R. Grace & Company, now the leading American house in the South and Central American trade, with main offices at New York, and branches at London, San Francisco, Lima, Callao, Valparaiso, Santiago, and Concepcion. In 1891 he also established the New York and Pacific Steamship Company. He was Democratic mayor of New York in 1881–2 and 1885–6. His philanthropies were numerous, including the gift of one fourth the cargo of the U. S. S. Constellation, despatched to the aid of the Irish famine sufferers of 1880; and large sums for the building and maintenance of the Grace Institute, established by him in 1897 at New York for the instruction of women in domestic arts and sciences, trades, and occupations. He became a member of the American Museum of Natural History and the American Geographical Society, and organized and was elected president of the Nicaraguan canal syndicate, an organization of capital for securing to the United States control of the waterway.

Grace of God, an expression borrowed from St. Paul's writings. The Apostle frequently employs the term grace in the sense of a gift which enables those who have it to do what they could not do without it. In common parlance we use such expressions as the "gift of music," the "gift of poetry," as belonging to one who might acquire many accomplishments, but could never acquire what is meant by a gift for anything. St. Paul, speaking of his own conversion, his calling to the apostolate, and his many labors, says: "By the grace of God I am what I am." Again he addresses his followers in these words: "By grace are ye saved; not of yourselves, it is the gift of God."

The Church of England and the Protestant Episcopal Church in the United States teach that grace is the assistance given by God to those who believe in Him, so that they may please Him and keep His commandments. All the Reformed Churches agree on this point and they also agree that no man can do good works "as God hath willed and commanded them to be done" (39 Articles), that is, from a right motive and in a religious spirit of devotion, without the grace of God. They also teach that the principal means of grace is prayer, and study of the Scriptures, which latter make a man "thoroughly furnished unto all good works" (1 Tim. iii. 17). To these means of grace the Catechism in the Book of Common Prayer adds the two sacraments, of Baptism and of the Lord's Supper, which are not only means of grace, but also "outward and visible signs" and "pledges" of the grace received by those who participate in them. The following is the doctrine of the Roman Catholic Church regarding grace, which that Church has made plain by dogmatic definitions. As defined by the eminent Roman Catholic theologian, Perrone, grace is "that gratuitous inward aid (*auxilium*) which God affords to fallen man through Christ's merits, to enable him to perform supernatural acts, so that he may attain justification and persevere therein" (Prælect. Theol., c. de Gratia). The Roman Catholic Church's doctrine of grace is opposed on one side to the teachings of Pelagius, who denied the necessity of grace, and on the other to the teachings of those who held that without grace every act of man is a sin, and specifically

that "the constancy of Socrates, the continence of Xenocrates . . . must be regarded, not as virtues but as vices" (Melanc. Loci Theol.); and that "from man's corrupt nature proceeds naught that is not worthy of condemnation" (damnabile: Inst. i. 2). Roman Catholic doctrine holds the middle ground between these extremes. As against the Pelagians the Roman Catholic Church teaches that for all acts conducive to salvation (*salutares*) the inner grace of the Holy Spirit is necessary (Conc. Trid. Sess. VI., can. ii. 3). As against Melancthon, Baius, and the Jansenists, the same Church teaches that fallen man, before he receives the gift or grace of faith, can perform acts that are morally good. Further, the Roman Catholic Church, in opposition to the teaching of Calvin, teaches that a man once justified may fall from that state. Again, the Roman Catholic Church teaches that in all his acts conducive to salvation (*salutaribus*) man is free; in other words, grace imposes on man no necessity.

The Council of Trent in Can. iv. of Sess. VI., thus defines the Roman Catholic doctrine of the freedom of man's will while co-operating with grace: "If one shall say that man's free will, moved and stirred by God, co-operates not, by giving assent to God so inciting and calling, toward disposing and fitting himself for grace of justification; or that he cannot, if he wishes, dissent; but that like some lifeless thing he cannot do anything at all and is wholly passive: be he anathema." The Roman Catholic Church further teaches that the state of grace and holiness in which man was constituted in Paradise was supernatural, something added to the perfection of his human nature; in contradiction to those who teach that this state was in the same sense natural to him as any of his mental or bodily faculties. In consistency with this view such teachers hold that in his fall Adam lost all power and faculty for doing any good act, and that whatever he did was sin.

Graces (Greek, *Charites,* translated by the Romans *Gratiæ*), the goddesses of grace, from whom, according to Pindar, comes everything beautiful and agreeable, through whom alone man becomes wise and glorious. According to Hesiod, and most poets and mythologists, Zeus was their father, and Eurynome their mother. Hesiod gives them the names of *Aglaia* (brilliancy), *Thalia* (the blooming), and *Euphrosyne* (mirth). Homer mentions them in the 'Iliad' as handmaids of Hera (Juno), but in the 'Odyssey' as those of Aphrodite. He conceived them as forming a numerous troop of attendant goddesses, whose office it was to render happy the days of the immortals. Later poets considered them as allegorical images. They not only improve corporeal charms, they have an influence also upon music, eloquence, poetry, and other arts; and the execution of acts of benevolence and gratitude is likewise superintended by them. In the earliest times the statues of the Graces represented clothed forms; at a later period they were represented as nude. They had many temples in Greece, partly dedicated to them alone, partly in common with other deities, particularly Aphrodite, the Muses, Eros, Hermes, and Apollo. Their festivals were called in Greece Charisia. It was customary to swear by the Graces, and libations of wine were offered them at meals. The most celebrated Graces of modern sculpture are those of Canova and Thorwaldsen.

Gradientia, grā-dĭ-ĕn'shĭ-a. See Urodela.

Gradual (Lat. *Graduale*), in the liturgy of the Roman Catholic Church, an antiphon which is sung by the choir or recited by the celebrant of the Mass, immediately after the intoning or the reading of the Epistle (first lesson). The gradual nearly always consists of two or three verses from the Psalms, suggestive of thoughts pertinent to the office of the day. Thus the gradual for the festival of Holy Innocents (28 December) is from the 123d Psalm (in the English Bible 124th): "Our soul is escaped even as a bird out of the snare of the fowler: the snare is broken and we are delivered; our help standeth in the name of the Lord who made heaven and earth." *Graduale* or *Liber Gradualis* is also the name of a service-book of the Latin Church's liturgy: it takes its name from the gradual as just explained, and contains all the graduals for the Sundays and festivals of the entire year, for the use of the choir.

Graduation Act, of 4 Aug. 1854, "An Act to Gradually Reduce the Price of the Public Lands to Actual Settlers." All public lands which had been in the market for 10 years and upward prior to the passage of the act were to be sold for $1 per acre; all 15 years, 75 cents; all 20 years, 50 cents; all 25 years, 25 cents; all 30 years, 12½ cents — except United States reservations, grants to States for railroad purposes, or mineral lands held at over $1.25 per acre. No one was to have over 320 acres including lands previously taken up.

Gra'dy, Henry Woodfin, American journalist and orator: b. Athens, Ga., 24 May 1850; d. Atlanta, Ga., 23 Dec. 1889. He was graduated from the University of Georgia in 1868, studied at the University of Virginia in 1868–70, began his journalistic career with contributions to the Atlanta *Constitution,* and for that journal in 1870 described a press tour of Georgia and the resources and possibilities of the State. At Rome, Ga., he edited the *Courier,* and later established and edited the unsuccessful *Daily Commercial.* In 1871 he became Georgia correspondent of the New York *Herald,* and in the same year purchased an interest in the *Herald* of Atlanta, publication of which was suspended in 1876. He then established the *Courier,* which did not long continue, and in 1880 bought a quarter interest in the *Constitution,* of which paper he remained until his death editor and part owner. He was an able journalist, writing for the New York *Herald* some noteworthy letters, including an account of the Hamburg riots in South Carolina; and while editor of the *Constitution,* publishing in its columns vivid descriptions of the Charleston earthquake, and in various magazines articles on the condition and promise of the South. He also became locally known for his oratory, largely through his lecture, 'Just Human,' given at Atlanta. In 1886, at the annual banquet of the New England Society in New York, he made a distinguished address on 'The New South,' which was widely printed and at once gave him a national prominence. Other well-known speeches by him were one on prohibition at Atlanta in 1887, one at the Texas State Fair in Dallas in 1888, and his final and greatest effort, 'The Future of the

HENRY WOODFIN GRADY.

Negro' (December 1889), before the Merchants' Association of Boston. Grady was the first to present to the North the views of the more enlightened portion of the reconstructed South,— its belief that the "struggle between the States was war and not rebellion," but at the same time its readiness to identify itself with the united progress of the nation. His eloquent services in this behalf were of much importance. He aided in the establishment of the Confederate Veterans' Home, the election of Gen. J. B. Gordon as governor of the State, and the organization of the Atlanta expositions of 1887 and 1889. He declined public office, but was frequently mentioned for nomination to the United States Senate. Consult the 'Life,' by Lee (1896).

Graebner, grĕb'nėr, **August L.,** American Lutheran theologian: b. Frankentrost, Mich., 10 July 1849. He studied at Concordia College (Ft. Wayne, Ind.) and the Concordia Theological Seminary (St. Louis, Mo.), was ordained to the Lutheran ministry in 1878, and was professor of theology in the Lutheran Theological Seminary from 1878–87. In 1887 he became professor of theology in Concordia College (St. Louis). His writings include theological works in German; and in English: 'Life of Luther' (1883); 'Life of John Sebastian Bach' (1885); 'Outlines of Doctrinal Theology' (1898); and other volumes.

Graffiti, grăf-fē'tē, the name given by archæologists to the rude designs and inscriptions of popular origin drawn or engraved with the style upon the walls of ancient towns and buildings, particularly of Rome and Pompeii. Many of these are valuable for the light they throw on popular habits and modes of thought, and the illustrations they often in consequence afford of ancient authors. Graffiti have been found in Greece and Egypt. Some are traced with chalk or plaster, but the majority are scratched on stone or plaster with the stilus, which helps to account for their preservation. Those in Pompeii are found in the Latin, Greek, and Oscan languages, showing that the ancient language of Campania was still extant among a portion of the populace. The inscriptions are most frequently amatory or humorous, sometimes malicious or obscene. In Rome they occur frequently in the catacombs, particularly of Sta. Agnese and San Calisto. Many of these are by Christians, some by Pagans, in ridicule of Christianity. See GRAPHITOLOGY.

Graft'age, the process and practice (origin unknown) of propagating plants by the insertion in one of a bud (stock) or twig (scion) of another. It also includes the discussion of all questions relating thereto. The stock may be a complete plant, as in peach budding, or only a part, in which case it may be either a root or a stem part. In some instances (inarching, see below) both plants may have roots. Since the process is dependent upon the coalescence of the cambium (q.v.) of stock and scion the first essential is to make these two surfaces abut; the second is to check evaporation from the cut surfaces.

The many scores of styles of graftage fall naturally into three main groups:

1. *Inarching,* or *grafting* by *approach,* the uniting of two plants before the severance of the scion from the plant upon which it grows. After union the scion is severed below the point of contact and the parts of the stock above this point are removed. The method is rarely practised except with subjects hard to graft by more popular methods and for correcting defects of form, such as Y-crotches in fruit trees, a living brace being formed between the two arms. Since it is the only graftage found in nature, it is supposed to be the progenitor of modern methods.

2. *Budding* or *bud-grafting,* the inserting of a single bud beneath the bark of the stock or in some cases (for example, annular or ring budding) in the place of a piece of bark removed. It is always practised upon small stocks preferably under two years old and always when the bark readily separates from the wood as in spring or late summer. Since spring is a very busy season in nurseries, budding is practically all done during summer. The universally popular method is the shield, so-called from the shape of the scion. It is practically the only method employed in propagating the stone fruits — peaches, plums, etc. The seedling stocks, which are usually not less than one fourth inch in diameter, are stripped of their leaves close to the ground, are cut through the bark twice on the shady side, the cuts forming a T, the bark lifted gently with the specially formed ivory knife-handle, and the bud inserted and tied with raffia, bast, or cotton. A small portion of the bark and a little of the leaf stalk accompany the bud, the latter to act as a handle. In about two weeks, if the bud has taken, the binding is cut on the side opposite the bud to prevent "strangulation." In case of a failure other attempts are made. No visible growth occurs during that season, but in the spring the bud should become a shoot and the original top of the seedling stock should then be cut a few inches above the union, and later, when the union is firm this stub is cut off short. At the close of that season the tree is ready for sale.

3. *Grafting proper,* the inserting of a twig into a stock. The methods under this heading may be divided according to the maturity of the scion whether dormant or growing, and also as to the position the graft occupies, whether upon the root, the crown, the stem or the branches. By far the largest amount of grafting is done with dormant wood, and probably upon roots, though grafting upon the branches is widely popular. In *whip-grafting,* which is the one most practised with roots, especially in the nursery propagation of apples and pears and performed in early winter, the seedling roots are specially grown and are as nearly the size of the scions as possible. Both stock and scion are formed alike, two cuts being made, one rather long, diagonally across, and the other parallel with the direction of growth, thus forming a sort of tongue. The tongue of each is then fitted into the slot of the other, the pieces wrapped with waxed string, and stored in a moist, cool place until spring, when they are planted in the nursery. Usually they are sold after two seasons' growth.

Cleft-grafting is most frequently used upon parts of trees above ground or with grapes just below the surface. The stock is sawed across at right angles to the direction of growth, split

with a knife and held open with a wedge until the twigs (scions) bearing two or three buds and whittled to a wedge form below are inserted, one at each end of the slit. The wedge is then removed and the wounded surfaces waxed. This method is practised most upon stocks too large for whip-grafting, limbs even as large as three inches in diameter being sometimes used. As a rule small stocks give more satisfactory results. The method is universally employed to change long-established trees to other varieties.

Some other frequently employed methods are: (1) *Bridge-grafting*, which is used for saving young trees that have been girdled by mice or rabbits or otherwise deprived of their bark. The edges of the injured surface are trimmed above and below, and scions, with wedge-shaped ends, are fitted beneath the bark at each of these points. The whole is then covered with wax. Any sprouts that appear are rubbed off so as to force all growth into the stem. The scions soon unite upon their sides as well as to the original trunk. (2) *Veneer-grafting*, which is widely used in greenhouses, consists in inserting a scion upon the side of the stock, binding and protecting it from the air. The method is practised with both ripened and immature wood.

Protection from the air is gained in budding by bringing the bark of the stock in close contact with the scion and by bandages; in grafting, by applying a bunch of damp moss (a greenhouse practice) or covering of grafting wax, grafting clay, etc. (outdoor practice). One of the most popular waxes is made as follows: Melt and thoroughly mix together 3 pounds of mutton tallow, 5 of beeswax, and 10 of resin; pour into cold water and work with the hands until the color of pulled molasses taffy. Apply closely while warm enough to spread readily by pressure of the hand. For use in *whip-grafting* balls of woolen yarn are soaked in melted wax and wound around the grafts. Soft waxes are less useful, since they are likely to melt on warm days and in warm climates. No horticultural practice except that of cuttage can compare with graftage in extent of usage and apparent necessity. Like cuttage, its strong points are ease and certainty of operation, maintenance of a variety "true to type" with the comparatively rare exceptions of bud variation, and the modifications which it permits in the habits of plants. Some of the more important of these last are dwarfing, produced by grafting a strong growing scion upon a small growing stock, as pear upon quince; hastening or increasing fruitfulness, as when scions from bearing wood are top-grafted or budded upon young established trees already in the orchard; to counteract injuries (see *bridge-grafting* above); to change poor or unproductive trees into useful ones (see *cleft-grafting* above); to make possible the growing of certain trees upon uncongenial soils, as peaches budded upon plum stocks for heavy soils and plums upon peach stocks for light soils, etc.

Much popular misconception exists as to the limits of grafting. In many instances the possibilities have been found wholly within the individual species; that is, various different but related species fail to unite and grow. Generally, however, the limits are within the genus; for example, plums, peaches, cherries, apricots, etc., readily thrive upon one another. Again there are a few instances of different genera which unite, as among cacti. Genera are, however, arbitrary, man-made groups. Permanent unions between oaks and roses, grapes, and pears, and similar widely separated plants have not been reported by reputable horticulturists. Consult: Bailey, 'Cyclopedia of American Horticulture' (New York 1900–2); id., 'Nursery Book' (id. 1896); Fuller, 'Propagation of Plants' (id. 1887); Baltet, 'L'Art de Greffer,' and its English translation, 'Budding and Grafting.'

Grafton, Charles Chapman, American Protestant Episcopal bishop: b. Boston 12 April 1830. After a course in law at Harvard, he studied divinity and was ordained priest in 1858. He was rector of the Church of the Advent, Boston, 1872–88, and in 1889 was consecrated bishop of Fond du Lac. His writings include 'Plain Suggestions for a Reverent Celebration of the Holy Communion.'

Grafton, Mass., town in Worcester County; on the New York, N. H. & H., and the Boston & A. R.R.'s; about 6 miles southeast of Worcester and 9 miles northwest of Milford. In 1728 the first permanent white settlement was made, and the town was incorporated in 1735. As early as 1660 John Eliot (q.v.) established here a settlement of Indians whom he had converted. The manufactures are cotton goods, threads, boxes, boots and shoes, emery, and underclothing. Pop. (1900) 4,869.

Grafton, N. Dak., city, county-seat of Walsh County; on the Park River, the Great N., and the Northern P. R.R.'s; 15 miles west of the Red River of the North. It is in the great wheat region, and is the trade centre of Walsh County. It has grain elevators, flour-mills, and cattle-yards, and manufactures farming implements. It is the seat of the State Institute for the Feebleminded. Pop. (1900) 2,378.

Grafton, W. Va., city and county-seat of Taylor County, located in the northern part of the State, 100 miles southeast of Wheeling, and on the Tygart Valley River, and the Baltimore & O. R.R. The city is the terminus of four branches of the Baltimore and O. R.R., and owes its importance to the establishment of the Baltimore & O. R.R. machine shops. It also has flour and planing mills, a wooden pump factory, foundries, cigar and glass factories, and is also engaged in mining and agriculture. There are eight churches, public and parochial schools, and five banks, with a combined capital of $310,000, and there are two weekly papers published. A national cemetery is within the city limits containing 1,261 graves, 600 of which are nameless. Municipal affairs are administered by a mayor and council of eight members, elected for two years. The city owns its waterworks and electric lighting plant. It was founded in 1854, incorporated in 1856, and received its charter as a city in 1899. The population are mainly English and German. Pop. (1900) 5,650.

A. J. Wilkinson.

Graham, grā'am, **Charles Kinnaird,** American civil engineer: b. New York 3 June 1824; d. Lakewood, N. J., 15 April 1889. He entered the navy in 1841, during the Mexican war served with the Gulf squadron, after study of engineering was appointed constructing engineer of the Brooklyn navy-yard, whose great dry-dock and

landing-ways were built by him. At the outbreak of the Civil War he volunteered in the Federal army, and during the War he was twice wounded at Gettysburg and there taken prisoner; commanded the gunboat flotilla in Gen. Butler's expedition up the James River, and was brevetted major-general of volunteers (1865). He was successively chief-engineer of the New York dock department in 1873-5, surveyor of the port in 1878-83, and naval officer in 1883-5.

Graham, Isabella (Marshall), American educator and philanthropist: b. Lanarkshire, Scotland, 29 July 1742; d. New York 27 July 1814. From 1774 she was a teacher in Scotland, where, in Edinburgh, she inaugurated the work which led to the organization of the Society for the Relief of the Destitute Sick. In 1789 she removed to New York, and there for several years conducted a successful school. Her philanthropies were many, and were particularly in the interests of education, religious and secular. She founded in 1814 the Society for the Promotion of Industry Among the Poor.

Graham, James Duncan, American topographical engineer: b. Prince William County, Va., 4 April 1799; d. Boston 28 Dec. 1865. Graduated from the United States Military Academy in 1817, he entered the corps of topographical engineers, in which he attained major's rank in 1838, was astronomer to the survey which determined the boundary line between the United States and the republic of Texas (1839-40), and later United States astronomer in the joint survey of the boundary between the United States and the British provinces. In the determination also of the boundary between the United States and Mexico he held a similar post. Subsequently he directed harbor improvements in the lakes of the North and Northwest, in which he was the first to detect the presence of a lunar tide, and was superintending engineer of the Boston harbor sea-walls and of repairs in various harbor-works along the Atlantic coast.

Graham, John, Viscount Dundee, commonly called Claverhouse, Scottish commander: b. near Dundee, Scotland; d. Killiecrankie 17 July 1689. He went abroad and entered the service, first of France and afterward of Holland, but returned to Scotland in 1677, where he was appointed captain of a troop of horse raised to enforce compliance with the establishment of Episcopacy. He distinguished himself by an unscrupulous zeal in this service, and waged an exterminating war against conventicles. The Covenanters were driven to resistance, and a body of them defeated Claverhouse at Drumclog on 1 June 1679. The Duke of Monmouth, however, defeated the insurgents at Bothwell Brig on 22 June, and Claverhouse was then sent into the west of Scotland with absolute power, and exercised it in such a manner as to lead to the belief that in addition to the persecuting policy of his superiors he was actuated by personal revenge. The more terrible he made himself to the Covenanters the more acceptable his career was to the government. In November 1688, after William had landed, he received from James in London the titles of Lord Graham of Claverhouse and Viscount Dundee. When the king fled he retired to the north, followed, by order of the Convention, by Gen. Mackay. Claverhouse was joined by some of the Highland chiefs occupying Perth, and finally encountered Mackay in the pass of Killiecrankie, whom he defeated, but was killed in the battle. Attempts have been made by Sir Walter Scott and others to throw a halo of sentimentality and heroism around his character; but it is clear that he was the willing instrument of a cruel government, and had himself little sentiment or softness in his nature. See Napier, 'Memorials and Letters of John Graham of Claverhouse' (1859-62); Mowbray Morris, 'Claverhouse' (1887).

Graham, Sylvester, American reformer: b. Suffield, Conn., 1794; d. 1851. He studied at Amherst College, was ordained to the ministry of the Presbyterian Church about 1826, and became known as a lecturer on temperance and dietetics. His proposed cure for alcoholism was based upon a vegetarian diet. The article of food made of unsifted wheat flour and known as Graham bread was introduced by him into general use. His writings include: 'Bread and Bread-Making,' and the 'Graham Lectures on the Science of Human Life' (1839).

Graham, Thomas, D.C.L., Scottish chemist: b. Glasgow 21 Dec. 1805; d. London 16 Sept. 1869. He was educated at the University of Glasgow, and in 1828 communicated to the Royal Society of Edinburgh the results of experiments on the absorption of vapors by liquids. In 1831 he laid before the Royal Society of Edinburgh the result of a series of experiments on 10 different gases, from which he arrived at the conclusion that gases tend to diffuse inversely as the square root of their specific gravities, a conclusion which has been received as the law of the diffusion of gases. In 1837 he was elected professor of chemistry in the University of London, and soon afterward was appointed assayer to the mint. In 1840 he received the gold medal of the Royal Society, and the next year was chosen first president of the Chemical Society, which he had assisted in founding. He now began to be employed as consulting chemist in various mercantile and public undertakings, and it was by his recommendation that wood-spirit, or methylic alcohol, was used to render spirits sold free of duty for trade or scientific purposes unfit for consumption as a beverage. In 1846 he assisted in founding the Cavendish Society, of which he was elected president, an office he retained till the close of his life. At the same time he was engaged in investigations on the diffusion of liquids, and was the earliest to fully develop that theory. He made many other important discoveries, and was the author of 'Elements of Chemistry' (1837) and various professional papers.

Graham, William Alexander, American politician: b. Lincoln County, N. C., 5 Sept. 1804; d. Saratoga Springs, N. Y., 11 Aug. 1875. He was graduated from the University of North Carolina in 1824, was admitted to the bar in 1826, and entered practice at Hillsboro. From 1833 he was repeatedly elected to the House of Commons, of which in 1839-40 he was speaker. In 1840-3 he was in the United States Senate, in 1844 and 1846 was elected Whig governor of North Carolina, declined a third term, and in 1850-2 was secretary of the navy, in which capacity he organized Perry's expedition to Japan. Though at first opposed to secession, he later identified his fortunes with those of

his State, and in 1864 took his seat in the Senate of the Confederacy. Subsequent to the war he was an executor of the Peabody fund for the promotion of education in the South, and a member of the commission for settlement of the undetermined boundary line between Virginia and Maryland.

Graham Land, a tract of land in the Antarctic; discovered in 1832 by Bisco, master of a British sealer. In 1894 Larsen, a Norwegian, reported the discovery of a continent, one portion of which he named King Oscar II. Land and another part Foyne Land. Both proved to be on the coast of Graham Land. The Belgian expedition of 1897–8 explored the west coast, and gave it the name of Palmer Land, in honor of Nathan Palmer, an American sealer, who discovered this coast in 1818. Capt. James Cook (q.v.) reported, in 1774, finding land in the Antarctic, but not a continent.

Grail, The Holy. The cup or bowl from which Christ drank at the Last Supper. The history of the grail as given in most romances is substantially as follows: After the Last Supper the cup came into the possession of Joseph of Arimathea, who caught in it some of the blood that flowed from the wounds of the crucified Saviour. Being miraculously conveyed to England to escape persecution, he carried the precious vessel with him. Throughout his life it furnished him with food and drink, and with spiritual sustenance as well; and at his death he charged his successor to guard it faithfully. It was handed down from generation to generation, the Fisher King being a descendant of Joseph. This vessel is the grail. According to other versions, the grail chooses its own knights. It possesses miraculous properties, and at times is instinct with divine life. To discover its abiding-place and become one of its guardians is the ambition of good and valiant men, but only the pure in heart may find it. One form of the legend represents three of Arthur's knights, Galahad, Perceval, and Bors, as being blessed with a sight of the holy relic. Galahad is said to have had it in his possession, who at his death transferred it to Perceval, and after the death of the latter the cup was taken up into heaven. Students of folk-lore connect Perceval of the Christian legend with the Siegfried of early German literature and Celtic mythology, but the account of a sacred spear and bowl, as given in the grail romances, appears to be mainly of Christian legendary origin, and to be based upon the lives of saints and certain apocryphal books of the New Testament, principally the Gospel of Nicodemus. It is probable that the Perceval story was familiar, in one or more of its many different forms, to the people of western Britain, before their conversion to Christianity. When the French romancers of the 12th century began to develop the grail idea,— the idea of a sacramental symbol, dwelling among men but discoverable only by the brave and pure,— they wove into their narrations tales of chivalry, mysterious adventures, and legends of folk-lore. Chrestien de Troyes, who was possibly the first writer from whom a grail romance has come down to us, was evidently intending to fuse certain elements of the grail and Perceval legends. He began his work about 1189, but died without completing it. Chrestien's poem was taken up by several other French writers after his death. An introduction was fitted to it, in which a violent attempt was made to reconcile the Christian and heathen elements. Many thousands of lines were also added, by various hands, in the early years of the 13th century. Meanwhile, probably before the end of the 12th century, Robert de Borron had written, in Old French verse, a trilogy, 'Joseph,' 'Merlin,' 'Perceval,' of which the 'Joseph' and part of the 'Merlin' have been preserved. It was he especially who gave to all the material a Christian character. There are also later prose adaptations of his work. Great difficulty is occasioned by our ignorance of where to place the French prose romance, the 'Queste del Saint Graal,' generally attributed to Walter Map, or Mapes, and another, the 'Grand Saint Graal,' often accredited to Borron. In these the Christian symbolizing tendency is strong, and the story of Perceval is buried under many complicated tales of knight-errantry. They were, however, probably written before 1204. The 'Queste' having been one of the romances followed by Malory in his 'Morte Arthure,' the Galahad story has had a marked influence upon later literature. There are several other members of the early cycle of grail romances, but only one is of great importance,— the 'Parzival' of Wolfram von Eschenbach. The 'Parzival' is his *magnum opus*. It is also the finest narrative poem of which the authorship is known, between the era of classical antiquity and the 'Divine Comedy' of Dante. Furthermore, it is the most complete, and virtually the final, mediæval handling of the two great themes which are involved in the legend of the holy grail, and which Wolfram more thoroughly blends than any other poet.

During the next 250 years it was the mission of the legend of the holy grail to be the spiritualizing tributary of a broader stream of literature, the full current of Arthurian romance. It then remained in obscurity until the 19th century. Modern English and German poets in reviving the story of the grail, have been moved by the same moral earnestness as Wolfram von Eschenbach, and by the same desire to show the way to seekers after the spiritual life. The best-known of the many modern embodiments of this legend are Tennyson's 'Holy Grail' and the text of Wagner's musical drama 'Parsifal.'

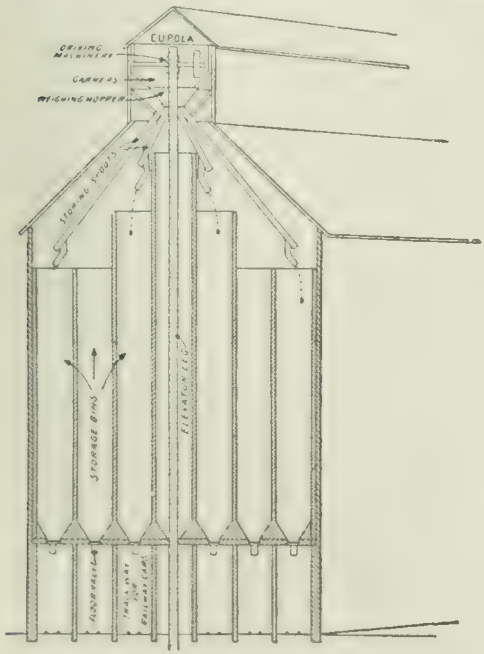
Grain, any cereal cultivated on account of its seed for the production of meal or flour. All kinds of grain contain nutritious particles of a similar character, although they vary, both in their quantity and in their mixture, in various grains. These elements are: (1) Gluten, which affords the strongest nourishment for the animal body. (2) Fecula or starch, which is very nutritious, although not so much so as gluten, which, however, it seems to render more di-

gestible. (3) A sweet mucilage, which is more nutritious than starch, but is small in quantity, and renders the grain liable to the vinous and acetous fermentation. (4) A digestible, aromatic substance contained in the hulls, which consist of a fibrous matter. (5) Moisture, which is predominant even in the driest grain, and increases the weight of the mass, although it lessens the specific gravity; it affords no nourishment, hastens the decomposition of all kinds of grain, if they are not kept very dry, and influences germination. See articles under names of different cereals.

Grain Elevator, a structure equipped with elevating machinery for the purpose of loading, storing, and cleaning grain which is subsequently unloaded directly into railway cars, canal boats, or grain-carrying vessels for transportation.

It consists of a rectangular building or "house," surmounted by a smaller structure called the "cupola." The house is divided into a series of deep storage bins, while the cupola contains the machinery for operating the "elevator leg," the turnhead spouts, the garners, the weighing machines, and the cleaning machinery. It is usually constructed of timber with brick outside walls for the house, and corrugated sheet iron for the roof and walls



Sectional Diagram of Grain Elevator.

of the cupola. Many elevators, practically fireproof, are built with solid brick walls enclosing steel bins surmounted by steel framed cupolas roofed with terra-cotta or sheet iron, while the bins of some of the European structures are made of steel skeletons embedded in concrete. In the United States further protection is obtained by housing the steel storage bins and the operating machinery in separate fireproof buildings, the grain being handled between them by a system of pneumatic conveyors.

The elevator leg consists of a framing the foot of which extends below the floors of the bins, while its head reaches to the topmost story of the cupola. Within this framing a belt conveyor, made up of several thicknesses of canvas and sheet rubber, usually 36 inches wide and three quarters of an inch thick, is operated by steam power. The belt, which is of the endless type and carries a series of metallic buckets, passes over two pulleys, one at the foot and the other at the head of the leg and lifts the grain to the turnhead spouts in the cupola.

Unloading and storing is accomplished as follows: The grain-laden cars are usually run up along the side of the building so that each car is placed directly under an elevator leg. Two men in each car, operating shovels by ropes from a steam-driven shovel shaft, shovel the grain into the pits of the elevator leg, and thus fill the buckets of the conveyor, which, operating continuously, carries it up to the cupola, where the buckets are tipped over automatically and their contents discharged into the turnhead spouts. From these the grain passes by gravity into the garners, thence into the hoppers of the weighing machines, which are usually gauged exactly for 100 pounds, thence to the cleaners if desirable, and finally through a system of spouts to the storage bins.

When used for unloading grain from ships to railway cars the elevator legs are placed outside the house and their feet lowered into the hold of the vessel through the hatchways. The conveyors carry the grain to the turnhead spouts from which it passes to the storage bins, and thence through the floor valves of the bins to the cars placed beneath them. Under such conditions they are called "marine elevators," and when the arrangement is mounted on a barge or float to permit of its being moved from place to place, it is commonly known as a "floating elevator."

To unload grain from an elevator into the grain-carrying vessels of the Great Lakes, the vessel is made fast alongside of the house, and its hatches being removed, the grain is poured by gravity in a perfect torrent into its hold through great spouts which extend to the hatchways from the floor valves of the bins. The discharging capacity of these spouts ranges from 12,000 to 60,000 bushels per hour, and load vessels of the greatest capacity in two or three hours.

The loading and storing capacities of individual elevators vary greatly according to their location. Innumerable small structures capable of handling only a few thousands of bushels each are located along the lines of railway traversing the grain-bearing regions of the Western States; but those at the large centres of flour manufacture and grain transportation, such as Minneapolis, Duluth, and Chicago, are of mammoth proportions, with individual capacities ranging from 500,000 to 5,000,000 bushels. One of the medium sized elevators at Duluth is 285 feet long, 85 feet wide, and 150 feet high. Nine belt conveyors driven by a 200 horse-power steam engine lift the grain to a height of 145 feet to the turnhead spouts. Each belt carries 125 buckets having a capacity of one peck each, so that the total load at any working instant is about 270 bushels or 15,000 pounds, representing an unloading capacity of 12,000 bushels per

hour. The storage bins are each 60 feet deep by 20 x 10 feet cross section, with a capacity of 12,000 cubic feet, thus giving the elevator a total storing capacity of 1,500,000 bushels.

The cost and rendering of elevator service is fixed and regulated by different conditions in the different States. In Illinois the elevators are compelled to receive and store, up to their full capacity and without discrimination, all the grain brought to them for that purpose, provided it is free from disease or other impurities. The maximum charge allowed for this service is 1¼ cents per bushel for the first 10 days or any portion thereof, and ½ cent per bushel for each subsequent 10-day interval. The elevators at each of the three cities mentioned have a total capacity of about 35,000,000 bushels, and each group handles about 70,000,000 bushels of grain annually.

William Morey, Jr., C.E.,
Consulting Civil and Mechanical Engineer, New York City.

Grain, Handling and Transportation of. The methods of handling the grain produced in the Northwest, the various stages through which it passes from the field to the consumer, the means and appliances employed and incidentally the volume of grain handled, and the cost and method of transportation are important factors in the agricultural development of the Great West.

The States of Minnesota and the Dakotas are the spring wheat States, producing the bulk of that incomparable variety in the United States. The process of seeding and harvesting is much the same with the small farmer with his 160 acres as the large one with his thousands of acres. Both use similar machinery, differing only in the amount used. It is a self-evident fact that in the production of grain and the manufacture of flour, as well as in all other manufacturing industries, the profit depends in a very large degree upon the volume of business done. The tendency in all lines has been to cheapen the cost by increasing the volume.

Minnesota and the Dakotas produce a yearly average of 133,000,000 bushels of wheat, 55,000,000 bushels of corn, 87,000,000 bushels of oats, 1,600,000 bushels of rye, and 22,000,000 bushels of barley. At most towns in these spring wheat States, along the lines of railroads are small elevators, to which the farmer takes his grain either to sell, store, or ship, according to his inclination or ability. These elevators receive the grain for storage or for shipment to the primary or semi-terminal elevators at Minneapolis or Duluth. Well-informed farmers and dealers estimate the cost of production of a bushel of wheat to be from 40 to 45 cents. The average cost of transferring the grain from the farm or initial point of shipment to either Minneapolis or Duluth (rates being about the same) is about 10 cents per bushel. The charges for storing grain at these points are about three fourths of a cent per bushel for the first 15 days, including cleaning.

The average yearly receipts of wheat in round numbers at Minneapolis for the last 12 years were 73,000,000 bushels, of which about 54,000,000 bushels were manufactured into flour. The elevator capacity at Minneapolis is 36,000,000 bushels.

State Inspection.— In Minnesota the State inspection of grain is accomplished by well-qualified men having a technical knowledge of their work and experienced as well, under rules prescribed by the State Board of Appeals. The board of inspection is composed of six members, three of whom are located at Minneapolis and three at Duluth. If the inspector's report is not satisfactory to the buyer or seller, the aggrieved party can appeal to the Appeal Board, whose decision is final. The mode of inspection is as follows: The first step of the inspector is to go with the sealer, who opens the car, breaking the railroad seal for the inspector, who enters the car, and takes several samples of grain by probing to the bottom of a car in several places with an instrument provided for that purpose. From these samples he mixes and makes a general sample, from which his report as to grade under the rules is made. The car is then resealed with a State seal, the railroad seal number and the seal number substituted by the State having been duly recorded by the sealer.

Weighing.— After the cars of grain have been transferred to the elevators, the grain doors are removed, which allows the grain to fall into pits under the cars. The assistant weighers take the number and initial of the car, see that no grain is left in the car and that the shipment has been elevated to the scale floor at the top of the elevator. The grain is then carefully weighed and distributed to the different storage bins of the elevator and, after cleaning, is ready for shipment eastward. The charge for inspecting and weighing a car of grain is 50 cents. The record of every car inspected and weighed is carefully preserved by the two departments, each of which gives to every owner or agent a certificate of grade and weight. These certificates form the basis of settlement of the consignor with the consignee, the freight bills of the railroad companies and supply the necessary information to the grain registrar, whose duties will be more clearly defined hereafter. The State employs a scale expert, whose duty it is to examine and test the scales used at Minneapolis and Duluth, to see that they are in perfect condition at all times.

Grain Registration.— In those elevators termed regular, under the rules of the exchanges at Minneapolis and Duluth, great care is used to prevent any irregularities as to grade and quantity. After the grain has been inspected and weighed as before described, and the elevators have reported to the State registrar, he issues certificates which show the name of the elevator, the date the grain was received, the number and initial of the car, the number of bushels and the grade. These receipts must be returned to the registrar and canceled before the grain can be shipped. The registered receipts are mainly used as collateral upon which to obtain money at the banks, and are considered and approximate as nearly to perfect securities as any found in the West. Many years of experience have proven that this standard of securities has been very high and safe.

Duluth as a Semi-terminal Point.— Duluth is a primary or semi-terminal market, the same as Minneapolis. The system of inspection, weighing and registration is identically the same; but Duluth, being the point where rails and water meet, and being Minnesota's only lake port, the method of shipment of grain is different from that at Minneapolis. The elevator capacity at

Duluth is 34,000,000 bushels, the average receipts of wheat for past 12 years being in round numbers 62,000,000 bushels, of which some 8,000,000 bushels are manufactured into flour at the Duluth-Superior mills. The balance is mostly consumed in eastern markets, although some years a million bushels have been exported.

Water Transportation.— On the Great Lakes large steel freighters carry the products of the prairie farms of the West at greater reduced cost than in years past. The evolution is from the little 100-ton steam-barge of 30 years ago to the 10,000-ton steamer of to-day, and it frequently happens that vessels loading at the elevators at the head of the Lakes, take at one load all the grain grown on a whole township of land.

The question of cheap transportation eastward of the varied and enormous products of the Northwest has been the subject of congressional legislation for many years; and that it was wisely considered by that body is evidenced by the governmental appropriations of over $10,000,000 since 1881 for the purpose of building locks, widening and deepening canals and improving the channel through the river at Sault Ste. Marie. That the full benefit of the improvements at the "Soo" be fully realized to the end that vessels might load to their full capacity, an appropriation was made a few years ago of $3,130,000 for deepening the channels in the joint harbor of Duluth and Superior, to 20 feet, thus enabling vessels trading between Duluth and Buffalo to load to that depth. The benefit of this is shown by the fact that the average size of vessels trading at the head of Lake Superior has grown from 336 tons in 1885 to 1,940 tons in 1902. With economy in production by the aid of improved labor-saving machinery, and larger and better vessels operated at less sums proportionately, it is no wonder that the cost of seeding and harvesting the grain and transporting it to the seaboard has been reduced to the minimum.

Loss in Transit.— The average loss per 1,000 bushels of wheat in transfer from Duluth or Chicago to Buffalo in 1902 was 14 pounds, or about one peck for each 1,000 bushels, showing that the weighing of grain by the large elevators has been reduced to a science. Quick despatch at the Duluth elevators during the season of large receipts is proverbial and it is frequently the case that some of these large vessels load at the rate of 60,000 bushels per hour. The average freight rates on grain from Duluth to Buffalo for the last six years has been 22 mills per bushel. From Buffalo to New York the rates for the same period have averaged about three and one third cents.

With closer trade relations with Canada by removing the duty on wheat, the amount of grain that would find its way east via the Great Lakes would be greatly augmented. About 75 per cent of the grain going east by water from Duluth, goes to Buffalo, 11 per cent to Chicago and Lake Erie ports, and 14 per cent to Canadian ports.

H. B. Moore,
Secretary Duluth Board of Trade.

Grain Insects. Stored grain, corn, nuts, and the like, are frequently infested and injured by various insects. About 40 kinds of weevils (q.v.) lay their eggs upon dry grain, and their grubs bore into and devour the kernel, so that when they are numerous great damage may ensue. It has been estimated that the annual loss in the United States from this cause alone is about $40,000,000. The most important of these pests are the granary-weevil (*Calandra granaria*) and the rice-weevil (*C. oryza*). The former is wingless, evidence that it was domesticated ages ago. It multiplies so rapidly, developing from egg to adult in about six weeks, that five or six generations might be produced annually in a warm temperature. The rice-weevil has well-developed wings, which it seldom uses, showing a strong tendency to become wingless in time. Much injury to stored grain is also caused by other beetles, particularly by three species (*Silvanus surinamensis, Cathartus gemellatus* and *C. advena*), but they usually follow the attacks of other insects. The cadelle (*Tenebroides mauritanicus*) is to be included in this category, as it has a pernicious habit of gnawing into kernels of grain and destroying the embryo or germ. Great harm in granaries is done also by small moths related to the clothes-moth, whose caterpillars bind the grains together, forming clots, which both spoil the edible quality of the cereal, and clog mill machinery. The most familiar of these is the European *Sitotroga cerealella,* often called Angoumois grain-moth, but known as "fly-weevil" in the southern States, where it is so prevalent that grain can nowhere be stored for a long time. Another imported grain-moth, troublesome in the United States since about 1890, is *Ephestia kühinella;* and a third (*Tinea granella*), is especially harmful to wheat in Europe, but not prevalent in America. Injury by the Angoumois grain-moth and the rice-weevil, which obtain entrance to the grain in the fields, can be largely prevented by early harvesting and by threshing as soon as possible. The standard remedy for all grain insects, however, is bisulphid of carbon, applied at the rate of one or two ounces to every hundred pounds of infested grain, which is effective in proportion to the tight closing of the bins. Exposure should last as long as possible, unless the seed is desired for planting, when an exposure of 24 hours is sufficient and will not detract from the germinating power. In buildings that cannot be tightly closed a larger quantity of the insecticide must be used, and repetition of treatment is necessary in warm weather at intervals of six weeks or more. Frequent stirring about of the grain is helpful against these insects; and granaries whenever emptied should be thoroughly cleaned and whitewashed. See Flour and Meal Insects.

Grain-poisoning. See Ergotism.

Graining. (1) In leather manufacture, the process of rubbing leather with a board to raise the grain. The leather having been shaved to a thickness at the beam, and daubed, is hung up to dry, and is then folded, grain side in, and rubbed on the flesh side with a pommel or crippler to give the leather a granular appearance and render it supple. The hide is then extended and rubbed on the grain side. This is termed bruising. Also a process for giving markings to the surface of leather to imitate the wrinkled appearance of morocco, hog-skin, and some other leathers.

(2) In painting, the imitation of the natural grain of wood by means of tools. Combs,

brushes, rollers, and the corner of a folded rag are used in making the various patterns.

(3) In lithography, a mode of giving a certain texture to the face of a stone. One stone is laid on another with a quantity of sifted sand of a given fineness, and by a peculiar oscillation and gradual progression the surface is cut into a set of fine prominences more or less deep and distant, according to the character of the work to be placed on the stone.

Grakle, grăk'l, the name of several kinds of birds. In the United States the blackbirds (especially the larger ones) of the family *Icteridæ.* (See BLACKBIRD.) In India and eastward a myna (q.v.) or some related bird formerly classified in the miscellaneous group *Gracula.*

Gramineæ, grā-mĭn'ẹ-ē. See GRASSES.

Grammar, in its widest sense is the science of language, treating of the words of which language is composed, and their mutual relations when combined in a sentence for the expression of thought. Universal grammar is the science of verbal expression throughout all languages; comparative grammar studies the words and grammatical forms of a group of kindred languages — the Aryan group, for example; a particular grammar deals with the words and grammatical forms of a single language. But the study of words, their meanings, their origins and their histories may be regarded as belonging to lexicography rather than to grammar proper: the proper field of grammar would then be the study of the methods by which the relations between words in a sentence and between sentence and sentence are determined. The English language as it exists differs in important respects from the Germanic dialects from which it is sprung: it has lost great part of its native vocabulary and has taken to itself a very considerable portion of the vocabulary of Latin, either direct from that language or through the French. And its mode of expressing the relations between words has been immensely simplified by eliminating the inflexions which in those early dialects were very numerous. The grammatical rules which regulated English speech in the several stages of its development became antiquated as the change proceeded, and now English is less under control of grammatical rules than perhaps any of the other languages of culture.

Here comes into view the important difference which exists between the languages which express by inflexions the mutual relations of words in a sentence, and the languages which indicate those relations merely by the position of the words. English is the type of a language almost without inflexions: Latin is an example of one that abounds in inflexions. English has but one case inflexion of nouns, the s of the possessive case; and an objective case inflexion of pronouns: he, him; they, them; who, whom, etc. As Marsh observes (Lectures on the English Language, 393) this inflected possessive of nouns expresses in modern English almost exclusively the notion of property or appurtenance and applies to persons or to animated creatures; hence we say «a man's hand,» «a horse's hoof,» but not «the house's roof.» Though the Germanic dialects from which English is sprung had inflexions of adjectives, both for gender and number, no trace of them now remains in English. In Latin, nouns, pronouns, adjectives, verbs, all have numerous inflexions to denote all manner of relations between the words of a sentence. An adjective is of the gender of the noun to which it belongs: Good man is *bonus vir,* good girl, *bona puella,* and these two phrases are in the nominative case plural *boni viri, bonæ puellæ.* Declinable parts of speech in Latin have six cases in singular and plural, viz.: nominative, genitive, dative, accusative, vocative, ablative. The verb in English has but two inflections, the d or ed of the past indefinite or præterite, as, sail, sailed, and the participial inflexion ing. But the Latin verb has four modes, indicative, subjunctive, imperative, infinitive, also present and future participles and the two forms called «supines»: all these in the active voice, and all constituting inflexions. The tenses, each with a distinctive inflexion for the three persons and for singular and plural are the present, imperfect, perfect, pluperfect, future, and future-perfect: not all of these tenses run through all the modes. In the passive voice the perfect, pluperfect, and future-perfect are not inflexional.

English being practically uninflected, position in the sentence determines the mutual relations of the words. In the sentence «Titus teaches Julia the letters,» no different arrangement of the words can be made without rendering the whole unintelligible. But convert the sentence into Latin, and in whatsoever order the words be written, the sense is ever the same: «*Titus Juliam literas docet,*» or «*Literas Juliam docet Titus,*» etc. Again, «Proteus drove his flock to view the high mountains» (mountain tops) — *Proteus pecus egit altos visere montes;* no change of position of the words affects the sense. In passing it may be noted that Horace's phrase, «*pecus egit visere,*» drove (his) flock to see, is in Latin a poetical license, and in prose the idea would be differently expressed: but the phrase in English is grammatically correct both for prose and poetry.

English knows nothing of grammatical gender: in other languages grammatical gender attaches to all nouns, whether distinguished by sex or not. The modern Latinish languages, French, Spanish, and Italian, attribute gender, masculine or feminine, to all nouns; but Latin has also a neuter gender. In Latin *domus* (house) is feminine, *murus* (wall) masculine, *jumentum* (beast of burden) neuter; and of course adjectives qualifying such nouns must agree with them in gender. In English there is a tendency even toward eliminating nouns feminine which designate women as engaged in sundry employments — that of instruction, authorship, etc., and to substitute for instructress, authoress, etc., instructor, author, doctor; so, too, women are masters of arts, bachelors of arts, etc.

The subjunctive mode of verbs in English has gone almost quite out of use. In Latin the subjunctive form possessed very great importance in defining with precision a writer's or a speaker's meaning. A notable peculiarity of English grammar is that it permits a word to serve both as noun and adjective, as when we say a sword thrust, a marble building: such phrases would be rendered into Latin by *gladii ictus* (thrust of sword), *ædificium marmoreum;* rendered literally, they would be unintelligible.

Equally peculiar to the grammar of English is the use of nouns as verbs, as "to shovel snow," "to pen a letter"; or even of proper names, as "to burk," to "boycott"; and "macadamize," might better have been "macadam." English cannot be compared with Latin grammar with regard to the use of the definite article, for Latin has not the article: but when English is compared with other modern European languages, as German, French, Italian, etc., the English article is seen to be a "definite" article indeed. In those languages such words as time, life, humanity, patriotism, always have the article, but in English only when a definite time, life, etc., are in question.

JOSEPH FITZGERALD,
Author of 'Word and Phrase.'

Grammar-schools. See EDUCATION, SECONDARY.

Gramme, grăm, the standard unit of French measures of weight. A gramme = 15.43248 grains troy, from which the equivalents in English measure for the other weights can easily be found; thus:

		Grains Troy		Pounds Avoirdupois
Centigramme	=	.1543234	=	.0000220462
Decigramme	=	1.543234	=	.000220462
GRAMME	=	15.43234	=	.00220462
Decagramme	=	154.3234	=	.0220462
Hectogramme	=	1543.234	=	.220462
Kilogramme	=	15432.34	=	2.20462
Myriagramme	=	154323.4	=	22.0462
Quintal	=	1543234	=	220.462

See METRIC SYSTEM.

Gram'ophone. A sound-reproducing apparatus invented by Emile Berliner. In principle it is similar to the phonograph (q.v.) and the graphophone (q.v.), but differs from these by employing a glass disk coated with lampblack instead of a cylinder of wax for its record. This disk carries a stylus connecting with a diaphragm which is vibrated by the sound-waves, and records those vibrations upon the lampblack surface in the form of a long spiral, as the disk is revolved in a horizontal plane. Unlike the record cylinders of the phonograph or graphophone, the disk cannot be used directly to reproduce the sounds thus recorded, and for that purpose a corresponding disk of hard rubber, prepared from a metal die photo-mechanically etched from the original markings on the lampblack coating of the glass disk is employed.

Gram'pians, Grampian Hills, or **Grampian Mountains.** (1) The mountain system of Scotland, extending across the country from northeast to southwest, for a distance of about 150 miles, and separating the Highlands from the Lowlands. Its limits are not well defined, but it may be said to commence near the southwest end of Loch Awe, on the west coast of Argyleshire, where the main ridge runs, in a well-marked course, along the northern boundaries of Perthshire to Cairn Ealer, where it separates into two distinct branches — one stretching north-northeast on the north side of the Dee, and terminating near Huntly; the other running nearly due east on the south side of that river, and terminating in the neighborhood of Stonehaven. With the exception of Ben Nevis, the Grampians comprise all the highest mountains in Scotland. Among these are Ben Cruachan, 3,689 feet; Ben Lomond, 3,192 feet; Ben Lawers, 3,984 feet; Schichallion, 3,547 feet; Ben Macdhui, 4,296 feet; Cairngorm, 4,084 feet; Cairntoul, 4,241 feet. The more remarkable passes are those of Aberfoyle, Glenshee, and Killiecrankie.

(2) A low range of mountains in the western part of Victoria, in Australia, are called Grampians.

Gram'pus, or **Cowfish,** a genus of porpoises of the family *Delphinidæ*. The species inhabiting the North Atlantic (*Grampus griseus*), reaches a length of about 12 feet. The head is globose, with a slight indication of a beak; the lower jaw shorter than the upper; dorsal fin high and falcate. The upper surfaces of the body are gray in color, the belly grayish white. The body is usually marked with numerous, irregular, light-colored lines which are believed to be due to the attacks of the cuttlefish. The young have the front of the head yellowish white, and six or seven vertical white lines on the sides. There are from 6 to 14 rather large, blunt teeth in the lower jaw, but none in the upper jaw. On the Atlantic coast of North America the grampus occurs singly or in small schools, ranging southward to New Jersey. It also occurs on the coasts of Europe. A closely allied species (*G. Stearnsii*) inhabits the North Pacific, and the genus has been reported from the Cape of Good Hope and New Zealand. The grampus feeds upon cuttlefish, and yields oil of superior quality. The name grampus (from the Italian *gran pesce*, meaning simply "large fish") is applied also to various other cetaceans, and especially to the killer whale (*Orcinus orca*) and to the blackfish (*Globicephala*).

Gran Chaco, grän chä'kō, **El,** a territory of Argentina, Bolivia, and Paraguay, S. A., bounded south and west by Santiago del Estero, and west by Tucuman and Salta. Area, about 275,000 square miles. It is watered by the Vermejo and Pilcomayo and numerous other branches of the Paraguay. In the west it is intersected by spurs of the Andes, and in the east forms extensive plains and marshes, with tracts at times entirely inundated, while in the south are vast sandy deserts, interspersed with salt pools. It is thinly inhabited by Indians, who live chiefly by hunting and fishing. In some parts the forests are extensive, and the vegetation rich. Pop. 10,422.

Granada, gră-nä'da (Sp. grä-nä'dä), (1) An ancient kingdom, subsequently a province of southern Spain, bounded by Andalusia, Murcia, and the Mediterranean. It was part of the Roman province of Boetica, and after the Saracen invasion became an independent Moorish kingdom until it was conquered by Ferdinand and Isabella in 1492, when it became one of the 13 old provinces; it had an area of 11,100 square miles, and since 1833 is divided into the provinces of Granada, Almeria, and Malaga. (2) The modern province, with a coast line of 66 miles on the Mediterranean, has an area of 4,928 square miles. It is picturesquely diversified by mountains and valleys, the chief range being the Sierra Nevada, which attains a maximum altitude of 11,781 feet in the Cerro de Mulhacen, the loftiest summit in Spain. The province watered by the Guadalfeo, the Jenil, and Darro is comparatively fertile and well cultivated; and

abounds in mineral wealth. Pop. (1900) 492,460. The capital is (3) Granada, the ancient metropolis of the Moors. It is romantically situated on the rivers Darro and Jenil, at the foot of the snow-capped Sierra Nevada, which forms a background to the crescent-shaped city, with its terraced streets, turrets, and gilded cupolas rising above each other, the whole crowned by the Alhambra (q.v.), the famous citadel palace of the Moorish rulers. Seen from a distance the city has an imposing appearance, but the interior is in a state of decay, and the streets are narrow, irregular, and dirty. The principal buildings besides the Alhambra are, the Generalife, the royal Moorish summer palace, commanding a magnificent prospect; the cathedral, an irregular but splendid building; the archiepiscopal palace; and the residence of the provincial captain-general. Granada is the seat of a university founded in 1531, of several colleges, a normal school, and a school of art. It has various manufactures of local importance only, such as silks and woolens, leather, paper, hats, etc. Granada was founded by the Moors before 800, near the site of the ancient Illiberis, and from 1036 to 1234 was included in the kingdom of Cordova. In 1235 it became the capital of a new kingdom, and attained almost matchless splendor. In 1491 it remained the last stronghold of the Moors in Spain, and mustered 60,000 men to resist Ferdinand and Isabella. The defense proved unavailing, and the besiegers took possession in 1492. A year later it was made the seat of an archbishopric. The great body of its inhabitants still were Moors, and its prosperity continued almost without diminution till 1610, when it declined with the decree expelling the Moors from Spain. Pop. (1900) 75,900.

Granada, Nicaragua. (1) City, capital of the department of Granada; on Lake Nicaragua. It was founded in 1522 and was formerly the chief town of the republic, but has suffered greatly from the civil wars. It is a trading centre for dyewoods, cacao, gold and silver filigree hand-made ornaments, and hides. Pop. 11,879. (2) The department of Granada lies between the Pacific and Lakes Nicaragua and Managua; area about 2,600 square miles. The Mombacho Mountain, an extinct volcano, is the highest peak.

Granadil'la, the edible fruit of certain tropical species of passion-flowers (q.v.).

Gra'nary, The, an ancient burial ground in Boston, Mass., in Tremont Street. Here are buried Paul Revere, Samuel Adams, John Hancock, Peter Faneuil, Chief Justice Sewall, and several of the old colonial governors of Massachusetts.

Gran'bery, John Cowper, American bishop of the Methodist Episcopal Church South: b. Norfolk, Va., 5 Dec. 1829. Graduated from Randolph-Macon College in 1848, he entered the Methodist ministry in that year, was a chaplain in the Confederate army in 1861–5, and in 1875–82 professor of moral philosophy and practical theology in Vanderbilt University. His publications include: 'Twelve Sermons' (1896) and 'Experience the Crowning Evidence of the Christian Religion' (1900).

Gran'bury, Texas, town, county-seat of Hood County; on the Brazos River, the Fort W. and R. G. R.R. The chief manufactures are flour and farm implements. It has a cotton-gin, and is a trade centre for the products of the surrounding agricultural region. Pop. (1901) 3,773.

Gran'by, Canada, town, in Shefford County in the province of Quebec; about 40 miles southeast of Montreal. It is in an agricultural region, and its manufactures are chiefly for the local trade. Pop. (1901) 3,773.

Granby Token (1737), a private copper coinage issued by John Higley of Granby, Conn., where there were copper mines afterward used as Tory prisons and workshops. The obverse was a deer, with the legend «Value Me as You Please»; Roman numerals III. and crescent. The reverse was three hammers on a triangular field, each surmounted by a crown, and with the legend «I Am Good Copper.»

Grand, Sarah, pseudonym of Frances Elizabeth Clarke, English novelist: b. Ireland. When 16, she married Lieut.-Col. M'Fall, with whom she traveled in India, China and Japan; in 1901 she visited the United States. She has been active in the woman's movement, in England, serving as president of a Society for Woman's Suffrage, and of the Woman's International Progressive Union, and as vice-president of the Scottish Association for the Promotion of Woman's Public Work. Her first novel was 'Ideala,' written at 26, but the first work to give her a wide reputation was 'The Heavenly Twins' (1893). Her other writings include: 'Singularly Deluded'; 'A Domestic Experience'; 'Our Manifold Nature' (1894); 'The Beth Book' (1897); 'The Modern Man and Maid' (1898); 'Babs the Impossible' (1900).

Grand Army of the Republic, a patriotic association, organized in the interest of the surviving representatives of the military and naval forces of the Civil War, the families of those dead, and such objects as they think cognate with these. The membership is of soldiers and sailors of the War, honorably discharged or continuing, and State militia on active duty subject to national call during that time. It was worked up in Illinois in the winter of 1865–6, by Dr. B. F. Stephenson and Rev. W. J. Rudolph, the surgeon and the chaplain of the 14th Illinois Infantry; the first post was organized at Decatur, Ill., 6 April 1866; the first national «encampment» was held at Indianapolis 20 Nov. 1866. Its assigned objects are fraternity, commemoration, and assistance among the above classes; and it has aided in establishing soldiers' homes and memorials, and maintaining and educating soldiers' orphans. It also caused the institution of Memorial Day. It ruled in 1869 that it should not be used for partisan work, nominations, or debates, but naturally it has been a powerful factor in political calculations and the shaping of party conduct regarding both nomination of candidates for office and legislative action. It has also given out strong utterances against restraining liberality in pension legislation, and has used its influence to prevent official restriction in the expenditure of money under such legislation. It has headquarters in Philadelphia, and in 1902 reported 6,416 posts throughout the country, each State being a department with a commander. The membership was 263,745; it had been over 400,000 at

one time. The deaths during the year were 8,299. There is a national council of administration of 45. It holds annual meetings or encampments in the chief cities; the uniform is dark blue with black slouch hat. Its badge is a bronze star hung from a strap and ribbon flag; on the star in relief are a soldier and sailor clasping hands in front of a figure of Liberty, with two freedmen in the foreground, the United States flag on the sides. See WOMAN'S RELIEF CORPS.

Grand Cañon of the Colorado. See COLORADO RIVER; CAÑON; POWELL, JOHN WESLEY.

Grand Falls, or **Colebrooke,** Canada, port of entry, in Victoria County in New Brunswick; on the Saint John River, which is navigable to this point. The falls, which give the name to the place, are about 80 feet in height. Considerable trade is carried on in the agricultural products, and the small game which is abundant in the vicinity. Pop. 1,545.

Grand Falls, a cataract of the Grand River, in Labrador, British America. These falls are in a cañon of the Grand River, 25 miles long and nearly 500 feet deep. About four miles above the falls the river begins a rapid descent of 200 feet to the falls, where the precipice is 320 feet deep and 200 feet wide. Below the falls is another rapid descent of about 300 feet, and then a gradual descent to the ocean. The total descent from the beginning of the first above the falls to the ocean is about 2,000 feet. This cañon was discovered in 1839 by a Hudson Bay Company official named McLean; but no further report being made its existence became a memory until 1891, when it was rediscovered and in 1894 surveyed by the Canadian Geological Survey. (See GRAND RIVER.) Consult 'Report by Canadian Geological Survey.'

Grand Forks, N. Dak., city, county-seat of Grand Forks County; on the Red River of the North and the Red Lake River, and on the Northern P. and the Great N. R.R.'s; about 25 miles west of Crookston and 80 miles north of Fargo. It was settled in 1871 and incorporated in 1881. It is situated in an agricultural and lumbering region. Its chief manufactures are flour, lumber, foundry products, bricks, woolen goods, and steam-boilers. In addition to the trade in its manufactured articles it has a large trade in live stock, wheat, oats, and potatoes. It is the seat of the North Dakota State University, opened in 1884, the Grand Forks College, the Northwestern Normal College, and Saint Bernard's College. The city owns the electric-light plant for street lighting and the waterworks. In the last decade the city increased in population over 50 per cent. Pop. (1900) 7,652.

Grand Gulf, a locality in Mississippi, on the Mississippi River, south of Vicksburg. The Confederate batteries at this place were attacked by the forces under Farragut 31 March 1863, and frequent shelling and bombarding occurred from that time until May 3, when the place surrendered to the land and naval forces under Grant and Porter.

Grand Haven, Mich., a port of entry, city, and county-seat of Ottawa County, on Lake Michigan, at the mouth of Grand River, and on the Detroit, G. H. & M., and the Chicago & W. M. R.R.'s, 110 miles northeast of Chicago. It has an excellent harbor with two lighthouses; there is steamboat connection with the principal lake ports, and a large trade in lumber, grain, flour, leather, etc, is carried on. The city was founded in 1835; it is a summer resort of some popularity, with a noted mineral spring; has municipal waterworks and electric lighting plant, electric street railroads, a public library, and a fine park. Among its educational institutions is Akeley College for Girls. Its industries include the manufacture of lumber, wooden-ware, furniture, refrigerators, machinery, pianos, brass novelties, matches, shoes, barrels, etc.; market gardening is lucratively engaged in and the lake fisheries are important. Pop. (1900) 4,743.

Grand Island, Neb., city, county-seat of Hall County; near the Platte River; on the Burlington & M., the Union P., the Saint J. & G. I. R.R.'s; about 85 miles west of Lincoln and 127 miles southwest of Omaha. The first permanent settlement was made in 1869, and it was incorporated in 1872. It is situated in a fertile agricultural region. The chief manufactures are sugar, beet sugar, flour, canned fruits and vegetables, and brooms. Large repair shops for the Union Pacific Railroad are located here. There is an extensive trade in the manufactured articles, live stock, and wheat. Grand Island contains a number of wholesale establishments and is the distributing centre for a large section of the northwest of Nebraska. The State Soldiers' and Sailors' Home and St. Francis Hospital are located here. It is the seat of Grand Island College, opened in 1892 under the auspices of the Baptist Church, and it has a large free library. The present city charter, of 1901, provides for the election of a mayor every two years and a city council, in whom is vested the government. The city owns the waterworks. Pop. (1900) 7,554.

Grand Junction, Colo., city, county-seat of Mesa County; at the junction of the Grand and Gunnison rivers, on the Colorado and M. and the Denver & R. G. R.R.'s; about 97 miles northwest of Gunnison. It is in the midst of a good farming country, where the land is irrigated. It has a pyritic smelter, and a beet-sugar factory, flour- and lumber-mills. Its trade is chiefly in coal, lumber, bricks, grains, fruits, and vegetables. It is the seat of the Teller Institute, a school for Indian pupils. The waterworks and street car lines are owned by the municipality. Pop. (1900) 3,503.

Grand Jury. See JURY.

Grand Lake, one of the shallow bodies of water in the southern part of Louisiana, about 50 miles long. Its chief inlets are Atchafalaya and Grand rivers, and Lake Vernet. Its outlet is Myrtle Bayou, which flows in Atchafalaya Bay, an arm of the Gulf of Mexico.

Grand Manan, mă-năn', an island at the entrance of the Bay of Fundy, off the coast of Maine. It belongs to Charlotte County, in New Brunswick, Can.; area, about 100 square miles. On the north coast, at Indian Beach, is a settlement of Indians. Fishing is the chief occupation, but the large forests still furnish material for ship-building and some lumber. The island is a favorite summer resort, because

of its climate and abundance of small game. Pop. 2,590.

Grand Prix de Rome, grän prē dė rōm, a prize given annually by the Academy of Fine Arts in Paris to the most successful competitor in painting, music, sculpture, etc. The winners of the prize become the charge of the government for four years and are sent to Rome to reside. See ECOLE DES BEAUX ARTS.

Grand Rapids, Mich., city and county-seat of Kent County, second to Detroit in population and importance, is situated on both sides of Grand River, about 30 miles from Lake Michigan, 152 miles from Detroit, 180 miles from Chicago; lat. 42° 57′ 49.02″ N., lon. 85° 40′ 1.65″ W.

Railroads.—The first railroad into Grand Rapids was the Grand Trunk, from Detroit to Grand Haven, in 1858. Since then have been built the Grand Rapids & Indiana, the Michigan Central, the Lake Shore & Michigan Southern, and the Pere Marquette. These roads radiate in 11 different directions, with through trains to all important Michigan cities, Chicago, Cincinnati, and Toledo. The Grand Rapids & Indiana and the Pere Marquette have extensive shops, the latter established in the past year and representing an investment in land, buildings, and equipment of over $500,000. Two interurban lines run out of the city, the Grand Rapids, Holland & Lake Michigan to Holland and Saugatuck, with South Haven, Saint Joseph, and Chicago future objective points; and the Grand Rapids, Grand Haven & Muskegon. Another line is under contract to be built (1905) to Ionia and thence to Lansing, and lines south to Kalamazoo and north to Rockford are projected.

Industries.—Grand Rapids is the base of supplies and the distributing point for western and northern Michigan. It has large wholesale and jobbing houses in groceries, provisions, clothing, dry goods, millinery, carpets, crockery, drugs, paper, cigars, boots and shoes, knit goods, sporting goods, hardware, mill supplies, and in other lines. The chief industry is the manufacture of furniture (see FURNITURE INDUSTRY), with 38 factories, capital $8,005,713, employing 6,654 hands, and annual product valued at $9,409,097. These statistics are from the special United States census taken in 1904. New York and Chicago in their order exceed Grand Rapids in the volume of their furniture production, but Grand Rapids is the recognized leader in design, finish, and quality. Semi-annually, in January for the spring season, and July for the fall, buyers come here from all parts of the United States and from foreign lands to inspect the new styles and to place orders. The semi-annual visitors number from 800 to 1,000. Between 300 and 400 manufacturers of furniture and kindred lines in other parts of the country semi-annually send their samples here for the buyers to inspect. The outside manufacturers occupy large furniture exposition buildings, built for their use, in the heart of the city. There are four of these exposition buildings, one occupying an entire square, five stories high, and two more are projected.

Other important industries and the value of the annual product are (1904): Flour and grist-mill products, $2,370,787; machinery and foundry, $1,265,298; bread and bakery goods, $1,178,138; lumber and planing-mill, $967,396; carriages and wagons, $494,617; hosiery and knit goods, $590,472; wood ornaments, $419,827; men's clothing, $337,900; tobacco and cigars, $574,726; shirts, $111,625; miscellaneous, $11,802,898. The census shows a total of 389 factories, with $25,915,861 capital, employing 15,707 hands, paying $7,392,748 in wages, using $14,615,176 worth of material, and producing goods valued at $31,032,589. The largest sticky fly-paper and carpet-sweeper factories in the world are located here. Twenty-five per cent of the total United States production of gypsum is from the Grand Rapids quarries.

Fruit-growing.—Grand Rapids is also the centre of the West Michigan fruit belt, which extends along Lake Michigan from Saint Joseph to Traverse City. The 1904 peach crop in Michigan was a partial failure, but 479,000 bushels of peaches were marketed here; also 741,000 bushels of apples; 57,000 bushels of cherries, 52,000 bushels of plums; 8,300 barrels of pears; 200,000 crates of strawberries; 96,000 of blackberries; 91,500 of raspberries, besides large quantities of other fruit. The value of the crop marketed here was estimated at $1,850,280. This does not include the large quantities of fruit purchased from this city as a base in Mason, Oceana, Muskegon, Ottawa, Allegan, and Van Buren counties and shipped direct to the consuming market. With an average crop the peaches marketed here will exceed 1,000,000 bushels. This is also an important winter lettuce centre, Chicago, Cincinnati, Saint Louis, and even New York drawing on the Grand Rapids growers for their supplies. One of the most popular varieties of winter lettuce originated here and is named the Grand Rapids.

Banks.—The city has five national banks, capitalized at $2,300,000, five state banks capitalized at $650,000, and one trust company, $200,000. A sixth state bank, capital $100,000, will begin business early in the summer of 1905. The January 1905 statement showed total loans and discounts, $15,868,050.88; stocks, bonds, and mortgages, $6,495,646.93; commercial deposits, $7,733,544.54; savings and certificate deposits, $11,486,877.91; and total deposits, $21,415,024.93. The bank clearings in 1904 were $101,037,199.30.

Churches, Schools, etc.—All the Christian church denominations are represented with congregations and churches. The bishops of the Grand Rapids Catholic diocese and West Michigan Protestant Episcopal diocese live here. The Catholics have a cathedral. The total value of church property is estimated at $1,500,000. The Catholics hold $455,800; Holland Reformed, $228,100; Methodist Episcopal, $153,900; Congregational, $117,900; Baptist, $110,100; Protestant Episcopal, $100,200; Lutheran, $98,800; Presbyterian, $68,200; and other denominations in smaller amounts.

The Holland Theological Seminary, one of the chief educational institutions of the Holland Reformed Church in America, is located here. The Catholics, Lutherans, and Holland Reformed Churches have parochial schools accommodating about 5,000 pupils.

The city owns one high school and 35 ward schools, estimated in value at $1,510,000, managed by an elective board of education of 24

members and the mayor *ex officio*. A movement is on foot to reduce the board to a smaller body. It is also proposed to build a manual training school to cost $60,000. The school enrolment is about 15,000; the cost of maintenance by direct taxation is about $400,000.

The Ryerson public library, a gift to the city of his birth by Martin A. Ryerson of Chicago, contains 65,000 volumes. It is controlled by an elective board of five members. The museum, under the control of the board of education, occupies property costing $30,000, and is especially strong in natural history specimens.

Public Institutions.— The Michigan Soldiers' Home, maintained by the State, with accommodations for 1,000 veterans and 200 widows, is located three miles north of the city. The Michigan Masonic Home, maintained by the Michigan Grand Lodge of Masons, with 250 inmates, is located three miles east of the city. There are three large hospitals, two orphan asylums, one home for the aged, two refuges for unfortunate women, and several minor philanthropics. The city maintains a hospital and the county has a farm and hospital.

Public Buildings.— The public buildings are city hall, valued at $300,000; court-house, $250,000; federal building and post-office, $350,000; county jail, $50,000; Ryerson public building, $350,000; museum, $30,000; police headquarters, $66,000. A bill was favorably reported in the last Congress appropriating $500,000 for a new government building.

Newspapers, Theatres, etc.— The city has three daily newspapers, *The Grand Rapids Herald* (morning), and *The Press* and *The Post* (evening). The city has four theatres.

Clubs and Societies.— The Peninsular Club with 350 business men members owns a club house in the heart of the city valued with real estate at $150,000. The Lakeside Club with 800 members has a club house at Reeds Lake costing $60,000. The Kent County Club owns 100 acres of land and a $15,000 club house in the north part of the city. The Germans have four club houses and halls; the Irish, the Danish and the Polish each one. The Ladies' Literary Club, the Grand Rapids Woman's Club, the West Side Ladies' Literary Club, and the St. Cecelia (musical) Society, all made up exclusively of women, own club houses. The Ladies' Literary club house, built about 30 years ago, was one of the first of the kind in the country. The Young Men's Christian Association has nearly 1,000 members and owns and occupies a building that cost $60,000. The Grand Rapids board of trade has 1,200 members.

Parks and Resorts.— The city has John Ball Park of 100 acres, the original 40 acres of which was the gift of John Ball; the Antoine Campau Park of five acres, the gift of Martin A. Ryerson; Highland Park of eight acres; Fulton Street Park occupying a square, and numerous small parks. The parks are estimated in value at $350,000. Comstock Park of 100 acres is owned by the West Michigan Fair Association, and if it shall cease to be used for fair purposes the property will revert to the city. Reeds Lake, three miles east of the city, and North Park, near the Soldiers' Home up the river, are popular nearby summer resorts. The Lake Michigan resorts at Saugatuck, Holland, Grand Haven, and Muskegon are one hour away by rail. The northern Michigan resorts are easily accessible.

Public Utilities.— The city owns its own waterworks, with Grand River as a source of supply and 150 miles of mains of all sizes, also owns its own electric lighting plant, garbage burner and market. There are 286 miles of street, of which 173 miles are improved. Of the latter, 7 miles are asphalt, 9 brick on concrete foundations, 4 cedar block on concrete, and 6 macadam. Six bridges owned by the city span the river, one at Bridge Street being of concrete construction, four steel and one wood Commercial lighting is furnished by the Grand Rapids Gas Light Company and Edison Electric Light Company, each having a monopoly in its field. The Grand Rapids Railway Company with 60 miles of track, mostly double, controls the street railways.

Government.— Municipal affairs are conducted by a mayor, elected for a term of two years, and a council of 24 aldermen, two from each ward elected for two-year terms, half retiring each year. The fire and police departments, the health, the poor, and the public works departments are under the control of boards appointed by the mayor. The total bonded indebtedness of the city is $2,203,000, of which $1,025,000 is water, $218,000 schools, and $460,000 street improvements. The property owned by the city is estimated in value at $5,593,483.66, not including the schools, library and museum properties. The expenditures for public improvements in 1904 aggregated $233,846, of which $212,091 was for street improvements and $21,755 for sewers.

History.— In 1828 Louis Campau established an Indian trading station here, and in 1831, after the government survey, made the first entry of land. The first settlers, Joel Guild and family, arrived in June 1833. Grand Rapids was incorporated as a village in 1838 and as a city in 1850.

Population.— (1850), 2,686; (1870), 16,507; (1890), 64,147; (1900), 87,565, and the State census of 1904 gave it 95,718. Thickly settled suburbs will add approximately 10,000.

LEWIS G. STUART,
Managing Editor, 'The Grand Rapids Herald.'

Grand Rapids, Wis., a city and the county-seat of Wood County, on the Wisconsin River, the Wisconsin C., the Chicago, M. & St. P., the Chicago & N., and other railroads, about 70 miles northwest of Oshkosh. The river is spanned by a fine bridge connecting with Centralia, a suburban municipality prior to 1900, when it was incorporated with Grand Rapids. Lumbering and agriculture are the chief occupations of the inhabitants and there are lumber, pulp, paper, and flour mills, manufactures of furniture, foundries and machine shops. In the neighborhood are deposits of kaolin. Pop. (1900) 4,493.

Grand Rapids & Indiana Railway Company. This company, fifth in succession, owning a completed line of railroad starting at Fort Wayne, Ind., running thence northerly through the city of Grand Rapids and the western section of Michigan to the Straits of Mackinac, 366.63 miles main line, with spurs and branches in Michigan, aggregating 413.69 miles, had its inception first in January 1854, at Hart-

ford, Ind., where a company known as Grand Rapids & Indiana Company No. 1 was formed with the idea of building a railroad from Louisville, Ky., to the Michigan pineries, but accomplished nothing more than locating a line from Hartford to the northern State line of Indiana, and also as far as Sturgis, Mich.

In May 1855 the Grand Rapids & Southern Railroad Company was organized in Michigan by the same interests to build a railroad from Grand Rapids to the Indiana State line, and consolidated with the first company in September 1855, forming Grand Rapids & Indiana Company No. 2. Upon this company the State of Michigan, by an act of 14 Feb. 1857, conferred the lands granted to the State by an Act of Congress 3 June 1856, to aid in the construction of a railroad from Grand Rapids to some point on Little Traverse Bay.

In June 1857 the Grand Rapids & Mackinaw Railroad Company and the Grand Rapids & Fort Wayne Railroad Company were created and consolidated, forming Grand Rapids & Indiana Company No. 3.

The first 13 years of the life of this enterprise is replete with failures to construct any portion of its line between Fort Wayne and Grand Rapids. With the aid derived from the bonds voted by the cities of Fort Wayne and Grand Rapids it finally completed in December 1867 the first 20 miles of road from Grand Rapids north to Cedar Springs. As early as 1860 and 1861 the company had made two mortgages, the first to secure $5,000,000 and the second $4,500,000.

On 30 Sept. 1869 a contract was entered into by the Pennsylvania Railroad Company, lessee of the Pittsburgh, Fort Wayne & Chicago Railway, the Continental Improvement Company, and the Grand Rapids & Indiana Railroad Company, for an issue of $8,000,000 seven per cent bonds, secured upon the lands and road, running 30 years from 1 Oct. 1869 — $4,000,000 of which were guaranteed by the Pittsburgh, Fort Wayne & Chicago Railway Company, and $4,000,000 unguaranteed. With part of the proceeds of these bonds and the proceeds of $3,000,000 of debenture bonds, the Continental Improvement Company completed the road from Fort Wayne to Petoskey (Little Traverse Bay) in November 1873. The cost of road and equipment as per settlement contract was $10,848,250.

In June 1871 the Grand Rapids & Indiana Railroad Company took a lease for 99 years of the Cincinnati, Richmond & Fort Wayne Railroad, then building, and which was completed in December 1871, from Richmond, Ind., to Adams (five miles east of Fort Wayne), 86 miles, to be used as an outlet south of Fort Wayne for the traffic of the Grand Rapids & Indiana Railroad.

The Continental Improvement Company, under a contract with the Traverse City Railroad Company, dated December 1871, completed the Traverse City Railroad from Traverse City to Walton Junction, 26 miles, in December 1872, and this road was leased to the Grand Rapids & Indiana Railroad Company for 50 years from January 1883, rental being net earnings, which were guaranteed to equal annual interest on first mortgage bonds, $250,000.

In June 1881 the Grand Rapids, Indiana & Mackinaw Railroad Company was organized in the interest of the Grand Rapids & Indiana Railroad Company for the purpose of extending its road from Bay View to Mackinaw City. This portion of the line was open for operation in July 1882. This company was consolidated with Grand Rapids & Indiana Company (No. 3) in October 1884, under the name of Grand Rapids & Indiana Company (No. 4).

The Bay View, Little Traverse & Mackinaw Railroad Company, line from Bay View to Harbor Springs, Mich., six miles, completed its road in 1882; was sold under foreclosure proceedings in February 1888, and purchased at sale by the Grand Rapids & Indiana Railroad Company, which owned all its stock and bonds.

The Muskegon, Grand Rapids & Indiana Railroad Company was organized in the interest of the Grand Rapids & Indiana Railroad Company in February 1886. The road was completed from Muskegon to Grand Rapids, 37 miles, in December 1886, and leased to the Grand Rapids & Indiana Railroad Company for 99 years from time of its completion, June 1886, rental being net earnings, which were guaranteed by the lessee to be equal to the fixed charges (interest on $750,000 five per cent bonds), and 20 per cent of gross earnings of all business interchanged; but the excess of expenditure over earnings forced the sale under foreclosure 10 June 1896.

A new company was organized as the Grand Rapids & Indiana Railway Company, was incorporated in Indiana and Michigan in July 1896, and commenced operation of the road 1 Aug. 1896, with a capital stock of $6,000,000. Of this, $4,291,000 was exchanged for third mortgage 5 per cent bonds, and $1,500,700 for debts, and also provided for a second mortgage of $5,000,000 (2 per cent first year, 3 per cent two years, and 4 per cent thereafter), of which $3,962,000 were exchanged for second mortgage bonds and certain debts of the old company; the remainder held in treasury for necessary betterments to the property in its then depleted condition.

For the year ending 31 Dec. 1904 the total earnings were $3,302,346, and the operating expenses were $2,680,487, thus showing net earnings for the year of $621,859.

By economical management and wise expenditures for betterments and additions, the company was enabled to make a slight return in the shape of dividends to its shareholders, first in 1900, beginning with 1 per cent and now paying 3 per cent; but is confronted by such hostile legislation in Michigan, both in the reduction of its passenger fares and increased taxation, to such an extent that it is a serious question whether it can continue the small return to those who furnished the capital, so long in advance of its needs, to develop western Michigan and northern Indiana.

W. R. Shelby,
Vice-President G. R. & I. Ry. Co.

Grand Remonstrance, a document of protest against misgovernment, drawn up by the House of Commons on 22 Nov. 1641 and presented to Charles I. of England on 1 Dec. 1641. The causes leading up to this written protest were many, and its passage, by a majority of 11, by the House after a long, stormy debate, was undoubtedly hastened by the outbreak of rebellion in Ireland, and also the absence of the

king, who at the time was in Scotland. The Puritan leaders had become disgusted with the intrigues carried on by the king with the Earl of Montrose, and in this document the grievances were set forth in such a manner that they were in fact an indictment of the whole governmental policy of the king. The imprisonment of members of Parliament without cause, the billeting of soldiers, the high-handed methods of the Star Chamber, High Commission, and the Council of the North, the excessive abuses of the commercial monopolies, and the unwarranted extension of the royal forests, as well as other minor grievances, in all 204 sections, were the points discussed in the manifesto. In it were also asked the appointment of new ministers, and that to a synod of learned divines be given the task of Church reform. King Charles ridiculed the document when it was presented for his consideration; on 10 December gave an indirect reply to the criticisms contained therein in shape of a proclamation on religion; on 23 December answered the petition in an extremely evasive manner; and on 3 Jan. 1642, before the House of Lords, impeached the leaders in the Commons who were most opposed to him, and who had been most instrumental in the passage of the document.

Grand River, a tributary of the Colorado River, which has its rise in the northwestern part of the State of Colorado, in the Rocky Mountains, and flows south by west into the State of Utah to latitude 40° 39', and then almost directly south to 35° 40', where it unites with the Green River (q.v.) to form the Colorado. Its length is almost 400 miles. Its chief tributaries are the Dolores and Gunnison. There are many deep cañons along its course through the mountains, and although much of the valley land is fertile, but few settlements have as yet been made.

Grand River, in the southern part of Iowa, has its source in the central part of Adair County and flows southeast through several counties in Iowa and Missouri, a distance of about 300 miles, into the Missouri River at Brunswick, Mo.

Grand, or **Hamilton River,** in Labrador, is the largest river in this section of British America which flows into the Atlantic Ocean. Part of its course is through a mountainous region, and it is the outlet of several lakes. The Canadian Geological Survey of 1894 gives the first reliable descriptions of this river and the adjacent country. See Grand Falls.

Grand River, in Michigan, has its rise in Jackson County, flows north and west in an irregular course for about one half its distance, then west by north to Lake Michigan. Its whole length is nearly 300 miles, although a direct line from its source to its mouth is only about 100 miles. It is navigable from Grand Haven, at its mouth, to Grand Rapids, a distance of 40 miles.

Grand Traverse Bay, an extension of Lake Michigan projecting into the State of Michigan, and named from Grand Traverse County, by which it is bounded on the south. The southern part of the bay is divided into two arms by Preogenise Point, the western arm being bounded by Leelenaw County and the eastern arm by Antrim County.

Grand Trianon, grän trē-ä-nôṅ, Versailles, France, a one-storied palace of considerable extent, formerly a private residence of the French sovereigns, and originally built for Madame de Maintenon by Louis XIV. The palace is visited for its historic interest; its numerous apartments retain much of the original furniture, and contain several fine modern works of art. It is called the Grand or Great Trianon to distinguish it from the Petit Trianon (q.v.).

Grandledge, Mich., city in Eaton County, on the Grand River and the Pere M. R.R.; 14 miles northwest of Lansing. The manufactures are flour, canned goods, sewer-pipe, furniture, and foundry products; and its trade is in its manufactured articles, and the products of the surrounding agricultural country. Pop. (1900) 2,161.

Grand Old Man, The, a name popularly applied to W. E. Gladstone (q.v.).

Grandpré, gräṅ-prā, Canada, village in King's County, in the province of Nova Scotia; on the Minas Basin. Longfellow's poem, 'Evangeline,' has made famous this village and the country around. In 1613 the French settlers living here were driven from their homes by British soldiers. (See Nova Scotia.) Consult Eaton, 'Acadian Legends and Lyrics.'

Grandville, gräṅ-vēl. See Gerard, Jean I. I.

Granet, grä-nā', **François Marius,** French painter: b. Aix, in Provence, 1775; d. there 21 Nov. 1849. After studying under Constantin and David, in 1802 he went to Rome, spending much of his life there. He gained an enviable reputation as a painter of architectural subjects, though no small number of his works are historical. He was appointed custodian of the paintings in the Louvre in 1826, and upon his death bequeathed his fortune to his native city for the erection and maintenance of a museum there. The most famous of his works are: 'Interieur de l'église des Capuchins à Rome' (1819); 'Englise souterraine d'Assise' (1823); 'Le Tasse visitè dans sa prison par Montaigne'; and 'Prise d'habit au couvent de Saint-Claire à Rome.'

Grange. See Grangers.

Grangemouth, Scotland, city and seaport of southeast Stirlingshire, situated near the confluence of the Carron and Forth rivers, and about three miles northeast of Falkirk. Situated as it is, close to the Firth of Forth, and at the entrance of the Clyde Canal, it is one of the most important of Scottish ports, ranking third in value of imports and exports. The immense docks are 28 acres in extent, the timber basins cover 32 acres, and the total quayage amounts to about 2,300 yards. The principal industries are ship-building and coal-mining, while the manufacture of iron and steel, brick and tile is carried on to a considerable extent. The total value of imports in 1898 was about $13,000,000, an increase from $5,500,000 in 1888; the exports in 1888 were valued at $3,500,000, which in 1898 increased to $11,000,000. The main article exported was coal, and the imports consisted mostly of timber, pig-iron, and iron ore. The

town has a building for its administrative purposes; there are also a public library, a public institute, and a large park. Pop. (1901) 7,968.

Granger, grān'jėr, **Francis,** American politician: b. Suffield, Conn., 1792; d. 1868. He was the son of Gideon Granger (q.v.). Graduated from Yale in 1811, he began the practice of law in 1814, was elected from Ontario County to the State legislature of New York in 1825, was re-elected in 1826, and was a delegate to the Harrisburg (Pa.) Protectionist convention. He was prominent in the anti-Masonic movement of the time. In 1834 he was a leading candidate of the newly organized Whigs for the nomination for governor, and in 1834 and 1838 was elected to Congress, and in 1841 became postmaster-general in President Harrison's cabinet. He sat again in Congress in 1841–2, led the stampede of the Whig convention at Syracuse in 1850, and in 1861 was a member of the Peace convention held at Washington.

Granger, Gideon, American politician: b. Suffield, Conn., 19 July 1767; d. 31 Dec. 1822. He was graduated at Yale College in 1787, and having been admitted to the bar, rose to eminence in his profession, and was elected a member of the legislature of his native State. He had an active part in establishing the Connecticut school fund, and in 1801 President Jefferson appointed him postmaster-general. He retained office during both of Jefferson's terms, and was reappointed by President Madison, whose policy he nevertheless opposed. He was consequently displaced in 1814, soon after Madison's second inauguration. He then removed to Canandaigua, N. Y., and was chosen a member of the senate of New York in 1819. He promoted internal improvements, and gave 1,000 acres to further the construction of the Erie canal.

Granger, Gordon, American soldier: b. New York 1821; d. Santa Fé, N. M., 10 Jan. 1876. He was graduated from the United States Military Academy in 1845, served with distinction in the Mexican war, during the Civil War was appointed, in 1862, to the command of the Army of Kentucky, with rank of major-general of volunteers, was prominent at Chickamauga, commanded a division at Fort Gaines (Ala.) (1864), and the Thirteenth Army corps in the capture of Fort Morgan. Brevetted major-general for the capture of these forts, he was mustered out of the volunteers in 1866; in that year was promoted to be colonel, and afterward was commander of the district of New Mexico.

Granger, James, English writer and print collector: b. Shaston, Dorset, in 1723; d. Shiplake, Oxfordshire, 4 April 1776. After graduating from Christ Church, Oxford, in 1743, he took holy orders and was assigned to the vicarage of Shiplake. After a long pastorate there he went on a tour through Holland, in 1773. He wrote: 'A Biographical History of England . . . with a preface showing the utility of a collection of engraved portraits, etc.' (1769). By 1824 his works had received enough additions to make six volumes. In 1806 the Rev. Mark Noble edited another edition of his works, and since then several editions of his works, together with additions by other authors, have appeared. Two of his sermons were also published, entitled 'An Apology for the Brute Creation' (1772); and 'The Nature and Extent of Industry' (1775).

Granger, Robert Seaman, American soldier: b. Zanesville, Ohio, 24 May 1816; d. Washington, D. C., 25 April 1894. A graduate of the United States Military Academy, he served in the Seminole, Mexican, and Civil wars, and in the last named was brigadier-general of volunteers in 1862–5. During the Civil War he commanded the military district of northern Alabama, in 1864, in the same year defended Decatur against Hood, and in 1865, during the occupation commanded northern Alabama.

Granger Cases (said by Justice Field during the trial to be the popular term outside for the whole group; but only as being in the farmers' interest, not because the Patrons of Husbandry, or any of its lodges as such, had anything to do with them), six cases decided in the United States Supreme Court, October term, 1876, all bearing on the same point and decided on the same principles. They were Munn *v.* Illinois; Chicago, B. & Q. R.R. Co. *v.* Iowa; Peik *v.* Chicago & N. W. R.R. Co.; Chicago, M. & St. P. R.R. Co. *v.* Ackley; Winona & St. P. R.R. Co. *v.* Blake; and Stone *v.* Wisconsin. The first, whose decision ruled the others and was given at much the greatest length, was to test whether the act of the Illinois legislature, 25 April 1871, to regulate public warehouses and the inspection and handling of grain, was constitutional. The case was an extreme one; the act was passed for warehouses only in "cities of over 100,000 people" (Chicago), and was therefore a special discrimination; it laid a host of minute, costly, and laborious impositions on warehousemen and elevator owners, and obliged them to publish daily in the newspapers a table of the charges made the previous year, which must not be increased during the current year — therefore, of course, never, as each year was a canon for the next. The court decided that, according to immemorial common law, the government had a right to regulate the use of property for the public good, and to fix maximum charges for public services of those with whom the public has no choice but to deal. Such regulations were never supposed to deprive private owners of their property, but the devotion of property to a use in which the public has an interest subjects it *pro tanto* to public control. In other words, the public is a partner in public corporations. The forms of law may be changed at the will of the legislative body, so long as they only give new effect to old provisions. And warehouses exclusively within one State may be regulated by State legislation, even though their business involves interstate relations. Justice Field made a powerful dissenting argument, concurred in by Justice Strong, on the ground that the legislature had no right to meddle with private business, and it was simply giving that body the power to confiscate private property, contrary to the Constitution. The railroad cases were all against the power of the States under legislation to enforce maximum transportation rates. The decisions were the same in essence, but the court declined to pronounce that the roads would forfeit their charter if they disobeyed the law, which, nevertheless was not repugnant to the Constitution. The division of the court was

the same; and Justice Field again stated the case for the companies. It was, that the charters of the roads were constitutional, and the right to reasonable compensation was the essential feature of the grant; that what was reasonable was a question for the judges and not the legislature to determine. Such regulation of fares as would take from a company the power to meet its just obligations was illegal, and only the courts could determine the facts; this, therefore, was taking away private property without process of law. Such an interpretation of the limits of legislative power over corporations places them at the mercy of every legislative majority. It makes all business public business, and practically destroys all the guaranties of the Constitution.

Grangers, the popular name for the Patrons of Husbandry, a secret association in the interests of agriculture. In 1866 the government sent O. H. Kelley (on the staff of the Department of Agriculture) to inspect and report on agricultural conditions in the South, and suggest means of improving them; he found them very wretched, and the farmers poor, backward, and disintegrated. Considering organization the first requisite for self-defense, and for securing improved methods and needed legislation, he, with six others, formed in December 1867 the National Grange (Farm) of Patrons of Industry. Only farmers could be members; but their women were admitted both to membership and office. The machinery was like that of other secret societies; the local bodies were called granges, and each State had its State grange. There were four «degrees» in local granges, one in State «Pomona,» and two in national («Flora» and «Ceres»). For the first four years the growth was slow; in 1872 it began to spread rapidly, in a year it had over 10,000 granges, and in 1875 its membership was 1,500,000, distributed through every State in the Union. By its rules the order was to have no part in political work, nominations, or discussions, and as an order it had none, but the members could not be expected to neglect the very object of its existence, and almost immediately they began work against railroad rates and discriminations, trusts, «futures,» oleomargarin, etc., besides forming the chief part of the great movement against hard money (see GREENBACK PARTY) — in all of which their organization, and the consequent bid for their support from political parties, aided them enormously. It is therefore not surprising that «granger» has become a typical adjective for all measures in the supposed interest of the western and southern farmers, or of which they form the chief support, the word having the sanction of the highest court (see GRANGER CASES). The Department of Agriculture as a Cabinet office, the act for founding experiment stations, and the Interstate Commerce Bureau are among the more legitimate fruits of the order; others are the subject of much difference of opinion. It has also done much to form co-operative societies, and attempted to make the grain-elevator system a portion of it. The political element, however, was discrediting the whole movement by its excesses and ill judgment, and finally took separate shape as the Farmers' Alliance and the Populist Party (qq.v.), leaving the diminished Patrons of Husbandry to a useful and growing social and industrial influence. Consult: 'American Annals of Political Science,' Vol. IV.; 'Popular Science Monthly,' Vol. XXXII.

Granite, an unstratified rock, normally consisting of three simple minerals, feldspar, quartz, and mica, or, in Dana's nomenclature, of orthoclase, quartz, and mica. For a long time the universally accepted view which is still the prevalent one, was that it is an «igneous» rock of a «plutonic» type. The difficulty has, however, to be encountered that it is not seen in process of formation on the earth's surface. This has been met by the hypothesis that it originates beneath the surface and under high pressure, produced in most cases by earth, but in some instances by a weight of incumbent water. Like surface volcanic rocks it has been fused and afterward cooled; but it does not, like them, comprehend tuffs and breccias, etc., but assumes a crystalline texture, destitute of pores, or cellular cavities to which gases entangled in lava or any such rock give rise. It is in favor of its igneous origin that it has in many places broken through ordinary sedimentary or metamorphic strata, sending veins through them in various directions. It rarely, however, overtops or caps them, as if coming up molten through a crater it had overflowed them above. Hence the term proposed for it — «underlying» — to distinguish it from the volcanic rocks, called «overlying» rocks. It is of all ages, some granite in the Alps having broken up the strata during Tertiary times. Granite encloses fluid cavities, having in them water, containing chlorides of potassium and sodium, with sulphates of potash, soda, and lime. Granite hills have a peculiar rounded form, with a scanty vegetation. They are easily distinguishable from the flat-topped precipice flanked basaltic hills. Von Buch considers that granitic mountains so much tend to be portions of a sphere, that he looks upon them as ellipsoidal bubbles, which were forced upward only in a partially fluid state; then, when the upper dome-shaped surface contracted, many granitic blocks were formed. Granite is of much economic value as a building stone. The production of granite in the United States in 1900 was valued at $12,675,617. The leading States in its production were Maine, Massachusetts, Vermont, and Delaware. See GEOLOGY; STONE.

Granite State, The, the popular name of New Hampshire. Fine building granite is quarried at many points, notably at Plymouth Concord, Milford, Pelham, etc.

Grant, SIR **Alexander,** English educator: b. New York 13 Sept. 1826; d. Edinburgh 30 Nov. 1884. He went to India in 1859, and in 1862 became principal of the Elphinstone College, Madras, and in 1863 was made vice-chancellor of Bombay University. In 1868 he returned to Scotland to become principal of the University of Edinburgh, a position which he held till his death. He wrote: 'Story of the University of Edinburgh' (1883); and annotated and edited Aristotle's 'Ethics' and Xenophon.

Grant, Frederick Dent, American soldier: b. St. Louis, Mo., 30 May 1850. The eldest son of Gen. Ulysses S. Grant (q.v.), he was graduated from the United States Military Academy in 1871, was assigned to the 4th cavalry, was aide-de-camp to Sheridan in the latter's Indian

campaigns, in 1874 served in the Black Hills expedition, and in 1881 resigned from the army with rank of colonel. Later in business at New York, he was minister to Austria in 1888–93, and a police commissioner of New York in 1897 during the Strong administration. At the outbreak of the Spanish-American war (1898) he became colonel of the 144th New York volunteers, was in the same year appointed brigadier-general of volunteers, served for a year in Porto Rico, and subsequently commanded the military district of San Juan. He was also stationed in the Philippines, and appointed brigadier-general in the regular service in 1901.

Grant, James Augustus, British soldier and explorer: b. Nairn, Scotland, 1827; d. there 11 Feb. 1892. He accompanied Capt. Speke in his search for the sources of the Nile (1860–3), when they explored the Victoria Nyanza and were rewarded by the discovery of the river issuing from the north of the lake. This expedition was described in a volume entitled 'A Walk Across Africa' (1874).

Grant, Robert, American author and judge: b. Boston, Mass., 24 Jan. 1852. He was graduated from Harvard in 1873 and the Harvard Law School in 1879, and has practised law in his native city since 1879. He was one of the water commissioners of Boston 1888–93, and in the latter year became a judge of probate and insolvency for Suffolk County, Mass. He has published: 'The Little Tin Gods on Wheels' (1879); 'Confessions of a Frivolous Girl' (1880); 'The Lambs,' verse (1882); 'An Average Man' (883); 'Face to Face' (1886); 'Jack Hall' (1887); 'Jack in the Bush' (1888); 'The Reflections of a Married Man' (1892); 'The Opinions of a Philosopher' (1893); 'The Art of Living' (1895); 'The Bachelor's Christmas' (1895); 'Search Light Letters' (1899); 'Unleavened Bread,' a novel which has been widely read (1900).

Grant, Ulysses Simpson, American general and 18th President of the United States: b. 27 April 1822, in a small two-room cabin situated in Point Pleasant, a village in southern Ohio, about 40 miles above Cincinnati; d. Mt. McGregor, N. Y., 23 July 1885. His father, Jesse R. Grant, was a powerful, alert, and resolute man, ready of speech and of fair education for the time. Ulysses Grant grew to be a sturdy, self-reliant boy. He loved horses, and became a remarkable rider and teamster at a very early age. At the age of 17 he was a fair scholar for his opportunities, and his ambitious father procured for him an appointment to the Military Academy at West Point.

His record at West Point was a good one in mathematics and fair in most of his studies. He graduated at about the middle of his class, which numbered 39. He asked to be assigned to cavalry duty, but was brevetted second lieutenant of the 4th infantry, and ordered to Jefferson Barracks, near St. Louis. Here he remained till the spring of 1844, when his regiment was ordered to a point on the southwestern frontier, near the present town of Natchitoches, La. Here he remained till May 1845, when the Mexican War opened, and for the next three years he served with his regiment in every battle except Buena Vista. He was twice promoted for gallant conduct, and demonstrated his great coolness, resource, and bravery under the hottest fire. He was regimental quartermaster much of the time, and might honorably have kept out of battle, but contrived to be in the forefront with his command.

He was regimental quartermaster at Fort Vancouver, near Portland, Oregon, for one year. In 1853 he was promoted to a captaincy and ordered to Fort Humboldt, near Eureka in California. In 1854, becoming disheartened by the never-ending vista of barrack life, and despairing of being able to have his wife and children with him, he sent in his resignation, to take effect 31 July 1854 and returned to St. Louis.

His father-in-law, Frederick Dent, who lived about 10 miles out of St. Louis, set aside some 60 or 80 acres of land for his use, and thereon he built with his own hands a log cabin, which he called «Hardscrabble.» For nearly four years he lived the life of a farmer. He plowed, hoed, cleared the land, hauled wood and props to the mines, and endured all the hardships and privations of a small farmer.

In the spring of 1860, despairing of getting a foothold in St. Louis, he removed to Galena, Ill., where his father had established a leather store, a branch of his tannery in Covington, Ky. When Galena held a war meeting to raise a company, Capt. Grant, because of his military experience, was made president of the meeting, and afterward was offered the captaincy of the company, which he refused, saying: «I have been a captain in the regular army. I am fitted to command a regiment.»

He wrote at once a patriotic letter to his father-in-law, wherein he said: «I foresee the doom of slavery.» He accompanied the company to Springfield, where his military experience was needed. He mustered in several regiments, among them the 7th Congressional Regiment at Mattoon. He made such an impression on this regiment that they named their camp in his honor, and about the middle of June sent a delegation of officers to ask that he be made colonel. Col. Grant marched his men overland, being the first commander of the State to decline railway transportation. His efficiency soon appeared, and he was given the command of all the troops in and about Mexico, Mo. At this point he received a despatch from E. B. Washburne, congressman for his district, that President Lincoln had made him brigadier-general.

In February 1862, with an army of 20,000 men and accompanied by Commander Foote's flotilla, he took Fort Henry and marched on Fort Donelson. On the 16th of the same month he had invested Donelson and had beaten the enemy within their works. Gen. Simon Buckner, his old classmate and comrade, was in command. He wrote to Grant, asking for commissioners to agree upon terms. Grant replied: «No terms except an unconditional and immediate surrender can be accepted. I propose to move immediately upon your works.» Buckner surrendered, and Grant's sturdy words flamed over the land, making him «Unconditional Surrender Grant.» On 6 April the Federals at Shiloh or Pittsburg Landing were attacked by a large Confederate force commanded by Gen. A. S. Johnston, and beaten back to the Tennessee with heavy loss. Grant, having reformed his lines and been reinforced by Buell, renewed the battle on the 7th, and the Confederates, who, Johnston having been killed, were commanded

ULYSSES SIMPSON GRANT,

EIGHTEENTH PRESIDENT OF THE UNITED STATES.

by Beauregard, were driven from the field. In January 1863 Grant began to assemble his troops to attack Vicksburg, but high water kept him inactive till the following April. Corinth was occupied on 30 May and on 3 July Pemberton at Vicksburg surrendered the largest body of troops ever captured on this continent up to that time, and Grant became the "man of destiny" of the army.

He was made commander of all the armies of the Mississippi, and proceeded to Chattanooga to rescue Rosecrans and his beleaguered army. In a series of swift and dramatic battles he captured Lookout Mountain and Missionary Ridge. The victory at Chattanooga opened the way for Sherman's march into Georgia, and practically closed the war so far as the West was concerned. In February 1864 Congress created and conferred upon Gen. Grant the rank of lieutenant-general, and the following month he assumed command of the armies of the United States, and immediately put himself in position against the army of northern Virginia commanded by Gen. Robert E. Lee. In the bloody campaign that followed (See WILDERNESS, THE BATTLE OF THE) slowly and inexorably Grant forced Lee and his army back upon Richmond. Petersburg fell on 2 April, and Richmond on 3 April; on 9 April 1865 Lee surrendered at Appomattox, and, Sherman having consummated his victorious march to the sea, the war was ended. Grant's terms with the captured general and the Southern army were so generous as to win the respect and admiration of the Southern people. Grant now returned to Washington. In 1866 he was promoted to the rank of general and every honor possible was bestowed upon him. In August 1867, Gen. Grant consented to fill the office of secretary of war *ad interim*, but, the Senate having refused to approve the suspension, January 1868 he surrendered the office to Mr. Stanton.

He was the chief citizen of the Republic at the close of the war, and when Lincoln was assassinated he was the mainstay of the Republic. He became inevitably a candidate for President, and was elected with great enthusiasm in 1868. In 1872 he was re-elected, and during his two terms his one great purpose was to reconstruct the nation. In 1878, two years after his second term had ended, he went on a trip around the world, visiting all the great courts and kings of the leading nations.

In 1880 he was defeated as candidate for nomination for a third term. Shortly after this he moved to New York, and became a nominal partner in the firm of Grant & Ward. His name was used in the business; he had little connection with it, for he was growing old and failing in health. In May 1884, through the rascality of his partner, Ferdinand Ward, the firm failed, and Gen. Grant lost every dollar he owned.

Now came the most heroic year of his life. Suffering almost ceaseless pain, with the death shadow on him, he sat down to write his autobiography for the benefit of his wife. He complained not at all, and allowed nothing to stand in the way of his work. He wrote on steadily, up to the very day of his death, long after the power of speech was gone, revising his proofs, correcting his judgments of commanders as new evidence arose, and in the end producing a book which was a marvel of simple sincerity and modesty of statement and of transparent clarity of style. It took rank at once as one of the great martial biographies of the world.

At his grave the North and South stood side by side in friendship, and the great captains of opposing armies walked shoulder to shoulder, bearing his body to its final rest on the bank of the Hudson River. The world knew his faults, his mistakes, and his weaknesses; but they were all forgotten in the memory of his great deeds as a warrior, and of his gentleness, modesty, candor, and purity as a man. Since then it becomes increasingly more evident that he is to take his place as one of three or four figures of the first class in our national history. He was a man of action, and his deeds were of the kind which mark epochs in history.

Grant University, a coeducational institution in Chattanooga, Tenn., with departments in Athens, Tenn., founded in 1867, under the auspices of the Methodist Episcopal Church; reported at the close of 1900: Professors and instructors, 65; students, 781; volumes in the library, 6,000.

Grants Pass, Ore., city, county-seat of Josephine County; on the Rogue River and on the Southern P. R.R.; in the southeastern part of the State, about 60 miles from the Pacific. It is the commercial centre of an agricultural, lumbering, and mining region; and its chief manufactures are lumber, flour, wood products, machinery for the farms, mines, and for lumbering, and bricks. It has large railroad repair shops. Pop. (1900) 2,290.

Granula'tion Tissue, the tissue formed in wounds to repair loss of substance. Through the clot in a fresh wound certain cells of the blood wander and begin to form new tissue. Blood vessels in tiny loops pass out from the sides of the wound. On the surface these loops form small rounded elevations, spoken of as "granulations." As the process goes on, the new tissue contracts, drawing in the sides of the wound; the skin grows out in delicate points from the margins of the cut. If the granulations pass beyond the surface-line because of irritation, they are spoken of as "superfluous" granulations or "proud flesh."

Gran'ville, Granville George Leveson-Gower, 2D EARL, English statesman: b. London 11 May 1815; d. there 31 March 1891. He was educated at Eton and Oxford; entered Parliament in 1836 for Morpeth, afterward for Lichfield, both in the Liberal interest. In 1855 he became president of the council, and ministerial leader of the House of Lords (1855–8). From 1859 to 1866 he was again president of the council, having previously failed to form a ministry under himself as premier. In 1868 he was colonial secretary under Gladstone, and in 1870 succeeded to the secretaryship for foreign affairs, which he held until 1874. During this period he negotiated the Treaty of 1870, guaranteeing the independence of Belgium, and "protested" against the Russian repudiation of the Black Sea clause of the Treaty of Paris. On the return of Gladstone to office in 1880 he was foreign secretary until 1885.

Granville, N. Y., village, in Washington County; on the Delaware & H. R.R.; about 37 miles northeast of Saratoga Springs and 57 miles northeast of Troy. The village is in an agricultural section, but nearby are valuable slate and building-stone quarries. The slate is

used for mantels, roofing, and marbleized slating. The trade of the town is in stone and slate from the quarries, butter, cheese, hay, and vegetables. Population of the township of Granville, which includes several small villages, (1900), 5,217; of the village of Granville (1900), 2,700.

Granville, Ohio, a village in Licking County, on Raccoon Creek, and on the Toledo & O. C. R.R., about 25 miles northeast of Columbus. It has agricultural and manufacturing interests, but is chiefly noted for its educational institutions, which include Denison University (Baptist), and the Shepardson College for Women. Pop. (1900) 1,425.

Grape Culture. The grape is believed to be the oldest of our cultivated fruits. Although some 1,500 varieties of grapes are cultivated in Europe, they are practically all from a single species of the vine, known as the *Vitis vinifera.* It is supposed to have been indigenous to Asia, where it was widely planted by different peoples centuries before it was introduced into Europe. The Phœnicians have the credit of introducing the culture of the vine into Europe, first into the islands of the Grecian Archipelago and thence into Greece and Italy. The Romans carried vine culture, as a part of their civilization, wherever they settled. Thus, the vine had become well rooted in the south of France, in the neighborhood of Marseilles, at the beginning of the present era. Its culture during the next 200 years spread northward.

The native grapes of America are of entirely different types from the European kinds. The reason is that they come from different species of vines. So that in America, we cultivate two distinct types of grapes: (1) the native varieties, which are indigenous to the country; and (2) the vinifera, or European kinds, which have been transplanted here, and thrive out-doors only on the Pacific coast.

The vine and its cultivation engaged the attention of early colonists, who were encouraged by the authorities and by the lawmakers. The Virginia Assembly passed an act awarding premiums to successful grape growers. When the second charter was granted to Rhode Island by Charles II. in 1663 it contained an inducement to anyone who would plant a vineyard. Queen Christina in her instructions to John Printz, governor of New Sweden, urged that vine growing be encouraged, and she instructed the governor to give the matter his personal attention.

Many of the immigrants to the different colonies came from noted vineyard districts of the Old World. It was only natural that they should try to introduce here the cultivation of those European vines with which they were most familiar. Thus, most of the early attempts to establish vineyards for profit were by foreign, or foreign-born settlers. In 1792 or 1793 Pierre Legaux, a Frenchman, interested a number of Philadelphia gentlemen in his enterprise, and a company was incorporated for the purpose of planting vines. A vineyard was set out at Springmill, near Philadelphia, on the Schuylkill River. Foreign varieties of grapes were tried, but the experiment proved a failure.

About the same period (1790–3) a colony of Swiss grape growers from about Lake Geneva raised a fund of $10,000 and vineyards were planted in Jessamine County, Ky. Foreign varieties of grapes were tried, as had been done previously, but they all ran out and perished. Some years later, or about 1802, certain members of the Swiss colony removed to a place which they called New Switzerland (now Vevay, Indiana), on the Ohio River, 45 miles below Cincinnati. After failing with the best grapes imported from Switzerland, they tried a native variety called the "Cape," or the "Alexander" grape, and they then met with some success. This was largely due to the skill and experience of one member, John James Dufour, who joined the colony about 1805. He was an intelligent and observing vine-dresser, and afterward wrote a small treatise on grape culture and wine making — one of the first books on the subject published in this country. Dufour produced wine, which had a fair sale in the West, but by 1835 or 1840 the wines of Vevay were little heard of, and a few years later the vineyards had nearly disappeared.

Such, in brief, were the leading attempts to introduce the cultivation of European grapes into the Eastern States, beginning in 1620; not one lasting success is recorded.

However, in 1851 the European grape was being grown with success about the different missions. The popular variety was a kind now known as the "Mission grape," which is extensively cultivated in Southern California to this day. Other and better of almost all the leading varieties of European vines have been planted in that State, and their cultivation was a success from the beginning. Our native grapes grow there also, but they are not cultivated to any extent west of the Rocky Mountains. Therefore, grape culture, especially in California, constitutes a separate chapter in American viticulture.

The Cultivation of American Grapes.— After experience had shown that European varieties of grapes would not thrive, practical horticulturists began to turn their attention to the native vines found growing wild, or partially cultivated. They saw that success lay in that direction. But the trouble was to obtain a native grape of superior quality for the table and for wine.

In 1819 Maj. John Adlum noticed a vine growing in a garden at Georgetown, D. C. The grape struck him as having many excellent qualities. He first supposed it to be a European variety, but the grape was really a native of North Carolina, where it was discovered in 1802, and it took its name from the Catawba River. Maj. Adlum was enthusiastic in his estimate of the value of the Catawba grape. In a letter, written shortly before his death to the Hon. Nicholas Longworth of Cincinnati, Ohio, he says: "I have done my country a greater benefit in introducing this grape than I would have done if I had paid the national debt."

There is no doubt that the Catawba grape has played an important part in the grape and wine industry of the United States. This was largely due to the heroic efforts of Nicholas Longworth, who is called "the father of American grape culture." He spent 40 years or more of his life and $200,000 in establishing vineyards in the Ohio Valley, and his wine cellars at Cincinnati, Ohio. His persistent effort to make the industry a success is a fine example of American energy and enterprise. Longworth

obtained thousands of vines from Bordeaux and Burgundy, from the Rhine district of Germany, from Madeira (6,000 vines), and from the Jura (7,000 vines) in hopes of finding grapes which would thrive in his Ohio vineyards. He also tried native grapes, but most of these were given up for the Catawba, which he first received from Maj. Adlum in 1825.

Not only as a pioneer, but as a leader in grape and wine growing, Longworth exercised great influence on the industry. Many able and practical men in Cincinnati became interested in grape culture and, in 1848, the Cincinnati Horticultural Society estimated that within 20 miles of the city more than 1,200 acres were planted in vineyards. During the next three or four years, some six or eight wine cellars were established at Cincinnati. Longworth had two. At his cellars dry and sweet wines were made, and "sparkling Catawba"— the latter produced by fermentation in the bottle after the method of French champagne. It was after a visit to Mr. Longworth that the poet Longfellow wrote his celebrated poem on 'Catawba Wine.'

In 1858, Erskine made a report to the British government on the extent and condition of viticulture in the United States. He gave the vineyard area of the several States, as follows: 3,000 acres in Ohio; 1,000 in Indiana; 500 in Kentucky; 500 each in Missouri and Illinois; 300 in South Carolina; 200 in North Carolina; 100 in Georgia — a total of 5,600 acres of vineyard in the United States. Even at this time grape culture in the Ohio Valley was on the decline. The vines there were being steadily destroyed by mildew and rot. By 1865, these vineyards, which promised so much pleasure and profit, and on which so much labor and money had been expended, were disappearing, and a few years later the grape and wine industry of the Ohio Valley became a thing of the past.

At that time the methods of successfully treating the two principal fungus diseases of the native vine — mildew and black rot — were not known to our viticulturists. Later on the discovery was made that black rot may be kept almost under control by a preparation of sulphate of copper, called the "Bordeaux mixture"— the cheapest and best fungicide ever introduced. As black rot prevailed from an early date in all the vineyards east of the Rocky Mountains, it was only after an efficient remedy was found that grape culture could become commercially profitable in the various eastern States. In California, on the other hand, the vineyards were rather free from fungus diseases, but there, as in France, the phylloxera began its ravages about in 1875, and has been the worst scourge of the vineyards on the Pacific coast since then.

The Growth of Grape Culture in the Eastern States.— About 1865 the grape-growing industry became rooted in the Hudson River Valley, the lake regions of central and western New York, and in northern Ohio, and on the islands in Lake Erie. New York, Ohio, and Missouri are the leading States in the order named. Then come Virginia, North Carolina, Indiana, Illinois, and Kansas. There are small vineyard districts comprising from 500 to 1,500 acres in Georgia, Florida, New Jersey, Michigan, Kansas, Tennessee, and many other States.

The grape industry of the Hudson River Valley was fairly established in the early sixties. Here, the Isabella grape was the leading variety. Like the Catawba, the Isabella is regarded as a native of North Carolina. About 1810 a vine was sent from the South to Col. George Gibbs, who planted it in his garden at Brooklyn, N. Y. A few years later, one of the successful pioneer viticulturists of this country, William Prince, of Long Island, N. Y., introduced this variety to growers, and he named it the "Isabella" in honor of Mrs. Isabella Gibbs. For a long time the Isabella was the standard grape in the New York vineyards, but of late years it has given place to other varieties.

Several varieties of grapes of good quality originated in the Hudson River district. Perhaps the most desirable kinds were the Iona, and the Eumelan. The former was originated by Dr. C. W. Grant, of Iona Island, N. Y. With the Delaware it is considered one of the finest flavored grapes of American origin. The Eumelan is more for wine making than for eating. The vineyards of the Hudson River district in 1890 comprised about 13,000 acres. Since then the industry has gone backward, and at the present time the vineyard area is estimated at from 8,000 to 9,000 acres. There are one or two wine cellars in this district, but about 80 or 90 per cent of the grapes raised along the Hudson River are sold for table purposes.

The Lake Keuka District.— Small plantings of vines were made at Hammondsport, N. Y., at the head of Lake Keuka, from 1850 to 1860. But it was not until after 1865 that the grape industry there began to assume some commercial importance. In 1890, when the statistics of viticulture were gathered for the first time in the United States, there were more than 12,000 acres of bearing vines in the Lake Keuka district, and the growers shipped 20,000 tons, or 40,000,000 pounds, of table grapes to market annually. In addition to that amount, some 5,000 tons of grapes were sold to the local wine cellars. The vineyard acreage in this section did not continue to increase so fast, and in 1903 there were in the district 15,000 acres of vines.

The vintage begins usually the first week in September, when the early varieties (such as the Concords and Delawares) ripen. It lasts until the middle of October, when the last of the Catawbas are gathered. The crop is picked in boxes, which hold from 35 to 40 pounds. The clusters of fruit are cut from the vines by grape shears. When the boxes are filled they are carried to the end of the rows, where they are gathered two or three times a day and taken to the packing-house. Here the grapes are sorted, and packed in 5- and 10-pound baskets. This work is done mostly by women and girls.

The bulk of the grape crop is shipped by fast freight to the large city markets — to New York, Boston, Philadelphia. Within the past few years new markets have been opened in the Far West, and now it is common to find New York State grapes for sale in Denver, Omaha, Kansas City, and even in Manitoba. The experiment was tried of shipping grapes to England, but while the fruit arrived there in fair condition, the cost and prices received did not warrant making further efforts.

The Lake Keuka grape growers now have a long range of season — that is, they can supply table grapes from early in September till the fol-

lowing March and April. The early varieties cannot be held very long, but the Catawba, for example, which ripens late, is a «good keeper.» The grapes are stored in crates or trays in a cool building or cellar, and by proper ventilation and by maintaining an even temperature they can be kept fresh and fair till spring. Some years ago the only grapes in market in mid-winter were hothouse grapes, which cost from 50 cents to $1.50 a pound. Now these outdoor-grown grapes can readily be bought in January or February at 5 and 10 cents a pound.

The wine industry has also made striking progress in the Lake Keuka district. From the 2 or 3 cellars the number has increased to 12 at or near Hammondsport, N. Y. This section of New York State is often called «the American champagne district,» as it produces about two thirds of all the champagne made in the United States.

There are two important areas of vineyards adjoining the Keuka district, namely, the Seneca Lake district of about 5,000 acres of vines in Seneca and Schuyler counties; the Canandaigua district of about 3,000 acres of vineyard bordering on Canandaigua Lake.

The Chautauqua Grape Belt.— This is the greatest single strip of vineyard in the United States. It stretches from the hills surrounding Chautauqua Lake in western New York, along the shore of Lake Erie for some 50 miles. There are about 25,000 acres of vineyard in this belt. The growth of grape culture in the Chautauqua district was remarkably rapid. The industry began about 1860. It grew and prospered, and in 1900 the Chautauqua grape belt contained about 25,000 acres of vines. The annual yield of this district is about 4,000 carloads of grapes. Each car holds from 2,300 to 2,500 baskets. In addition, probably one third, or more, of this amount is used to make wine. The making of unfermented grape juice has become quite a large and growing industry in the Chautauqua district.

The bulk of the crop (about 80 per cent) is handled by an association of growers. The grapes are graded according to their quality, and the returns from the shipments are «pooled.» Each grower gets his pro rata share, after deducting expenses. About 85 per cent of the grapes grown in the Chautauqua belt are of the Concord variety.

The Northern Ohio Vineyards.— Soon after the decay of grape culture in the Ohio River Valley, about Cincinnati, the industry became established in northern Ohio along Lake Erie. Here, the Catawba grape, which was destroyed by fungus diseases in the former locality, survived and soon became the leading variety. There are large stretches of vineyards all along the Lake Erie shore from Ashtabula to Sandusky. There are also several islands in Lake Erie covered with vines; of which Kelley's Island and Middle Bass Island are the best known. The total area of these vineyards in northern Ohio is estimated at from 8,000 to 10,000 acres. From several towns in the northern tier of counties in Ohio, large quantities of table grapes are shipped, principally to western markets. The average crop from the Euclid or Cleveland district has been about 1,500 carloads. The yield about Sandusky and on the Lake Erie islands is mostly taken by the wine cellars.

Summary.— In the districts above described, the growing of grapes (both for the table and for wine making) is regarded as the chief industry. There are considerable vineyard areas in several of the southern and of the western States, and these may become important in the near future. New sections are being planted to vines from time to time; for example, of late years there has been quite an increase of vineyards in southern Michigan, and in the Ozark Mountain region of Arkansas and of southwestern Missouri.

Of American grape culture east of the Rocky Mountains two things may here be noted: First, although some 800 varieties are grown and flourish, yet the bulk of the crop in the leading districts consists of only two or three varieties, namely — the Concord, Catawba, and Delaware; secondly, two thirds of the grapes raised in the East are sold and used for table purposes, while only one third of the crop is made into wine. It is just the reverse in California, for there two thirds of the grape crop is turned into wine, the balance being used for raisins and the table. Therefore, not only in the fact that practically all of the grapes are foreign or European varieties, but in making wine the leading product of the vineyard crop in California is sharply defined from the industry east of the Rocky Mountains.

Grape Culture on the Pacific Coast.— Mention has already been made of the Spanish Fathers, who planted small patches of vineyards about their missions in southern California as early as 1770. The first plantings were at the mission of San Gabriel, and in the course of the next 75 years there were vineyards of from 5 to 25 acres extending from San Diego north as far as Sonoma County. The missions were abolished and their property confiscated in 1845.

The early settlers who began pouring into California in 1849 were more interested in gold than in grapes, and it was not until the year 1858 that a genuine and widespread interest in grape growing arose in the new State. During the next three or four years many vineyards were planted, and the industry began to attract considerable attention, so much so that, in 1861, Gov. Downey was authorized by the legislature to appoint three commissioners «to report upon the best means and ways to promote the improvement and culture of the grape vine in California.» One of the commissioners appointed was Col. Agoston Haraszthy, who, by his writings and his efforts, was largely responsible for this renewed interest in grape culture. He went to Europe, visited the leading vineyard districts there, and secured 100,000 vines embracing 1,400 varieties. These vines and cuttings were distributed from time to time in small lots to growers in different parts of California, and they formed a basis for the viticultural industry in that State.

The first, or experimental, era of the young industry may be said to go from 1861 to 1871. During this period the most popular grape was the old «Mission.» It was hardy, vigorous, and a good bearer. The «Mission» yielded a dry wine of rather inferior quality, which for some years prejudiced dealers and buyers against the Californian product. It will, however, produce a sweet wine, of the sherry type, of good quality.

After a while it was demonstrated that the fine wine grapes of Europe would succeed and

flourish in different parts of California. And then French, German, and Italian vintners turned their attention to the vines they knew or had grown in the Old Country.

After 1871 grape growing in the State began to go backward, and this continued till 1879, when there came a "turn" in the industry. There was a short crop that year; the prices for grapes and wine went up, and soon there was renewed interest in viticulture. In response to a demand, a State Board of Viticulture was created in 1880. The board was composed of able and practical growers from the leading districts of the State, and their work resulted in a revival of the industry.

According to the census of 1890, there were then in California 155,272 acres of bearing vines; the output of wine that year amounted to 14,626,000 gallons. The wine crop reached its height in 1897, when it was 34,000 gallons. The dry and sweet wine production of California for 1902 is put at 28,000,000 gallons. The assessors' returns for the present year (1903) show a total area of vines in California of 230,675 acres, of which 118,209 acres are in wine grapes, and 89,792 acres in raisin grapes, and the balance table grapes. See RAISIN INDUSTRY, AMERICAN.

The shipping of California table grapes to the eastern markets now amounts to about 1,200 carloads. The California shippers of table grapes labor under the difficulty of long distance from their markets. They have fine, beautiful varieties of grapes, but many of them will not stand the journey to the eastern markets.

The leading varieties of California table grapes are: Flame Tokay, Emperor, Cornichon, Black Malvoisie, Rose of Peru, Muscats, Thompson's Seedless, the Chasselas varieties.

Practical Side of Grape Culture.— The practical part of vine-growing can not be learned from books, but is the result of hard work and years of experience. However, some of the more important features of vine cultivation may be mentioned. Of course, climate, location, and soil play an important part in the yield and in the quality of the fruit. From early times the vine was generally set out on the hills with southern or eastern exposure. It is another curious fact that the leading grape districts of Europe and of the United States are located near a body of water. It is so in the great Medoc district of France, situated between the rivers Garonne and Gironde, and in Germany along the river Rhine. In the eastern States we have the leading districts along the Hudson River, on the banks of Lake Keuka in central New York, and along the shores of Lake Erie in northern Ohio. Such large bodies of water keep the vines from late spring or early fall frosts, and from heavy dews and fogs.

Propagation.— The propagation of the vine may be accomplished by seeds, cuttings, layers, and grafts. The wild grape grows from, and multiplies by, the seed only. It reproduces itself, and its seedlings differ seldom from the parent vine. But, if we take the seed of the cultivated vine, the seedlings show a wide variation, and that is seldom wanted, unless as an experiment to obtain new varieties. The usual method of vine propagation is by cuttings, which are made in the winter from the trimming of the vines. The cuttings are planted early in the spring, after the ground is thoroughly well prepared. It is usual to let the plants grow one or two years. The methods of transplanting these vines are various, due to the nature of the vines and to the methods followed in the various districts. Thus, in California rooted vines of one year are preferred; in the eastern States growers prefer two-year-old transplanted vines.

Grafting.— The grafting of the vine, as with other woody plants, is quite easy, although it may be done in a number of ways. The time to graft is early in the spring before the sap starts. Fully a dozen methods have been named and described. The two kinds in most common use are the ordinary cleft or shoulder-graft, and the English or whip-graft. An ordinary graft is simply done by cutting the vine off three or four inches below the surface of the ground, then split with a grafting chisel, and held open with a wedge until the scion is fitted exactly into place. The cleft may be tied with a string, or covered with clay or grafting wax, and then the earth is heaped about the graft, leaving one bud of the scion above the surface. Grafting is of great importance to every vine grower in Europe and in California. For it is by grafting European vines on American stock that they can be protected from that dread scourge, phylloxera.

Pruning and Training.— The value of removing a portion of the vine, and other woody plants, was recognized at a very early date. Most of our native grapes are more vigorous growers and show a greater tendency to climb and spread than do the European vines. Pruning relates to the removal of such parts of the vine as ensures better fruit and larger yield. The general principles of pruning are practically the same for all vines, and these principles as given by Prof. L. H. Bailey are: (1) Fruit is borne on wood of the present season, which arises from wood of the previous season; (2) a vine should bear only a limited number of clusters, and (3) the bearing wood should be kept near the original trunk or head of the vine. Thus, the wood is constantly renewed, and new shoots which give wood, or canes, for the following year, are called "renewals."

Training relates to the form and disposition of the different parts of the vine. It is not necessary to describe the different methods of training. Each large vineyard district has its own system.

Brief mention may be made of the three well-known ways of training the native vine outside of California: (1) The so-called "Kniffin system" first obtained in the Hudson River district. The vine is allowed to grow at will the first season after planting; the second year it is cut back two or three buds from the ground, and from the stub only one shoot is allowed to grow. This is tied to a stake, at intervals, as it grows, to keep it straight to the height of the trellis. In the third year posts are set about 16 feet apart between every two vines. Two wires are then stretched along the posts, the upper wire about five and a half feet above the ground, and the lower one about half way between the upper wire and the ground. The vine is now tied to each wire, and cut off even with the upper one. The next year all the buds on the vine are rubbed off, except four — two for each wire. The two arms on the top wire are often bent down to the second wire, thus forming a droop, and the system is known as the "drooping system" of training.

(2) The Chautauqua system of vine training, as it may be called, is largely used in the vineyards of that district. In the first year the vine is cut back to three or four buds. The second year it is cut back to five or six buds, and three of the strongest shoots are left to grow the fruit-bearing arms for the third year. The trellis consists of three wires. Each year three or four of the strongest new canes are trained upon the trellis spread out in a fan shape.

(3) The Munson system of vine training is named after T. V. Munson, of Texas, a prominent viticulturist and is adapted to the native vines of the southern States. The trellis used is little different from that of the other systems. Thus, the posts are set about 24 feet apart, and carry two lines of wire. The vine is pruned back in the first year, and the next year the two arms may be allowed to bear a few clusters, if the vine is strong. The «bearing arms» are then cut back to 1 or 2 eyes each; the other arms to 8 or 10 eyes. These arms bear the next year, and are pruned for the third year quite short, while the bearing arms for the next year are pruned long. By this system of training there is a shifting of the bearing canes from one side of the vine to the other; all of which, it is claimed, gives vigor to the vine and a good distribution of the fruit.

Diseases of the Vine.— These are caused by animal and vegetable parasites. Of the former the worst and best known is the phylloxera. An American entomologist, the late Prof. C. V. Riley, discovered that some of our native American vines, were infested by phylloxera, but they successfully resisted its attacks. He therefore recommended to the French and other growers of European grapes, that they graft their vines on American stocks. This proved to be the solution of the problem, and practically all of the millions of vines planted in France during the past 25 years, are on «resistant stocks,» or American species of vines. It is the same in California, where the vineyards destroyed by phylloxera, have been and are being replaced by vines grafted on American stocks. The main thing now is to get the right «resistant vines» for different soils and different climates. The other insect pests are the grape leaf-hopper, the root-worm, the flea-beetle, thrips, rose-bug, etc.

The leaf- or vine-hopper often does considerable damages in the vineyards of the East as well as in California. The best remedy so far recommended is a solution of whale-oil soap applied in a spray. The root-worm is at present working in the vineyards of Chautauqua and in northern Ohio. Two or three sprayings of arsenate of lead during the season is recommended, but thorough cultivation is regarded as the best check to the root-worm. See Insecticides.

The leading vegetable diseases of the vine are mildew, black rot, oidium, anthracnose, anaheim, etc. The effects of mildew are seen on the leaves, stem, and the fruit. This disease is indigenous in this country, and first appeared in 1878 in Europe, where it spread over the vineyard districts, France, Germany, Italy, and Spain, doing great damage.

Black rot was also introduced into Europe from the United States, but there it was not as serious as with us. The rot first affects the leaves and then passes to the fruit. The condition most favorable for the spread of both mildew and black rot is warm, moist weather. See Fungi and Fungicides.

The Evolution of American Grapes.—It should be noted, in conclusion, that the development of American grape culture has been a process of evolution with a survival of the fittest. Thus, the improvement in the quality of our native grapes has been something remarkable. It represents the difference between the wild grape — coarse, harsh, and often disagreeable in taste and smell — and the cultivated grape — tender, luscious, and sweet and delicate in flavor.

The botanists have described and put American grape vines into some 12 or 13 groups or classes. Only 4 American species of vines have been cultivated and developed to any extent, as follows: (1) *Vitis Labrusca;* (2) *V. Estivalis;* (3) *V. Riparia;* (4) *V. Rupestris.*

The *V. Labrusca* is generally known as the «fox grape,» and is a native of the Atlantic slope from New England to South Carolina. The largest number of varieties of grapes in all the Eastern States now cultivated spring from this species, which includes the Concord, the Catawba, etc.

The *V. Estivalis* is the «summer grape» of the Middle and Southern States. Several varieties (such as the Lenoir or Jacquez, Herbemont, Cunningham, etc.) have been much used in France and in California as a grafting stock.

The *V. Riparia* is the grape vine of the river banks, and is found growing wild from Canada to the lower Mississippi Valley. This species is very highly regarded in France and California as a stock on which vinifera vines have been grafted with success.

The *V. Rupestris* is native of the country west of the Mississippi River from Missouri to Texas. The varieties of this species have not been much cultivated, but are used, almost exclusively, as resistant stocks in France and in California.

Thus far, the efforts of our horticulturists to develop and improve many new varieties of American grapes has been confined to a few species. In 1830 William Prince enumerated but 88 varieties of native grapes; to-day there are more than 800 kinds. Already they have accomplished splendid results by cultivation, and by hybridizing our vines with the best foreign kinds. We may look in the near future for the production of many choice grapes which will combine all the vigor, beauty of foliage, and resistance to disease of the Labrusca and other American families with the delicate and fine qualities of the vinifera, or European varieties.

Bibliography.— The most complete books on grape culture have been written by the French experts, but their writings do not apply to American grape culture. Among the best books on the subject in French we may name the following: Guyot's 'Etude des Vignobles de France,' 3 vols., Paris 1876; Foex's 'Cours complet Viticulture,' Paris 1875, and Coste-Floret's 'Les Travaux du Vignoble,' Paris 1898. The leading journal is the 'Revue de Viticulture,' published at Paris.

Books on American or Eastern Grape Culture: Fuller, 'Grape Culturist,' New York 1866; Mead, 'Treatise on American Grape Culture,' New York 1867; Husmann, 'American Grape-Growing and Wine-Making,' New York 1896. The most complete account of our native wines

is found in the 'Descriptive Catalogue of American Grape Vines,' by Bush & Son & Meissner, 4th ed. St. Louis 1895. Consult also: Prof. L. H. Bailey, 'Evolution of Our Native Fruits'; the reports and bulletins of the United States Department of Agriculture.

Books on California Grape Culture: Husmann, 'Grape Culture and Wine-Making in California,' San Francisco 1880; E. J. Wickson, 'California Fruits'; Hyatt, 'Grape Culture and Handbook for California'; Wait, 'Wines and Vines of California,' San Francisco 1889; also the reports of the Board of State Viticultural Commissioners of California, 1881–1893. See VITICULTURE; WINE-MAKING.

LEE J. VANCE,
Editor 'American Wine Press,' New York.

Grape Ferns. See FERNS AND FERN ALLIES, *Ophioglossales.*

Grape, or **Globe, Hyacinth.** See HYACINTH.

Grape Insect-pests. More than 200 species of insects have been observed preying on the grape-vine in America. The principal pest is the phylloxera (*Ph. vastatrix*), which first attracted attention by its ravages in the vineyards of France about 1865. It now occurs in vine-growing countries all over the world, and is the worst of the very few insect-pests that have emigrated from America. It caused the destruction of 2,500,000 acres of vineyards in the United States in 1884. The phylloxera is a minute brownish plant-louse of the aphid family. (See APHIS.) The winged females appear in Europe from August to October. Each lays about four parthenogenetic ova on the under surface of the vine-leaves. These ova develop in late autumn into males and females — wingless and without the characteristic piercing and sucking mouth-organs — which migrate to the stem of the vine. There each female lays a single egg under the bark. This egg lies dormant throughout the winter, and develops in April or May into a wingless but voracious "vine-louse." This form may pass to the leaves, on which it lays parthenogenetic eggs, and forms galls; but in Europe it attacks the roots, and lays its eggs there. From these in about 8 days young develop, which become mature females in about 20 days, and lay more eggs in the roots. Half a dozen or more of these parthenogenetic generations follow in rapid succession throughout the summer. The roots become knotted and deformed; the whole plant suffers, and, though it may survive for several seasons, eventually dies. In midsummer, among the subterranean forms, a generation is born whose members, after four, instead of the usual three, moltings associated with adolescence, become the larger winged females with which we commenced.

The destruction of this scourge of the grape-vine, without also injuring or destroying the plants, has proved exceedingly difficult when attempted upon a large scale, where the expense prevents the use of chemicals or methods effective in a small garden. Water, wherever it can be applied to the soil so as to saturate and keep it saturated for a time, has proved a safe and effectual destroyer, because the insect cannot live in a medium saturated with water for long. Chemical remedies, such as bisulphide of carbon, have succeeded, when injected into the soil about the roots. In some of the French vineyards grafting the cultivated vines on certain of the native vines of America has been tried with some success. Although the insect seems to feed on the roots of these vines, the greater vigor of the American stocks appears to enable them to resist the injuries inflicted on them.

An important vine-pest in certain parts of the United States is the grape root-worm (*Fidia viticida*). Injury is chiefly due to the work of the larvæ or "root-worms," but the beetles also injure the plants by gnawing many holes in their surfaces. The larvæ may be destroyed with bisulphid of carbon injections in the soil about the roots; or better by saturating the soil with kerosene emulsion, 10 times diluted, and systematic spraying. One of the most troublesome enemies of the vine is the rosechafer (*Macrodactylus subspinosus*), which is best kept in subjection by planting trap-crops of plants bearing white flowers which blossom at an earlier date than the grape, such as white rose, blackberry, spiræa, and deutzia. The grape-vine flea-beetle (*Haltica chalybea*) does considerable damage at times to grape leaves, but can readily be destroyed with an arsenical spray, and may also be caught in the same manner as the plum curculio, by jarring the insects on to collecting frames saturated with kerosene. Nearly everywhere leaves will be seen drawn together and slowly assuming a brownish hue, and when these are opened a small caterpillar will be found actively wriggling about. This is the grape leaf-folder (*Desmia funeralis*). When vines are sprayed for leaf-feeding insects some of these leaf-folders will be destroyed, but picking and burning the affected leaves is more effective, taking care that the larvæ do not escape to the earth during the process. Leaf-hoppers do much injury in some localities, particularly on the Pacific coast, and several other important enemies of the grape are known, including cutworms, which climb and defoliate vines at night, the grape-berry moth, which destroys the berry, and the grape curculio, which has the same habit. Consult: Cornu, 'Etudes sur le Phylloxera vastatrix' (1879); Lichtenstein, 'Histoire du Phylloxera' (1878); Riley, 'Sixth Annual Report of the State Entomologist of Missouri' (1874); Saunders, 'Insects Injurious to Fruits' (1883); Marlatt, 'Farmers' Bulletin, No. 70,' issued by the United States Department of Agriculture; Bruner, 'Report of the Nebraska State Horticultural Society' for 1895, which gives an extensive bibliography; Riley, 'Third Report State Entomologist of Missouri' (1871).

Grape-shot is a combination of small cannon balls put into a thick canvas bag, and corded strongly together, or fixed in a cylindrical frame, the diameter of which is equal to that of the ball adapted to the cannon. The number of shot in grape varies according to the service or size of the guns, usually, however, a round of grape-shot consists of nine balls in tiers of three.

Grape-sugar. See GLUCOSE.

Grapefruit, Pomelo, Pomelos, Pumelo, Shaddock, Forbidden Fruit, Fruit of Paradise, a tree (*Citrus Decumana*) of the natural order *Rutaceæ,* native of southeastern Asia, from whence it has been introduced in many warm

countries. It is widely cultivated in the West Indies, California and somewhat in southern Florida. The lemon-colored fruit, which is as large as a large orange, is highly prized for its usually pale yellow or greenish-white subacid lemon-like pulp. Propagation and cultivation are practically the same as for the lemon and orange (qq.v.).

Graphic Method, a pictorial method of representing forces, motions, etc., by lines. Similarly, any other physical quantity, such as temperature, atmospheric pressure, or barometric height, electric potential, etc., may be represented by straight lines. Graphic methods are largely employed in physical investigations as aids to calculation, and for the purpose of exhibiting the nature of the law according to which some phenomena vary. The principal use of this method is to show the mutual variations of two quantities. This we will illustrate by a particular example. Suppose a table is drawn up, in one column of which are the months of the year, and in the other the corresponding average temperatures of the air, at some particular place, during these months (the average temperature for each month being the mean of the daily temperatures). Let two lines, OX and OY, be drawn from O, one horizontally, the other vertically; let the successive months of the year be represented on any convenient scale along OX, and let temperature be measured along OY, also on a convenient scale. Corresponding to each month in the year there will be a length along OX, and to each temperature there will correspond a point on OY. At the middle point corresponding to each month draw perpendicular to OX a line representing the temperature on the scale of OY. A series of lines will thus be obtained, through the upper ends of which there may be drawn, freehand, a smooth curve. The points on the curve in the figure represent the upper ends of these lines. A general glance at such a curve will reveal certain features regarding the temperature of the whole year; at what dates maxima and minima occurred; when the temperature rose or fell quickest, and so on.

Graphite. Graphite is manufactured in large quantities at Niagara Falls from the ordinary forms of amorphous carbon, large quantities of anthracite coal being converted into this product. The present artificial production of graphite amounts to no less than 1,250 tons per annum. The art of converting the various forms of amorphous carbon into graphite was discovered and developed by Mr. E. G. Acheson, to whom the art of producing carborundum is also due.

E. G. ACHESON.

Graph'ophone. An apparatus similar in principle to the Edison phonograph (q.v.), and designed to reproduce human speech and other sounds. It was invented conjointly by Messrs. C. A. Bell and Charles S. Tainter, and differs from the phonograph merely in its mechanical details of construction, and in the employment of a wax-coated cylinder of pasteboard instead of a solid wax cylinder.

Graph'otype, a process of engraving discovered in 1860 by De Witt Clinton Hitchcock, by which the valuable improvement is effected of enabling the artist to be his own engraver. The discovery is utilized in the following manner: French chalk is by a careful process ground to the finest powder, which is repeatedly passed through a wire-cloth with 10,000 holes to the square inch. It is then laid between a smooth plate of zinc and a smooth plate of steel, and submitted to intense hydraulic pressure, after which it is sized to prepare it for the artist. The pencils used by the artist are of sable-hair, and the ink is composed of lamp-black and glue. The drawing, when finished, is gently rubbed with silk velvet or fitch-hair brushes until the chalk between the ink lines is entirely removed to the depth of one eighth inch. The block is then hardened by steeping it in an alkaline silicate, by which the whole of the chalk is converted into stone. Molds are then taken of it, from which stereotype plates are cast for printing. See ZINCOTYPE.

Graptolites, grăp'tō-līts, a name given to fossils, characteristic of the Upper Cambrian, Ordovician, and Silurian strata, now regarded as belonging to the Cœlenterata, and to that class under which the sea-firs (*Sertularia*, etc.) are arranged. They consist of a rod or axis, which appears solid, but may have been hollow during life, and of cells disposed on both sides of this rod. These cells open one above another in the same vertical plane, while, by the other end, they open into a cavity which is common to all the cells on one side of the axis, this common cavity being characteristic of the Hydrozoa. These fossils seem to have been of horny consistence during life, for they are, with few exceptions, found flattened on the surface of shales and never calcareous. They live rooted in the mud; not attached to any object, but simply anchored by their base, like the living sea-pens.

Gras, Felix, fā-lěks, Provençal writer: b. Malemont, near Avignon, 3 May 1844; d. Avignon 4 March 1901. His education ceased at 17, when he returned to his father's farm, from which he was sent, in 1864, to Avignon and articled to Jules Giéia, a man of letters as well as a lawyer, and a member of Félibrige, a Provençal literary club of which Frederic Mistral (q.v.) was a member. Amid such surroundings he accepted law as his profession but resolved on literature as his vocation. In 1876 he published his first important work, an epic poem in 12 cantos, 'Li Carbounie,' which won for him the first place among Provençal writers of the younger generation. 'Toloza,' an epic recounting the crusade of Simon de Montfort against the Albigenses, followed in 1882. He proved himself second only to Mistral among Meridionals by a collection of his shorter poems to which he gave the title 'Lou Roumancers Prouvençal' (1887). In his collections of prose stories, 'La Papalmo' (1891), he fancifully describes, in vivid, racy style, the loves and hates, sensuality and «superstition» of the papal court at Avignon. His greatest popular success, 'Li Rouge dóu Miejour' (1896), was published in a translation, 'The Reds of the Midi,' before it saw the light in France, where it is not so popular as among those who read it in the English version alone. A more recent work, which has been translated in the United States under

the title 'The White Terror,' describes the retaliatory violence of the Royalists in the south, when the storm of the Revolution had swept by. For 10 years previous to his death he had been Capoulié, or president of the Félibrige.

Grasmere, grăs'mēr, England, village, in Westmoreland County; on the lake of the same name. It has been made famous by the "Lake School of Poets," Wordsworth, Southey, and Coleridge. Many places in Grasmere and the surrounding lake country have been mentioned in the poems of the authors who frequented this section, especially by Wordsworth. The graves of Wordsworth and Hartley Coleridge are in Grasmere.

Grass. See GRASSES IN THE UNITED STATES.

Grass, Straw, or Pampas Cat, a wildcat (*Felis pajeros*) of southern South America, common on the grassy plains. It is described by Hudson ('A Naturalist in La Plata,' 1892) as not unlike the European wildcat in its robust form and dark color, "but a longer, more powerful animal, inexpressibly savage in disposition."

Grass-bass, the calico-bass (q.v.).

Grass, China. See RAMIE.

Grass-finch. See VESPER SPARROW.

Grass-pink, or **Calopogon,** a showy orchid (*Limodorum tuberosum*), with a small bulbous root, large ovate leaves, sheathed at the base, and flowers growing in a loose spike upon a slender stem 12 to 18 inches high; they are butterfly-shaped, fragrant and magenta pink; and the lip, which is exquisitely bearded with gay colors, remains on the upper side of the flower, giving the blossom an upside-down appearance. It is common in boggy places from Florida to Newfoundland. Several other species of the genus occur in the South, one of which (*L. multiflorum*) bears many more flowers than does the grass-pink.

Grass-snake. In the United States a greenish unstriped variety of the garter-snake (q.v.). In Great Britain the European water-snake (*Tropidonotus natrix*), which closely resembles our American water-snake (q.v.), but is rather more terrestrial and even arboreal in its habits. It is the only serpent in England except the viper, and does not occur in Ireland or Scotland, but is common all over southern and central Europe, in Algeria, Asia Minor, and eastward to India.

Grass-snipe, a gunner's name for the jack-snipe (q.v.), and some other shore-birds of similar habits.

Grass-tree, the popular name for certain tree-like Australian sedges (*Juncaceæ*). Their large stems are crowned by thick tufts of narrow, pendulous foliage which in turn display cylindrical flower-spikes like exaggerated cat-tails. The plant contains an aromatic resin (Botany-bay gum or gum acaroides) employed in pharmacy, and also used by the natives for a variety of purposes, such as calking canoes, and as a cement or glue. These plants are also called 'black-boys' from the appearance of the stems when charred by fire, and from the fact that the black-skinned natives often use them as a means of concealment, or even imitate the appearance of a charred stem by crouching into a similar attitude, and so escape the eyes of enemies.

Grass Valley, Cal., city, in Nevada County; on the Nevada County Narrow Gauge R.R.; about 3 miles northeast of Marysville. It was one of the first settlements made after gold had been discovered in the State. It is in a rich gold quartz mining region, and the chief occupations are connected with mining. It has granite and marble works, a distillery, and large wineries. Pop. 4,825.

Grass Worm, the caterpillar of a noctuid moth (*Laphygma frugiperda*), which often does great damage to grasses and cereals in the Southern States, and to a great variety of crop plants, as in 1899, when a serious outbreak of this species extended from Mexico to Chicago. In the North it is known as the fall army-worm, from the fact that it appears and travels in greatest numbers in the autumn, devouring nearly every form of vegetation encountered in its line of march.

Grass-wrack, a maritime grass. See EEL-GRASS.

Grasse, François Joseph Paul, frän swä zhō-zĕf pōl grăs, COUNT DE, French admiral: b. Valettes, Provence, 1723; d. Paris 11 Jan. 1788. He first entered the navy of the Knights of Malta, and served against the Turks; in 1749 entered the French navy, became captain in 1762, and rear admiral in 1778, and was appointed to command a squadron sent to the West Indies. In 1781 he was given the rank of admiral and sent with a fleet to coöperate with the land forces in the American colonies. He first assisted at the taking of Tobago, in the West Indies, then sailed to the mouth of the Chesapeake, where he repulsed the attack of the British fleet under the command of Graves, prevented aid from reaching Cornwallis at Yorktown, and cut off his retreat, thus materially assisting the decisive American victory there; for these services he received the thanks of Congress. He then went to the West Indies, where for a time he was successful against the British, capturing the island of St. Christopher; but on 12 April 1782 was surprised by the English fleet under Rodney, and after a hard fight defeated, and taken prisoner. He was accused of carelessness and even treachery, but was exonerated by an official investigation, and at the time of his death held the rank of lieutenant-general of the naval forces of France.

Grasserie, a disease of silkworms (q.v.).

Grasses in the United States. The term "grass" is popularly applied to the green herbage on which cattle and other beasts feed, and thus includes many plants which are not botanically related to the true grasses, such as the clovers, alfalfa, sanfoin, vetches, spurry, etc., frequently referred to as "artificial grasses," while it excludes some of the most important of the true grasses, namely, the cereals. The true grasses constitute the botanical family *Gramineæ*. They are distinguished from related groups of plants in that the leaves are arranged in two opposite rows on the stem, with a single leaf at each joint. The stems (culms) are usually hollow except at the joints, and the base of the leaf forms a sheath which surrounds the stem above the joints. The sheath is usually extended a short distance above the base of the blade of the leaf,

in a delicate, whitish structure closely surrounding the stem, called the ligule, the office of which seems to be to prevent rain-water from percolating between the sheath and the stem. The grass flower usually consists of the following parts: flowering glume, palet, lodicule, one to six stamens (usually three), and a one-celled ovary usually with two styles tipped with plumose stigmas. The flowers are usually arranged in two rows on opposite sides of the rachilla, constituting a spikelet. At the base of the spikelet are usually two empty glumes. The empty glumes, flowering glumes, and palet constitute the "chaff." The spikelet may contain one to many flowers. The lodicule, which stands in front of the flowering glume, is very small, usually not noticeable except on close examination. At flowering time, the lodicule becomes greatly swollen, and by this means spreads the flower open. In spikelets that contain several flowers, the palet, or inner chaff, rests with its back against the rachilla, and is concave on the back, with a nerve or keel on either side. The edges of the palet are overlapped by the edges of the flowering glume, or outer chaff. The spikelets are arranged either in spikes, as in wheat, or in panicles, as in oats. Popularly, these are referred to as the "seed-head," and this term will be frequently used in this sense in this article. The fruit of the grasses is a seed-like grain, either adherent to the chaff, as in barley, or free from it, as in wheat.

This is one of the largest and most widely disseminated families of plants, and by far the most important to mankind. It includes the cereals, wheat, oats, barley, rye, rice, millets, and corn, sugarcane, sorghum, the cane of the southern canebrakes and the bamboo of the Old World, in addition to the common grasses of the fields and prairies. It furnishes the principal food of both man and beast, and some of the most beautiful ornamental plants (reed, Ravenna grass, plume-grass, ribbon-grass, etc.). The grasses are the foundation of agriculture. Their principal development is in the temperate zones, though grasses are found wherever vegetation flourishes. Singularly enough, the most important grasses, the cereal grains, are not known in the wild state, and their cultivation extends so far back into antiquity that even their places of origin are unknown. Either their wild counterparts have become extinct, or the cereals have been so changed by cultivation that their wild forms are no longer recognizable. There are in all about 4,000 distinct species of grasses known. The species of only two natural orders of flowering plants exceed this number, namely, the *Compositæ* and the *Leguminosæ,* though in the number of individual plants the grasses far surpass all others. The total number of grass species growing in the United States is about 1,400; in the limits of the State of Washington about 275 species are found. Originally, nearly half the area of this country consisted of prairies, the principal herbage of which was grasses. The existence of these vast stretches of grass-land has never been fully accounted for. It is not due simply to climatic and soil conditions, for many species of trees readily grow on the prairies when placed there by man. In recent years, vast areas that were formerly occupied by grasses have been invaded by various shrubs and trees, particularly the mesquite tree of the Southwest. This has occurred simultaneously with the destruction of the grasses by stock, indicating that the presence of the grasses is inimical to forest growth. It is well known that grasses thrive best on the more compact soils. On such soils, the abundant growth of grass, with the fires that have swept over these regions in dry seasons from time immemorial, has kept in check those classes of vegetation which could not quickly recuperate after the destruction by fire of their aërial portions. On the coarser types of soil, the sparse growth of grass, and the consequent lack of fuel to feed the fires, has enabled forest trees to become established. These facts, while they do not entirely account for the existence of prairies, are undoubtedly an important element. The prairies are particularly developed in the arid and semi-arid regions where frequent drouth has augmented the destruction occasioned by fires, and particularly on the heavier soils of that region which retain sufficient moisture to enable the grasses to form a complete covering over the soil.

Of the many grasses (popularly known as such) native to this country, or of the introduced grasses that have become established here, comparatively few are of economic importance. Their principal use is as food for live stock. Most of them grow too sparsely to be important for this purpose, and many of them are not nutritious enough to make them valuable as food. A considerable number, however, are both nutritious and palatable to stock. Yet the number of these which are propagated artificially is exceedingly small when compared with the total number of species. This is partly accounted for by the fact that a few species are surpassingly useful by reason of abundant growth, ease of propagation, nutritive value, and palatability. When such a grass becomes established in a region to which it is adapted, the effort to find other valuable sorts in a measure ceases. But there are vast sections of country, particularly in the cotton-producing States and the arid and semi-arid West, where good grasses, adapted to local soil and climatic conditions, have not yet become established as field crops. Not that there are no good grasses known in these regions, for there are many of them; but it happens that these grasses are not easily propagated or have some characteristic which renders them undesirable. The well-known and valuable buffalo grass (*Bulbilis dactyloides*) of the West and Southwest is an example in point. It is one of the most nutritious and palatable of all the grasses, and produces abundant feed; but it produces very little seed, and that only on trailing vine-like stems, from which it is impractical to harvest it. Many of the grasses which formerly constituted important factors on the ranges of the West, and which are eminently adapted to the climatic and soil conditions there, are rendered useless on cultivated lands by reason of their poor seed habits. What the breeder's art may accomplish in rendering these now useless grasses useful, by improving their seed habits, remains to be seen. The leading tame grasses of the country are as follows:

Timothy (*Phleum pratense*).— The acreage of this grass in the United States is twice as great as that of all other cultivated grasses put together. It may be said to be the hay grass of the country. Its supremacy is due first of all to its excellent seed habits. The seed from an acre of it will seed a larger acreage than is the case

with any other grass. The seed is easily harvested, and retains its vitality for several years. It also produces relatively large yields of hay, which, although not so nutritious as the hay from some other grasses, is eaten readily by all kinds of stock. It is particularly valuable for horses, because of its favorable physiological effect on the digestive apparatus. Owners of livery stables, whose horses are liable to be subjected to hard driving after heavy feeding, will feed no other hay when timothy is available. Timothy is usually sown with wheat, in fall, at the rate of about eight pounds of seed per acre, the seed being cast on the bare ground behind the drill-plows. Clover is then frequently added, at the same rate, in early spring, though farmers who raise much hay for sale prefer to omit the clover, as the pure timothy is preferred by horsemen. After the wheat crop is harvested, the grass is ordinarily used for pasture in the fall. The next season a large yield of hay is obtained (one to three or more tons per acre, according to the fertility of the soil), but the yield decreases thereafter to such an extent that the best farmers do not attempt to maintain a timothy meadow for more than two seasons, though such fields are frequently used for pasture for two or three years longer, before breaking them up for corn. In the latter case, bluegrass seed (*Poa pratensis*) is frequently scattered on the timothy sod, so that the pasture consists largely of bluegrass. The production of timothy hay is confined largely to the region north of and including the eastern third of Kansas and Nebraska, and to certain restricted localities in the Rocky Mountains and Pacific coast States; but timothy hay is used almost exclusively by horsemen in the large cities of all sections of the country.

Kentucky Bluegrass, June Grass, or Bluegrass (*Poa pratensis*).— Next to timothy this is the most important grass in this country, though it seldom grows large enough to cut for hay. It is undoubtedly the leading pasture grass in America. Its distribution is nearly identical with that of timothy. It does not extend south of the Ohio River except in a circular area about 100 miles in diameter in Kentucky, with a point 25 miles north of Lexington as a centre; and in certain portions of Tennessee and the mountainous portions of the southern States. In Kentucky and Tennessee its distribution is closely confined to the Cambrian rocks, which are rich in both lime and magnesia. Perhaps no other grass is so acceptable to stock as bluegrass. It is one of the most nutritious of grasses, and it is a notable fact that stock raising has never become a prominent feature of farming anywhere in the United States outside of the bluegrass region, except of course in the range country of the West, where ranching rather than farming is the prevailing form of agriculture. The best bluegrass pastures are those which are kept free from weeds and bushes, not cropped too closely and constantly, and upon which fattening stock are fed grain and mill products. Such pastures last indefinitely, but are hardly productive enough to justify their maintenance except on rough lands not well adapted to the cultivation of ordinary crops. So highly prized are the bluegrass pastures in many sections that they are seldom broken up; for it is a difficult matter to establish a good bluegrass pasture, a process requiring several years.

Millet.— The term millet is applied to three more or less distinct groups of grasses. The more common millets in this country are the foxtail millets (*Chætochloa italica*). They include the well-known foxtail, a common weed springing up in grain fields after harvest, and the hay-producing varieties, Hungarian grass, German millet, golden millet, and a few others, all annuals which produce an abundant crop of coarse hay of rather inferior quality. They are grown mostly as catch crops, being sown in late spring and early summer on fields where other crops have failed because of drouth. They are hence confined largely to the semi-humid region extending from North Dakota to Texas. Millet hay, when fed to horses that have no other roughness, has the peculiar property of producing acute rheumatic affections of the joints; but when fed with other hay, the damage from this source is very slight. Another group of millets, frequently called broomcorn millets, are varieties of the species *Panicum miliaceum*. These are little known in this country, though they constitute important bread-producing crops in central Asia. A third kind of millet, usually known as Japanese millet, is a variety of the common barnyard grass, *Panicum crus-galli*. Some forms of this grass are common weeds all over this country. Some of the varieties produce large crops of coarse but palatable hay, particularly on wet lands in the southern States. The seed of one variety is used for food by certain Indian tribes of the Southwest. Other varieties are similarly used in the Old World. This group of millets probably deserves more attention that it has yet received in this country.

Redtop (*Agrostis alba*).— This grass and its variety *vulgaris* are widely distributed in this country, occupying the whole of the timothy and bluegrass region, and extending considerably farther south; but the only section in which it may be said to hold first place is in a limited area in southeastern Illinois and adjacent parts of Kentucky. In this section, practically all of the redtop seed of the country is produced. It is rather distinctly a wet-land grass, and is usually a valuable constituent of meadows and pastures on moist lands in all parts of the country except the extreme south. In yield of hay it is distinctly inferior to timothy, but it withstands cropping and trampling by stock much better. Although quite nutritious, it is not nearly so well relished by stock as timothy or bluegrass.

Orchard Grass (*Dactylis glomerata*).— In its distribution in this country, this grass is identical with redtop, but it is adapted to drier soils. Particularly in the southern portion of its area, orchard grass flourishes in the shade of trees, hence its popular name. It may be said to be important as a hay grass only in that part of its range which extends beyond the limits of the timothy region. It is particularly important in the clay soils around the base of the Appalachian range from Virginia southward, though it thrives equally well throughout the timothy region. This grass produces a large yield of rather coarse hay, which, however, is of excellent quality if cut by the time the blossoming period is over. If allowed to stand longer, the quality of the hay deteriorates rapidly because of the formation of woody tissue in the stems. A rather serious objection to it is that it is inclined to grow in bunches, making a rough and

uneven surface difficult to mow; yet it is undoubtedly the best of the hay grasses in those portions of its region where timothy does not succeed. It is also an excellent pasture grass, withstanding much hard usage, and furnishing large quantities of herbage. In New Zealand, where this grass is very popular, and in England, it is known as cock's-foot, from the fancied resemblance of its branching seed-head to a chicken's foot.

Bermuda (*Cynodon dactylon*).— With some reservations, it may be stated that what bluegrass is to the North, Bermuda is to the South. The differences are: Bermuda revels in the heat of summer, while bluegrass makes little growth in hot, dry weather. It stands drouth much better than bluegrass. On good land, Bermuda furnishes good crops of hay, which bluegrass does not. Bermuda stands trampling even better than bluegrass, and yields more pasture. On the other hand, Bermuda furnishes pasture only during the warm season; and while it furnishes larger amounts of feed than bluegrass, stock do not relish it quite so well. The seed of Bermuda is also quite unreliable and very high-priced, so that, to insure getting a stand of it, it is the usual custom to plant small pieces of sod, which soon spread over the ground and form a complete covering. One of the most characteristic features of Bermuda is its habit of sending out long runners which run along the surface of the ground, taking root at the joints. This renders it a matter of considerable difficulty to eradicate the grass when it is once established. But this may be done by growing densely shading crops, such as oats in winter, followed by cowpeas or velvet beans in summer, for one or two seasons. A single season of clean culture, such as cotton receives, will then completely destroy the Bermuda. *St. Lucie Grass* is a variety of Bermuda which is found in Florida and near the Gulf coast. It grows considerably larger than the species, and is said to remain green longer in the fall.

Johnson Grass or Means Grass (*Sorghum halapensis*).— This grass was introduced into South Carolina from Turkey near the middle of the last century. In that State it is generally known as Means grass, from Gov. Means, who did much to popularize it. It was later taken to Mississippi by a Mr. Johnson, where it became widely known under his name. The most prominent characteristic of Johnson grass is its habit of producing an enormous growth of underground stems (rootstocks, or rhizomes), from each joint of which a new plant may be produced. It is therefore a matter of extreme difficulty to get rid of the grass when it is once established. It is now very generally distributed over the cotton-producing States, and is the most formidable weed found in the South. It is generally believed that it cannot be exterminated by any practicable means. This, however, is not the case. If the land is thoroughly plowed in autumn, with a disk plow or a good turning plow, the rootstocks dragged from the ground with a good harrow, or better, a root-digger; plowed again in midwinter; then plowed and thoroughly harrowed again in late spring, again removing all the roots possible, a crop of cotton may be grown the following summer nearly free from grass. If then the grass be persistently pulled or cut during the summer, never allowing it to reach a height of four inches, it can be completely eradicated. It is practicable to do this, for very little grass will appear in the cotton, and what does appear will be attached to loose roots easily pulled from the ground. While Johnson grass produces rootstocks in abundance, it spreads very slowly by this means, but spreads rapidly by seed. These are produced in great quantity, are readily eaten by stock, and are thus carried over all parts of a farm on which it has once gained a foothold. Johnson grass usually gives three cuttings of hay in a season, of about a ton each on good land. The hay is of excellent quality, particularly for cattle and for all horses except livery horses liable to be subjected to hard driving after a full feed. In such cases its laxative and diuretic effect becomes objectionable. As a pasture grass it can not be compared with Bermuda, though it is greatly relished by all kinds of stock. It is soon killed down completely when heavily pastured, but when the land is plowed it springs up again.

Brome Grass (*Bromus inermis*).— This is a recent introduction from east central Europe, and on the prairie soils of the Northwest and the Pacific Northwest, it occupies the place that bluegrass holds on the glacial drift of the more humid climate to the East. It is much larger than bluegrass, and hence furnishes more feed. It is much relished by all classes of stock. Stock eat with great avidity the straw from which seed is harvested, and the hay, cut just after the blossoms fall, is of excellent quality. Brome grass forms an excellent sod.

Italian Rye Grass (*Lolium italicum*).— This is perhaps the most important of all the meadow grasses in England and on the continent of Europe. It is relished by stock better perhaps than any other of the cultivated grasses; yet, for some reason not entirely clear, it is almost unknown in America. The only section of the country in which it has gained favor is in northwestern California, western Oregon, and western Washington. It is adapted to a very wide range of soils. It thrives remarkably on land reclaimed from salt marshes by dyking, and it is also a valuable grass on upland soils that are inclined to be dry. Practically speaking, it is an annual, but if properly managed it reseeds itself in such a manner as to be practically a perennial. It is a valuable constituent of all pasture mixtures, and is a hay grass of much value. It is not well adapted to single culture, being rather too weak of stem to stand alone.

English Rye Grass (*Lolium perenne*).— This differs from the last in no essential respect except that it does not grow quite so tall, and is slightly more inclined to a perennial habit. It is an important European grass practically unknown in America.

Tall Fescue and Meadow Fescue (*Festuca elatior*, and variety *pratensis*).— These two grasses differ in no essential particular (from the agriculturist's standpoint) except that the first is taller and more leafy than the second, and therefore more valuable as a forage plant. The smaller form is frequently known as English bluegrass, a name which has led to much confusion, and which should be abandoned. It is not closely related to our Kentucky bluegrass, nor to Canadian bluegrass (*Poa compressa*). Tall fescue is much confused with meadow fescue by seedsmen, and it not infrequently occurs that seed of the latter is sold under the name of tall fescue. This fact has hindered the

recognition of the decided merits of tall fescue. Next to Italian and English rye grass, these two grasses are the most important cultivated grasses in Europe. But like the rye grasses, they have never been recognized as valuable grasses in this country except in a few restricted localities.

Tall Oat Grass (*Arrhenatherum avenaceum*). — This grass is found occasionally in all parts of the country, but is nowhere an important crop. Stock do not eat it readily at first, but soon become accustomed to it, and then eat it freely. It has considerable value both for hay and for pasture.

Cheat, or Chess (*Bromus secalinus*).— In the central and eastern States, cheat is a pernicious weed in wheat fields, and it is popularly believed that, under certain unknown conditions, wheat turns into cheat, and it avails nothing that the fallacy of this notion has been demonstrated time and time again. In some parts of the South, and in the Willamette Valley in Oregon, cheat is sometimes grown for hay. It produces a large yield of rather poor hay. Being an annual, it is of little value for pasture.

Velvet Grass (*Holcus lanatus*).— This grass is common in the Pacific coast region along roadsides and in waste places. On sandy soils along the coast and on peaty soils that dry out in summer. velvet grass is perhaps the most profitable hay and pasture grass, because the better grasses do not succeed. Stock usually refuse to eat it until driven by hunger, but they will soon acquire a taste for it, and it is exceedingly nutritious. Its worst faults are its low yield and lack of palatability.

Canadian Bluegrass (*Poa compressa*).— A grass of small economic value, found quite generally over the northern States and in Canada. It is of some value as a sand binder, and, when kept closely mowed, it forms a smooth, even sod in lawns.

Crab Grass (*Panicum sanguinale*).— This is not, strictly speaking, a cultivated grass. It springs up in cornfields in late summer, and frequently furnishes a considerable crop of hay, which is of fair quality. It is universal in the South and extends northward to the Missouri and Ohio rivers.

Fodder Grasses.— Under this term we may include the coarse-growing grasses such as the sorghums, Kafir corn, Milo maize, teosinte, etc. On account of their large size, they require to be handled in a different manner from the common hay grasses. They are usually cut and shocked after the manner of fodder corn, though most of them may be handled by haying machinery if they are sown quite thick.

The sorghums (saccharine sorghums) were introduced into this country about the middle of the last century, and were extensively grown for syrup making before the now universal adulteration of this class of food materials destroyed the market for all farm-made syrups. At present little sorghum syrup is produced, but the sorghum plant is much grown for fodder. Its most valuable characteristic is its ability to withstand protracted drouth. It is therefore especially adapted to the western edge of the humid region, where it is exceedingly popular. Sorghum is also very generally grown in all the southern States, where the fodder is particularly valuable as a feed for the plantation mules. In all the cotton-growing States, as well as along the edge of the great plains, sorghum is a much more certain crop than corn (maize). Kansas is the leading State in the production of this crop. Some varieties are grown as far north as Minnesota and North Dakota. In the South two or three cuttings may be made in a season.

Several varieties of Kafir corn (non-saccharine sorghums) have become established in this country in recent years. The plant resembles a low-growing, branching, very leafy sorghum. It is cultivated either for fodder or for grain, of which latter it yields abundant crops. The grain is inferior to corn, but its more certain yield in dry seasons renders it a valuable crop in the same sections where sorghum is grown. It is rather more distinctly a southern crop than sorghum, being grown most largely in Kansas, Oklahoma, Texas, and New Mexico. Milo maize is not very widely known in this country, but it is gaining a foothold in parts of Texas, where it is grown after the manner of sorghum and is said to furnish large crops of valuable fodder or hay. Teosinte (*Euchlenea mexicana*) is a tropical plant somewhat resembling sorghum, but in reality more closely related to corn (maize). It does not produce seed in this country, but on rich alluvial soils in the southern States it produces enormous yields of green fodder much relished by cattle. It is of no account on poor thin soils. Near the cities, where dairying is an important industry, this crop is of great value in the South. It may be cut several times in a season, and there is no waste in feeding it, as the stalks are readily eaten.

Pearl millet may be classed with the sorghums on account of its manner of growth, but botanically it is quite different from them. It is a native of Africa, and was introduced in this country about 30 years ago. It has been tried very generally over the country, but has never gained favor. The seed is frequently unreliable, and the stems are inclined to be woody when approaching maturity.

A large number of our wild grasses have more or less economic importance. In fact, a majority of them furnish food for domesticated animals, while some are important for other reasons, as will appear in the discussion below. Only a few, however, are of sufficient importance to warrant their mention here. It is somewhat remarkable that none of our wild grasses have been domesticated during the past hundred years. This is perhaps due to the fact that the best of them were brought into cultivation very early in the history of the country. The more important genera of our wild grasses are:

Andropogon.— This genus is particularly well developed along the eastern edge of the western plains, where several species form important constituents of the immense acreage of wild hay cut in that region; also in the southern States, where it constitutes the major part of the growth of grasses in open woods and abandoned fields. *A. virginicus* is one of the most abundant grasses from Maryland southward. These grasses are large and coarse, and are not much relished by stock except in the early stage of their growth, whence the common practice of burning over the prairies to start a new growth of tender grass.

Agropyron.— This genus is particularly characteristic of the northern Rocky Mountain States, where several species are valuable for forage. They are, as a rule, better relished by stock than

uneven surface difficult to mow; yet it is undoubtedly the best of the hay grasses in those portions of its region where timothy does not succeed. It is also an excellent pasture grass, withstanding much hard usage, and furnishing large quantities of herbage. In New Zealand, where this grass is very popular, and in England, it is known as cock's-foot, from the fancied resemblance of its branching seed-head to a chicken's foot.

Bermuda (*Cynodon dactylon*).— With some reservations, it may be stated that what bluegrass is to the North, Bermuda is to the South. The differences are: Bermuda revels in the heat of summer, while bluegrass makes little growth in hot, dry weather. It stands drouth much better than bluegrass. On good land, Bermuda furnishes good crops of hay, which bluegrass does not. Bermuda stands trampling even better than bluegrass, and yields more pasture. On the other hand, Bermuda furnishes pasture only during the warm season; and while it furnishes larger amounts of feed than bluegrass, stock do not relish it quite so well. The seed of Bermuda is also quite unreliable and very high-priced, so that, to insure getting a stand of it, it is the usual custom to plant small pieces of sod, which soon spread over the ground and form a complete covering. One of the most characteristic features of Bermuda is its habit of sending out long runners which run along the surface of the ground, taking root at the joints. This renders it a matter of considerable difficulty to eradicate the grass when it is once established. But this may be done by growing densely shading crops, such as oats in winter, followed by cowpeas or velvet beans in summer, for one or two seasons. A single season of clean culture, such as cotton receives, will then completely destroy the Bermuda. *St. Lucie Grass* is a variety of Bermuda which is found in Florida and near the Gulf coast. It grows considerably larger than the species, and is said to remain green longer in the fall.

Johnson Grass or Means Grass (*Sorghum halapensis*).— This grass was introduced into South Carolina from Turkey near the middle of the last century. In that State it is generally known as Means grass, from Gov. Means, who did much to popularize it. It was later taken to Mississippi by a Mr. Johnson, where it became widely known under his name. The most prominent characteristic of Johnson grass is its habit of producing an enormous growth of underground stems (rootstocks, or rhizomes), from each joint of which a new plant may be produced. It is therefore a matter of extreme difficulty to get rid of the grass when it is once established. It is now very generally distributed over the cotton-producing States, and is the most formidable weed found in the South. It is generally believed that it cannot be exterminated by any practicable means. This, however, is not the case. If the land is thoroughly plowed in autumn, with a disk plow or a good turning plow, the rootstocks dragged from the ground with a good harrow, or better, a root-digger; plowed again in midwinter; then plowed and thoroughly harrowed again in late spring, again removing all the roots possible, a crop of cotton may be grown the following summer nearly free from grass. If then the grass be persistently pulled or cut during the summer, never allowing it to reach a height of four inches, it can be completely eradicated. It is practicable to do this, for very little grass will appear in the cotton, and what does appear will be attached to loose roots easily pulled from the ground. While Johnson grass produces rootstocks in abundance, it spreads very slowly by this means, but spreads rapidly by seed. These are produced in great quantity, are readily eaten by stock, and are thus carried over all parts of a farm on which it has once gained a foothold. Johnson grass usually gives three cuttings of hay in a season, of about a ton each on good land. The hay is of excellent quality, particularly for cattle and for all horses except livery horses liable to be subjected to hard driving after a full feed. In such cases its laxative and diuretic effect becomes objectionable. As a pasture grass it can not be compared with Bermuda, though it is greatly relished by all kinds of stock. It is soon killed down completely when heavily pastured, but when the land is plowed it springs up again.

Brome Grass (*Bromus inermis*).— This is a recent introduction from east central Europe, and on the prairie soils of the Northwest and the Pacific Northwest, it occupies the place that bluegrass holds on the glacial drift of the more humid climate to the East. It is much larger than bluegrass, and hence furnishes more feed. It is much relished by all classes of stock. Stock eat with great avidity the straw from which seed is harvested, and the hay, cut just after the blossoms fall, is of excellent quality. Brome grass forms an excellent sod.

Italian Rye Grass (*Lolium italicum*).— This is perhaps the most important of all the meadow grasses in England and on the continent of Europe. It is relished by stock better perhaps than any other of the cultivated grasses; yet, for some reason not entirely clear, it is almost unknown in America. The only section of the country in which it has gained favor is in northwestern California, western Oregon, and western Washington. It is adapted to a very wide range of soils. It thrives remarkably on land reclaimed from salt marshes by dyking, and it is also a valuable grass on upland soils that are inclined to be dry. Practically speaking, it is an annual, but if properly managed it reseeds itself in such a manner as to be practically a perennial. It is a valuable constituent of all pasture mixtures, and is a hay grass of much value. It is not well adapted to single culture, being rather too weak of stem to stand alone.

English Rye Grass (*Lolium perenne*).— This differs from the last in no essential respect except that it does not grow quite so tall, and is slightly more inclined to a perennial habit. It is an important European grass practically unknown in America.

Tall Fescue and Meadow Fescue (*Festuca elatior,* and variety *pratensis*).— These two grasses differ in no essential particular (from the agriculturist's standpoint) except that the first is taller and more leafy than the second, and therefore more valuable as a forage plant. The smaller form is frequently known as English bluegrass, a name which has led to much confusion, and which should be abandoned. It is not closely related to our Kentucky bluegrass, nor to Canadian bluegrass (*Poa compressa*). Tall fescue is much confused with meadow fescue by seedsmen, and it not infrequently occurs that seed of the latter is sold under the name of tall fescue. This fact has hindered the

recognition of the decided merits of tall fescue. Next to Italian and English rye grass, these two grasses are the most important cultivated grasses in Europe. But like the rye grasses, they have never been recognized as valuable grasses in this country except in a few restricted localities.

Tall Oat Grass (*Arrhenatherum avenaceum*).— This grass is found occasionally in all parts of the country, but is nowhere an important crop. Stock do not eat it readily at first, but soon become accustomed to it, and then eat it freely. It has considerable value both for hay and for pasture.

Cheat, or Chess (*Bromus secalinus*).— In the central and eastern States, cheat is a pernicious weed in wheat fields, and it is popularly believed that, under certain unknown conditions, wheat turns into cheat, and it avails nothing that the fallacy of this notion has been demonstrated time and time again. In some parts of the South, and in the Willamette Valley in Oregon, cheat is sometimes grown for hay. It produces a large yield of rather poor hay. Being an annual, it is of little value for pasture.

Velvet Grass (*Holcus lanatus*).— This grass is common in the Pacific coast region along roadsides and in waste places. On sandy soils along the coast and on peaty soils that dry out in summer, velvet grass is perhaps the most profitable hay and pasture grass, because the better grasses do not succeed. Stock usually refuse to eat it until driven by hunger, but they will soon acquire a taste for it, and it is exceedingly nutritious. Its worst faults are its low yield and lack of palatability.

Canadian Bluegrass (*Poa compressa*).— A grass of small economic value, found quite generally over the northern States and in Canada. It is of some value as a sand binder, and, when kept closely mowed, it forms a smooth, even sod in lawns.

Crab Grass (*Panicum sanguinale*).— This is not, strictly speaking, a cultivated grass. It springs up in cornfields in late summer, and frequently furnishes a considerable crop of hay, which is of fair quality. It is universal in the South and extends northward to the Missouri and Ohio rivers.

Fodder Grasses.— Under this term we may include the coarse-growing grasses such as the sorghums, Kafir corn, Milo maize, teosinte, etc. On account of their large size, they require to be handled in a different manner from the common hay grasses. They are usually cut and shocked after the manner of fodder corn, though most of them may be handled by haying machinery if they are sown quite thick.

The sorghums (saccharine sorghums) were introduced into this country about the middle of the last century, and were extensively grown for syrup making before the now universal adulteration of this class of food materials destroyed the market for all farm-made syrups. At present little sorghum syrup is produced, but the sorghum plant is much grown for fodder. Its most valuable characteristic is its ability to withstand protracted drouth. It is therefore especially adapted to the western edge of the humid region, where it is exceedingly popular. Sorghum is also very generally grown in all the southern States, where the fodder is particularly valuable as a feed for the plantation mules. In all the cotton-growing States, as well as along the edge of the great plains, sorghum is a much more certain crop than corn (maize). Kansas is the leading State in the production of this crop. Some varieties are grown as far north as Minnesota and North Dakota. In the South two or three cuttings may be made in a season.

Several varieties of Kafir corn (non-saccharine sorghums) have become established in this country in recent years. The plant resembles a low-growing, branching, very leafy sorghum. It is cultivated either for fodder or for grain, of which latter it yields abundant crops. The grain is inferior to corn, but its more certain yield in dry seasons renders it a valuable crop in the same sections where sorghum is grown. It is rather more distinctly a southern crop than sorghum, being grown most largely in Kansas, Oklahoma, Texas, and New Mexico. Milo maize is not very widely known in this country, but it is gaining a foothold in parts of Texas, where it is grown after the manner of sorghum and is said to furnish large crops of valuable fodder or hay. Teosinte (*Euchlenea mexicana*) is a tropical plant somewhat resembling sorghum, but in reality more closely related to corn (maize). It does not produce seed in this country, but on rich alluvial soils in the southern States it produces enormous yields of green fodder much relished by cattle. It is of no account on poor thin soils. Near the cities, where dairying is an important industry, this crop is of great value in the South. It may be cut several times in a season, and there is no waste in feeding it, as the stalks are readily eaten.

Pearl millet may be classed with the sorghums on account of its manner of growth, but botanically it is quite different from them. It is a native of Africa, and was introduced in this country about 30 years ago. It has been tried very generally over the country, but has never gained favor. The seed is frequently unreliable, and the stems are inclined to be woody when approaching maturity.

A large number of our wild grasses have more or less economic importance. In fact, a majority of them furnish food for domesticated animals, while some are important for other reasons, as will appear in the discussion below. Only a few, however, are of sufficient importance to warrant their mention here. It is somewhat remarkable that none of our wild grasses have been domesticated during the past hundred years. This is perhaps due to the fact that the best of them were brought into cultivation very early in the history of the country. The more important genera of our wild grasses are:

Andropogon.— This genus is particularly well developed along the eastern edge of the western plains, where several species form important constituents of the immense acreage of wild hay cut in that region; also in the southern States, where it constitutes the major part of the growth of grasses in open woods and abandoned fields. *A. virginicus* is one of the most abundant grasses from Maryland southward. These grasses are large and coarse, and are not much relished by stock except in the early stage of their growth, whence the common practice of burning over the prairies to start a new growth of tender grass.

Agropyron.— This genus is particularly characteristic of the northern Rocky Mountain States, where several species are valuable for forage. They are, as a rule, better relished by stock than

the preceding, and some of them furnish hay of excellent quality. *A. occidentale* is the well-known blue-stem of the mountain regions and the western margin of the plains. It has strongly creeping rootstocks, and is perhaps the best hay grass among the wild species in the region where it grows. There is reason to believe that it will in time constitute an important crop on cultivated lands, particularly in the moister valleys of the northern portion of the arid region. *A. divergens* is the common bunch grass of eastern Washington and Oregon and northern Idaho. It is valuable on the ranges, and furnishes very good hay where the rainfall is 20 inches or more. *A. repens* is the well-known quack grass of our northern States. On account of its great development of rootstocks it is a very pernicious weed. Yet it furnishes fairly good forage, and is recommended by some for cultivation in the semi-arid region. It also has some value as a sand binder. *A. tenerum,* the slender wheat-grass of the northwestern prairies, is a good hay grass, seed of which may now be had on the markets.

Ammophila.— A genus of one species, known as beach grass; in Australia and South Africa called "marram." This is as yet the only species of grass that has been used successfully in northern latitudes as a sand-binding grass on dunes near the coast. For this purpose it is invaluable. Extensive plantations of it have been made on both the Atlantic and Pacific coasts; also on dunes near the Great Lakes. It is propagated by digging up bunches of the grass, separating each one into several small bunches, and then resetting them in the sand.

Arundinaria.— The cane of the southern cane-brakes, a relative of the Oriental bamboos. It is much utilized as winter forage for cattle, which frequently winter in good condition in the brakes. There are two closely related species, the larger one furnishing the common cane fishing rods.

Avena.— *A. fatua,* the wild oats of the spring-wheat producing States, is a weed in wheat fields. In several States the common hay is cut from patches in wheat fields taken by wild oats. If cut early enough the hay is of fair quality. Wild oats form an important constituent of the forage on the ranges of portions of the State of California.

Bouteloua.— This is one of the most characteristic genera of the arid regions of America, particularly in the Southwest. Side oats grama (*B. curtipendula*) is a handsome and valuable grass on the plains, where it furnishes much valuable feed. Blue grama (*B. oligostachya*) is the buffalo grass of the plains of eastern Montana, and is also a valuable forage plant.

Bulbilis.— Buffalo grass (*B. dactyloides*) is probably the most valuable wild grass of the plains region, extending from the Dakotas and Montana to southern Texas and New Mexico. It is one of the most nutritious grasses, rivaling Kentucky bluegrass in this respect, but is less productive than the latter. In Texas and elsewhere there were formerly vast areas of buffalo grass forming a compact sod; but owing to overstocking, and the depredations of prairie dogs, the grass is now much less in evidence. It is not well adapted to use on cultivated land because of its poor seed habits.

Calamagrostis.— An important genus along the northern border of the United States. Bluejoint (*C. canadensis*) is an important constituent of swamp hay, of which a large acreage is cut in Minnesota, Iowa, and adjacent States.

Cenchrus.— Two species of *Cenchrus* are found in sandy soils in the South and West. They are noted for the hard spiny "burs" in which the seed are found. They are known as "sand burs," and are pernicious weeds in sandy soils.

Setaria (*Chætochloa*).— The foxtail grasses. Two species, the yellow foxtail and green foxtail, are useless weeds which spring up in wheat fields after harvest.

Distichlis.— Salt grass (*D. spicata*) is common in salt water marshes on the coasts, and on alkali soils in the arid regions. It has some value as a forage plant.

Elymus.— This is a large and important genus. Several representatives are widely distributed, and some possess considerable value as forage plants. *E. condensatus* (giant rye grass) is a very characteristic grass in lowlands in the arid regions, where it grows in large clumps, attaining a height of 6 or 7 feet. While not greatly relished by stock, it frequently suffices to sustain life during periods when other grasses are covered by snow. It has been sown on cultivated land in some irrigated lands of the West, particularly where alkali has begun to appear, and it furnishes large crops of hay. This hay is rather too laxative for horses, but is said to make good feed for cattle. *E. triticoides* (wild wheat) is found in great abundance on wet meadows in eastern Oregon and adjacent regions, where it is frequently cut for hay. The forage is said to be excellent. *E. canadensis* is a very variable species, common throughout the central and northern States. Some forms of it are characterized by strongly developed rootstocks, and thrive in the sandiest soils. It probably has considerable value for holding embankments in places where the soil is sandy. It is also a good forage grass, and is worth more attention than it has yet received for this purpose in the semi-arid region.

Festuca.— One of the characteristic genera of the western States. *F. ovina* (sheep's fescue) is one of the most abundant and most valuable grasses of the ranges in the mountain regions.

Hordeum.— Squirrel-tail grass (*H. jubatum*) is common on the plains of the West, particularly in the north. When young and tender it is eaten by stock. When mature, its rough beards are often injurious to stock; they penetrate into wounds in the mucous membrane of the mouth and into crevices in broken teeth, and often cause the death of horses and cattle. *H. murinum,* a species found on the Pacific coast, has barbed beards which penetrate the skin of young animals. It is a most pernicious pest.

Muhlenbergia.— A genus particularly well developed in the South, where several species of it are usually found in moist or shady places. Nimble Will (*M. diffusa*) is one of the commonest species. A genus of no particular value.

Panicularia.— Four species of *Panicularia* are common swamp grasses of the northern States. They are all excellent forage grasses, but are little utilized, since they seldom grow in situations that permit them to be harvested.

Panicum.— One of the largest and most important genera of grasses in the United States, particularly prominent in the southern States.

Several species have already been noticed in the list of tame grasses above. These are crab grass, Colorado grass, Japanese millet, and the broom-corn millets. The most prominent remaining species are: *P. amarum,* a grass with long creeping stems, common on sands near the coast from Connecticut to Florida and along the Gulf coast. This species is of considerable value for holding drifting sands. *P. capillare,* Old Witch grass, tickle grass, an annual with widely branching panicles, common and sometimes troublesome as a weed in cultivated ground. *P. maximum,* Guinea grass, introduced into Florida from the tropics. A valuable fodder plant, furnishing several cuttings in a season, sometimes confused with Johnson grass, but much less hardy. *P. proliferum,* sprouting crab grass, growing in much the same region as crab grass, but extending farther northward. It springs up in cultivated fields in late summer, and is occasionally utilized as pasture or hay. *P. virgatum,* switch grass, ranging from Maine to the Gulf and westward to the Rocky Mountains. It is a perennial, 3 to 5 feet high, and, if cut very early, furnishes a large yield of fairly good hay. It deserves attention as a hay and pasture grass in semi-arid regions.

Paspalum.— Another large and important genus. Seeds usually in digitate spikes resembling those of crab grass. Carpet grass (*P. compressum*) is a valuable pasture grass near the Gulf coast, particularly on sandy soils. On such soils it will even drive out Bermuda when closely pastured. Its spreading stems form a dense carpet-like growth which gives it its popular name of "carpet grass." Water grass (*P. dilatatum*) is another common grass in all the southern States, frequently found in wet lands. Its seed has recently been placed on the market, and it is used to some extent as a hay and pasture grass. Knot grass (*P. distichum*), with creeping stems, is also common in the South, where it is frequently mistaken for Bermuda, which it closely resembles. Said to be valuable on wet lands as pasture.

Phalaris.— One of the species of this genus (*P. arundinacea*), known as "reed canary" grass, is one of the most thoroughly cosmopolitan species in this country. It is found all over the country, usually on wet or overflowed land, but frequently on uplands as well. It is a perennial with creeping rootstocks (underground stems) growing 4 to 6 feet high. Few grasses are better relished by stock, either as hay or as pasture; and, were it not for its habit of shedding its seeds the moment they are mature, it would undoubtedly have become an important cultivated grass long ago. *P. canariensis* is the well-known canary grass, seed of which is commonly used as food for canary birds.

Poa.— This is one of the most characteristic genera of this country, some representatives of it being well-nigh universal, except in the far South. Kentucky bluegrass, the June grass of the northern States, one of the most important grasses in America, has been fully discussed under the tame grasses above. Many varieties of this species are found in the wild state in the Northwest, where it is of great importance as a range grass. Even in the region of its greatest importance it is a semi-wild plant, springing up everywhere from seed scattered by the wind or by stock. It is the finest pasture grass in the world, but not the most productive. *P. annua* is another representative of the genus found all over the country. It is particularly common in the South and on the Pacific coast, where it remains green during the entire winter. This species is not native here, but is fast becoming one of our commonest grasses. It is frequently found in lawns, and in cultivated grounds. It seldom attains a height of more than a few inches. Texas bluegrass (*P. arachnifera*) is noted for the cottony appearance of its seed. It is also a valuable grass for winter pasture in the South, but is somewhat difficult to establish in a pasture. Like Bermuda, it is usually propagated by setting small pieces of the sod a foot or two apart each way. It is a native of Texas, but is nowhere very abundant. Many species of Poa are found in the far Northwest, where they are important range grasses. *P. laevigata* is frequently cut for hay on wet meadows in the mountain regions of Oregon and Washington.

Savastana.— Vanilla grass (*S. odorata*), commonly called "sweet grass" in the Northwest, is found from New England to Oregon and Washington. It is noted for its strong vanilla-like odor, resembling the odor of sweet vernal grass. The dried leaves are used by the Indians in weaving small mats and boxes, in which condition they retain their characteristic odor.

Spartina.— Cord grass (*S. cynosuroides*) is an important constituent of the swamp hay of which large quantities are cut in Minnesota, Wisconsin, and Iowa. It is frequently found in large areas growing alone, as if it had been sown there by hand. The hay is of fair quality, and the yield large.

Sporobolus.— Another characteristic genus of the West and Southwest, where several species are important on the ranges. Saccaton (*S. wrightii*) is common in Arizona and New Mexico, where it grows in large clumps, and is frequently cut for hay. Although decidedly coarse, the hay is valued as forage. Dropseed (*S. cryptandrus*), common on the western plains and in the Rocky Mountains, is much relished by stock.

Stenotaphrum.— A single species, *S. dimidiatum,* is of importance. It is frequently used as a lawn grass from Charleston, S. C., southward. Sometimes called Charleston lawn grass and Mission grass. This is the pimento grass of Jamaica. In New South Wales it is called buffalo grass. It grows on all kinds of soils, from heavy clay to almost pure sand, but is seldom found far from the seashore.

Stipa.— A large and important genus in our western flora. Several species are remarkably long-awned on the flowering glumes, giving them the popular designation of needle grasses. Some of them have the lower end of the seed produced into a hard, sharp joint which frequently penetrates the skin of animals, rendering these species somewhat of a nuisance to stockmen. Many of them, however, make excellent hay on the great plains. *S. leucotricha* is the bearded mesquite of central and southern Texas, a valuable wild hay grass. *S. vaseyi,* found in the Rocky Mountains at altitudes of 5,000 to 6,000 feet, has the peculiar property of inducing sleep in stock that eat it, for which reason it is known as "sleepy grass." No harm, further than a desire to sleep, seems to follow a feast on this grass; the effects wear off gradually in a day or two.

Uniola.— One species (*U. latifolia*) has large panicles of broad, drooping spikelets, rendering it exceedingly graceful. It is used as an ornamental, and is indeed one of the most beautiful of the grasses. It is found from Pennsylvania westward to Illinois and southward. *U. paniculata,* seaside oats, grows abundantly on the sands of our southern Atlantic coast, and on the Gulf coast, where it serves as a sand binder.

Zizania.— Wild rice; Tuscarora rice. Wild rice (*Z. aquatica*) is one of the most striking in appearance of any of the American grasses. It occurs on mud flats almost all over the country. It is very abundant on the tide flats of the Delaware and Potomac rivers, as well as in many other places both in the United States and Canada. A field of it in bloom presents a very pleasing appearance with its large, graceful panicles, yellow below with a great wealth of staminate flowers in drooping branches of the panicle, the upper, pistillate branches rising gracefully at various angles. When found in situations that permit it to be harvested, Indian rice is cut for forage, yielding enormous quantities of succulent feed much relished by stock. The seed is gathered in quantity for food by Indians in the northern States and in Canada. It is frequently planted in mud or shallow water for its seed, of which fish and birds are exceedingly fond. The seed is gathered in boats, into which it is threshed from the tall stems growing in water. The seed keeps best under water.

Ornamental Grasses.— A number of valuable ornamental grasses have been mentioned above. A few others deserve notice. Reed (*Arundo donax*) is found in door yards in nearly all parts of the country, particularly in the South, though it thrives quite well at the North. It frequently attains a height of 15 feet or more. It resembles sorghum, but is more leafy and more graceful in appearance. It is a perennial, springing up in early spring from the roots. As a background for smaller ornamental plants it is invaluable. Many of the bamboos are exceedingly useful as ornamental plants. Only a few species are adapted to northern latitudes. A garden variety of *Phalaris arundinacea* is common in this country under the name of ribbon grass. Its leaves are striped with white. There is also a similar striped variety of reed. *Coix lachryma-jobi,* Job's tears, is a small to medium-sized grass frequently found in gardens and door yards; it is noted for the indurated, tear-shaped covering of the seed. *Eulalia japonica* of the Orient, *Erianthus ravennæ* (Ravenna grass) of Italy, and *Gynerium argenteum* (Pampas grass) of the Argentine pampas are other well-known and deservedly popular ornamental grasses.

W. J. Spillman,
Agrostologist U. S. Department of Agriculture.

Grass'hopper-frog, or **Cricket-frog,** a small agile, noisy frog (*Acris gryllus*), common throughout the warmer half of the United States, whose spring cry is like the rattling produced by striking rapidly together two resonant pebbles. It is about an inch long, brown with a blackish triangular patch on the back of the head and a dorsal stripe. Its eggs are attached in little masses to a blade of marsh-grass.

Grasshoppers and Locust-plagues, insects of comparatively large size of the orthopterous families *Acridiidæ* and *Locustidæ,* or short-horned and long-horned grasshoppers respectively. In Great Britain and her colonies the former are the "locusts" of popular speech, and only the *Locustidæ* are called "grasshoppers." For the allied family of crickets, see Gryllidæ. The *Acridiidæ* have the antennæ shorter than the body and blunt, the ovipositor short and its parts divergent at the tip, and the sound-producing organs (see Orthoptera), on the hind thighs and outer edge of the forewings. In the *Locustidæ* the antennæ are long and tapering, the ovipositor long and sword-like, and the sound-organs are at the inner base of the forewings. This latter family embraces the katydids, tree-crickets, green meadow-grasshoppers, and certain western species erroniously called "crickets," and the group is more particularly treated under Katydid. In both families the hinder legs are greatly enlarged, enabling the insects to make the long leaps so characteristic of them; their wings are also capable of carrying them in some cases many hundreds of miles.

The short-horned grasshoppers are those of greatest interest economically, and those responsible for the "locust" plagues of Africa, Arabia, and southern Asia, as also in our West. From time to time vast bodies of certain species sweep from one region to another in swarms many square miles in area and so dense as to darken the sun, feeding on grasses and herbage, and consuming not only crops and pasturage as if by fire, but stripping bushes and trees of foliage and even of the bark. In the ancient world such visitations, which frequently extended into central Europe, caused extensive local famines, sometimes resulting in the loss of hundreds of thousands of human beings and vast numbers of grazing animals. Such "plagues" lasted for two or three years, the hosts breeding numerously at first, but gradually dying out and ceasing to reproduce outside the limits of their permanent breeding-grounds. The reproduction of grasshoppers consists in the deposit in autumn of eggs laid in bunches, covered with a secretion which hardens into a case or "pod," beneath the surface of the ground, into which the ovipositor is deeply thrust, and where the eggs remain to be hatched the following spring; in warm countries, however, two generations may take place annually. The locusts referred to in Scripture belonged probably to the species now named *Schistocerca peregrina,* of North Africa and Arabia. The swarms which from time to time appear in South Africa are of *Pachytylus migratoroides;* while *P. migratorius* is the best-known one of southern Europe and Asia. Similar species inhabit the open interior regions of both North and South America, a species of *Acridium* afflicting Argentina.

Of the many species in the United States those of the genus *Melanoplus* are of greatest interest because frequently destructive of crops. The most conspicuous is *M. spretus,* the Rocky Mountain locust, which has been a scourge of agriculture west of the Mississippi River ever since settlements began there. Among the more recent great plagues were those of 1856 and 1874, the latter enduring three years and causing widespread ruin throughout the whole region between the Mississippi River and the Rocky Mountains. The federal government appointed a commission of entomologists to investigate the habits of the insect, and its three 'Reports'

(1877, 1879, and 1882) are exhaustive essays on the subject. It was found that these and other destructive locusts bred throughout the whole plains region in the river bottoms and sunny depressions, and that little could be hoped for in defence except the gradual effect of cultivation in destroying the eggs and young by late and early plowing. This effect has been gained with unexpected celerity; and troublesome grasshoppers now breed in considerable numbers only in northern Idaho and central British Columbia. Swarms occasionally migrate and do damage, but the extensive plagues of the past will probably not recur. Nevertheless, grasshoppers are likely often to be locally harmful in the West, and must be combatted intelligently. The most valuable preventives are the burning over or deep plowing of breeding grounds, so as to turn the eggs out and kill them in the fall or before they can hatch in the spring. The grasshoppers themselves may be captured by means of "hopper-dozers" or kerosene pans. A cheap destroyer consisting of one part of Paris green thoroughly mixed in 60 parts of fresh horse-dung, two pounds of salt to half a barrel of the mixture being added, after being dissolved in water. This mixture is scattered broadcast along the edges of crops where infestation is feared, and the locusts, liking and eating the poison, die a few days later. The ordinary bran-arsenic mixture for cut-worms may also be used, and in some regions wheat fields are protected by a trap-crop of rye sown in a strip around the fields and poisoned by spraying with Paris green.

Consult: Sharp, 'Insects' (Vol. VI., Cambridge Natural History 1900); Howard, 'The Insect Book' (1901); and publications of the United States Department of Argiculture, especially Bulletin 25, Division of Entomology.

Grass'quits, a group of interesting little seed-eating finches of the West Indies, belonging mainly to the genus *Sporophila,* and flocking in grassy lands and pasturage.

Gra'tian, or **Gratianus Franciscus,** Benedictine writer of the 12th century. He was a native of Chiusi, and is considered the founder of the science of canon law. He was the author of a famous work, entitled 'Decretum; or, Concordia discordantium Canonum,' in which he endeavors to reconcile those canons that seem to contradict each other. It is a rich storehouse of the canon law of the Middle Ages. The best edition of the text is found in the 'Corpus Juris Canonici' of Richter (1833–9).

Gratian, or **Gratianus,** grā-shĭ-ā'nŭs, Roman emperor; eldest son of the Emperor Valentinian: b. Sirmium, Pannonia, 359 A.D.; d. Lyons 383. When only eight he was raised by his father to the rank of Augustus. On the death of Valentinian in 375 the eastern part of the empire still remained subject to Valens, and Gratian was obliged to share the western part with a half-brother, a child of four years, associated with him under the title of Valentinian II. In the early part of his reign the Goths and Alemanni made incursions into the Danubian provinces and into Gaul. They were repeatedly defeated by Gratian and his generals, but they also advanced into the eastern empire, and defeated and killed Valens in 378. Gratian then bestowed the eastern empire upon Theodosius, one of his generals.

Gratiola, grā-tī'ō-la, a genus of scrophulariaceous plants with many species widely distributed in temperate regions. A notable representative is the European hedge-hyssop (*Gratiola officinalis,* which is extremely bitter, acts violently as a purgative, diuretic, and emetic, and in overdoses is an acrid poison. It was formerly highly esteemed as a medicine, and its virtues were supposed to depend on a bitter resinous principle called "gratiolin."

Grattan, grăt'an, **Henry,** Irish orator and statesman: b. Dublin 3 July 1746; d. London 4 June 1820. He was called to the Irish bar in 1772, and in 1775 was elected member for Charlemont in the Parliament of Ireland. He immediately became distinguished in the opposition, and infused that spirit into the country which produced in 1782 a repeal of the statute of 6th George I., which had enacted that the crown of Ireland was inseparably connected with that of Great Britain; that Ireland was bound by British acts of Parliament when named therein; that the Irish House of Lords had no jurisdiction in matters of repeal; and that the last resort in all cases of law and equity was the British House of Lords. For his share in the acquirement of this concession the Irish Parliament voted him £50,000 and a house and lands for him and his heirs forever. He became the leader of the country party in the House of Commons, and the head of the Irish Whigs. Disgusted by the Irish rebellion and its manifold horrors, he temporarily seceded from Parliament, but the project of a union being brought forward by Pitt, he once more obtained a seat in Parliament for the purpose of opposing it. When it was carried, however, he did not refuse a seat in the United House of Commons, being returned in 1805 for Malton in Yorkshire, and in the following year for Dublin. His later years were chiefly occupied in a warm and energetic support of Catholic emancipation. Grattan was the zealous friend of Ireland from first to last. As a public speaker he had to contend with a defective voice; but his eloquence was bold and commanding, combining strength with beauty, and energy and elevation with elegance. The best collection of Grattan's parliamentary speeches is that edited in 1822 by his son Henry, who also wrote an account of his 'Life and Times' (1839–46). See Lecky, 'Leaders of Public Opinion in Ireland' (1871); Dunlop, 'Henry Grattan' (1889).

Gratz, Rebecca, American educator: b. Philadelphia 4 March 1782; d. Philadelphia 27 Aug. 1869. Of a family noted for wealth and culture, she showed her bent of mind by founding in 1838 in Philadelphia the Hebrew Sunday-school, the oldest society of its kind in America, and for 32 years she was at its head. Apart from her labors in behalf of the Jewish poor and needy, she was quick to respond to the claims of charity without regard for creed, and she was long regarded as Philadelphia's representative Jewess for her simple piety, personal charm, and social standing. Her name will always be associated with Scott's 'Ivanhoe,' for once when Washington Irving was visiting Sir Walter Scott and learned that a Jewess was to be introduced in the latter's novel, then in course of preparation, the American described Rebecca Gratz with so much warmth — she was a dear friend of his betrothed, Miss Hoffman, whose

early death produced such poignant grief—that Scott was deeply impressed. When 'Ivanhoe' was finished he sent the first copy to Irving, with the inquiry whether the «Rebecca» of romance compared favorably with the «Rebecca» of reality. Miss Gratz's portrait is preserved, after a painting by Thomas Sully, in John Sartain's 'Reminiscences of a very Old Man' (D. Appleton & Company 1900).

Grau, Maurice, American operatic manager: b. Brunn, Austria, 1849. He came to the United States with his parents in 1854; was graduated from the New York College in 1867, and from Columbia Law School. From 1872 until 1903 he was the most prominent operatic manager in America, securing a long line of singers, musicians, and actors, including names so diverse as Aimée, Rubinstein, Salvini, Sarah Bernhardt, Patti, Irving, Coquelin, Jane Hading, Mounet-Sully, Mme. Rejane. As director of the Maurice Grau Opera Company, he brought some of the most famous singers of the day to America.

Grau, Miguel, mē-gĕl' grow, Spanish-American admiral: b. Piura, Peru, 1834; d. 1879. After studying in the naval school at Callao he entered the Peruvian navy as a midshipman in 1852. In 1871 he was put in command of the turret ship Huascar and in the Chilean war of 1879 was killed by the explosion of a shell while engaged with two ironclads of the enemy.

Graubünden. See GRISONS.

Gravatt, William Loyall, American Protestant Episcopal bishop: b. Port Royal, Va., 15 Dec. 1858. He was educated at Virginia State College and Virginia Theological Seminary. Deacon's orders were conferred upon him in 1884 and he was advanced to the priesthood in 1885. In 1899 he was consecrated bishop of western Virginia.

Gravel. See CALCULUS.

Gravel-root. See EUPATORIUM.

Gravelotte, gräv'lŏt, **Battle of,** one of the most severely contested and most important conflicts of the Franco-German war (q.v.). It is named after a village of Lorraine, seven miles west of Metz, but is also called by the French the battle of ST. PRIVAT, and of GRAVELOTTE and REZONVILLE. After the disastrous defeats at Wörth and at Forbach on 6 Aug. 1870 the French in two armies, one under MacMahon and one under Bazaine, retreated along the line of the Moselle, their object being to join forces at Châlons. To prevent this the first German army under Prince Frederick Charles intercepted Bazaine by a circuitous march, forced upon him the battle of Courcelles and Mars-la-Tour, and compelled him to keep within touch of Metz. On 18 August the armies of Prince Frederick Charles and Steinmetz, numbering about 211,000 troops under the command of King William, attacked the position. Bazaine had taken position with about 111,000 men around Gravelotte to the west of Metz. By a flanking movement the Germans captured St. Privat and defeated the French attempt to break through at Gravelotte. After nine hours' desperate fighting, in which the Germans lost over 28,000 men and the French over 12,000, the latter were forced to retreat into Metz, which was immediately invested by Prince Frederick Charles, and capitulated two months later on 27 October.

Graves, Anson Rogers, American Protestant Episcopal bishop: b. Wells, Rutland County, Vt., 13 April 1842. After being graduated at Hobart College, he took a course at the General Theological Seminary 1870. When the missionary district of Platte (now designated the missionary district of Laramie) was constituted in 1889, he was consecrated first bishop 1 Jan. 1890.

Graves, Frederick Rogers, American Protestant Episcopal bishop: b. Auburn, N. Y., 1858. He was graduated at Hobart College (1878), and the General Theological Seminary (1881). His ministry has been devoted to work in China, he having been ordained for the foreign missionary field, deacon in 1881 and priest in 1882. His consecration as bishop of Shanghai took place in 1893. He has published several works in Chinese.

Graves, John Temple, American journalist and orator: b. Wellington Church, Abbeville District, S. C., 9 Nov. 1856. He was graduated at the University of Georgia in 1875. He is generally classed with Henry Grady as an orator and leader of patriotic sentiment in the South. He has been on the staff of the Atlanta *Journal* since 1892, and is an advocate by pen as well as by voice of a separation between the white and colored races in the United States.

Gravitation. The law of gravitation is the law discovered by Newton, according to which every portion of matter attracts every other portion with a force directly proportional to the product of the two masses, and inversely proportional to the square of the distance between them. The motion of the planets round the sun in ellipses, each marking out the area of its orbit at a constant rate, and each having a year proportional to the square root of the cube of its mean distance from the sun, implies that there is such a force on each planet exactly proportioned to its mass, directed toward, and inversely as the square of its distance from the sun. The lines of force radiate out from the sun on all sides equally, and always grasp any matter with a force proportional to its mass, whatever planet that matter belongs to. Since the force is always proportional to the mass acted on, and produces the same change of velocity whatever that mass may be, the change of velocity tells us nothing about the mass in which it takes place, but only about the mass which is pulling. If, however, we compare the accelerations due to different pulling bodies, as for instance that of the sun pulling the earth with that of the earth pulling the moon, or if we compare changes in motion due to the different planets pulling each other, then we can compare their masses and weigh them one against another and each against the sun.

All this was clearly seen by Newton, and was set forth in his 'System of the World' (3d ed., p. 41). Kepler (q.v.) had indeed given the laws, deduced from observation, according to which the planets describe their orbits. From these Newton deduced the laws of the force in the case of the planets; and subsequently he generalized the statement of them, by showing the identity of the nature of the force that retains the moon

in her orbit, and that which attracts matter near to the surface of the earth. Kepler's laws state, first, that every planet revolves round the sun in an ellipse, of which the sun occupies one focus; second, that the velocity of any planet at different parts of its orbit is such that the radius vector from the sun to the planet sweeps over equal areas in equal times; and third, that the distances of the various planets are so related to the periods of their revolution that the squares of the periodic times are proportional to the cubes of the mean distances from the sun. From these laws Newton made the following deductions: He inferred from the second law that the planet is acted on by a central force that is always directed toward the sun. From Kepler's first law he deduced the law of variation of the force for any one planet, and found that the force varies inversely as the square of the distance of the planet from the sun. Lastly, he concluded from Kepler's third law a relation between the forces on the various planets; namely, that the forces on equal masses of the different planets are inversely proportional to the squares of the distances of those planets from the sun. This law indicates the identity of the nature of the force that acts on the different planets. Newton next proceeded to consider the motions of the moon; and to ask the question, "Is not the force that causes the moon to fall toward the earth the same as that which influences falling bodies near to the earth's surface?" This question he attempted to put to the test of calculation. At first he was unsuccessful. The then received estimate of the dimensions of the earth were so far from correct that the comparison between the force of attraction in a stone and that in the moon at her distance from the earth did not exactly agree with his theory, and he was obliged to give it up for nearly 20 years. It was not till 1684, when he heard a paper of Picard read at the Royal Society of London, on new geodetical measurements of the earth, that he obtained accurate data to work with; and, returning home, he set to work to examine the question afresh.

Newton saw that a mountain mass might be used, and weighed against the earth by finding how much it deflected the plumb-line at its base. The density of the mountain could be found from specimens of the rocks composing it, and the distance of its parts from the plumb-line by a survey. The deflection of the vertical would then give the mass of the earth. Not long after Newton's death the mountain experiment was actually tried. The honor of making the first experiments on gravitation belongs to Pierre Bouguer (q.v.), whose splendid work does not appear to have received the credit due it.

Having established the law of gravitation throughout the solar system, it was natural to infer the universality of its action. We know on the one hand, by observing the motion of the planets and satellites, the asteroids, and the comets, that the law holds with great exactness for all these bodies; on the other hand, experiments of Cavendish with balls of lead, and of others, verify its exactness down to very short measurable distances: and though we are unable with our present appliances to determine the orbits of double stars and of other stellar systems, still we seem to be fully justified in assuming that in these cases also the law stated above holds, at least, very approximately.

The track was first laid down by Newton, based on astronomical observations, and only made firmer and broader by every later observation. Important work in Europe has recently been done in gravitational experiments by the late Prof. U. Jolly, and by Profs. Braun, Boys, and Poynting, who, with others, have advanced beyond the results of Henry Cavendish (q.v.), whose device, known as the Cavendish experiment, for determining the density of the earth, has so long interested scientists. The latest research has verified Newton's celebrated guess that "the quantity of the whole matter of the earth may be five or six times greater than if it consisted all of water."

No inquiry on gravitation has showed that it is related to anything but the masses of the attracting and the attracted bodies. It appears to have no relation to physical or chemical condition of the acting masses or to the intervening medium. This independence of gravitation of any quality but mass, bars the way to any explanation of its nature or source.

There is a point respecting the law which is almost universally passed over without notice, although it is one of the most important questions with respect to the construction of any theory to account for gravitation; namely, the exact proportionality of the gravitating forces of any two bodies to their masses. The most delicate experiments show no deviation from the exactness of this law; nor has the most accurate observation of planetary bodies sufficed to detect any such deviation. This is the fact proved by the well-known guinea-and-feather experiment, in which it is shown that though a mass of gold and a feather do not fall equally fast under ordinary circumstances, because of the unequal resistance of the air in the two cases, yet that, the air being removed by means of the air-pump, they fall with equal velocity. The experiment proves that the force of gravity in the two cases is exactly proportional to the mass of the guinea and of the feather. Newton showed the same thing himself with far greater minuteness by vibrating balls of various materials similarly suspended. In this, which is known as Newton's pendulum experiment, it is shown that pendulums of equal length vibrate in equal times whatever be the material and the masses of which the bobs of the pendulum are made. By this experiment, when performed with all the nicety at command, it is probable that any deviation amounting to a ten-thousandth or a hundred-thousandth part of the whole amount considered could be detected. Planetary motions prove the law to even a greater degree of accuracy. It is curious that this portion of the law, though it is only proved by experiment and observation, is hardly ever, if ever, referred to by popular writers. It is either assumed without pretense of proof, or is passed over without remark.

Notwithstanding the vast interest and importance of the study which this subject presents, and all the labors of eminent scientists in endeavors to solve its complex problems, it still remains to be said that the world is yet without any theory which can really be considered as explaining gravitation. Consult **Mackenzie**, 'The Laws of Gravitation' (1900).

Revised by Simon Newcomb.

Gravity, in physics, the terrestrial gravitation, the operation of the law of gravitation on the earth, specially in making heavy bodies fall in all parts of the planet in the direction of its centre. Newton (q.v.) and Bessel have shown that in a vacuum a sovereign and a feather will fall with equal speed, though the rate will be different in the atmospheric air. The attraction of the whole earth, considered as a sphere, on a body at its surface, is the same as if the whole matter of the earth were collected at its centre. The attraction of the earth on a body within its surface is the same as if the spherical shell situated between the body and the earth's surface was removed; or is the same as if all the matter situated nearer to the earth's surface than the body was collected at the centre, and all the matter situated at a greater distance was removed. The weight of a body is proportioned to the attraction which it exerts, hence gravity in many cases means simply weight (q.v.).

Gravity, Specific. See SPECIFIC GRAVITY.

Gray, Asa, American botanist: b. Paris, Oneida County, N. Y., 18 Nov. 1810; d. Cambridge, Mass., 30 Jan. 1888. He was graduated at the Fairfield Medical College in 1831; but had already acquired a taste for natural science which led him to abandon the practice of medicine for the study of botany. The flora of the United States was by no means well known and classified at that period, and many botanical problems were to be solved by the attainment of new data in his chosen science. He had attracted notice so early as 1834 and was appointed botanist to the Wilkes Exploring Expedition, which was so dilatory in starting that he resigned the position in 1837, and in 1842 was elected Fisher professor of natural history at Harvard University. Between the resignation of his post as botanist to the Wilkes Expedition and his acceptance of the chair at Harvard, he took the opportunity of traveling over Europe, where he made many social and scientific friends and in England met Dean Church of St. Paul's, London, then Fellow of Oriel College, Oxford, with whom he kept up a correspondence of the most intimate friendship until his death. Both were many-sided men of keen intellect and reverent minds. From 1842 to 1873, when he retired from his professorate at Cambridge, the life of Gray is to be read in his published works. He gradually developed the reputation of a botanist of the first rank, one of the greatest of his century, and certainly the greatest his country had ever produced. His lot was cast at a point in the history of science when the artificial system of botany was to pass away, and the new and natural method was to undergo development. There were vast masses of new material constantly pouring in from the newly explored middle western Territories, together with the rich spoils that government expeditions were bringing by sea from the Pacific coast. Prof. Gray, with the assistance of Dr. John Torrey (see TORREY, JOHN), set about to arrange these multitudinous specimens in accordance with the newest methods; to identify, name and classify them. His work was to be called the 'Flora of North America,' and was to be a comprehensive history of the botany of the country upon a classification basis of natural affinity. This work was not completed beyond the order of *Compositæ,* as the constant accessions of new specimens rendered the portions already published out of date, and proved that the attempt at so colossal an undertaking would be premature before all the material was in, and every specimen had been deliberately examined and classified. Yet Gray's pen could not be idle, and he published volume after volume in which he showed he was as clear and concise as an exponent of botany in its elementary principles, as he was skilful and bold in wide generalizations and profound analysis. His scientific position was that of a theistic evolutionist. He dissented from Darwin's opinion that variation was the result of fortuitous contingencies. He was a teleologist and believed that species were differentiated according to a preordained plan in the mind of a creator, and he was of the spirit that could subscribe to evolution and yet repeat the Catholic creed. His principal writings are as follows: 'Elements of Botany' (1836); 'Structural and Systematical Botany' (1879); 'Manual of Botany for the Northern United States' (1848); 'Genera Boreali-Americana Illustrata' (1849); 'Botany of the United States Exploring Expedition under Captain Wilkes' (1854); 'Plantæ Wrightianæ Texano-Neomexicanæ' (1853); 'Darwiniana, Essays and Reviews Pertaining to Darwinism' (1876); 'Synoptical Flora of North America' (1884); 'Natural Science and Religion' (1880); published posthumously, 'Scientific Papers of Asa Gray' (1889); and 'Letters of Asa Gray' (1894).

Gray, Barry. See COFFIN, ROBERT BARRY.

Gray, David, American journalist: b. Buffalo, N. Y., 8 Aug. 1870. He was graduated from Harvard in 1892, entered journalism in 1893 as a reporter and editorial writer for the Rochester *Union and Advertiser,* became managing editor of the Buffalo *Courier* in 1897, and after a course in law was admitted to the bar in 1899. He has published 'Gallops,' a collection of fox-hunting sketches reprinted from the 'Century.'

Gray, Elisha, American inventor: b. Barnesville, Ohio, 2 Aug. 1835; d. Newtonville, Mass., 21 Jan. 1901. During his attendance at Oberlin College his skill in handicraft enabled him to support himself by carpentry. He left college to apply himself to the improvement of electrical apparatus; and in 1867 received his first patent for a self-adjusting telegraph relay. He subsequently invented the telegraphic switch and annunciator for hotels, the telegraphic repeater, the private telegraph line printer, etc. The litigation between him and Alexander Graham Bell, both of whom claimed to be inventors of the telephone, resulted in a verdict in favor of the latter, whose rights were sustained by the Supreme Court. The telautograph, by which written messages were to be sent over the telephone or telegraph, was patented by him in 1893. For many years he was engaged practically in the manufacture of electrical apparatus in Chicago and Cleveland and founded the Gray Electric Company in Highland Park, Ill. The Congress of Electricians at the World's Columbian Exposition was organized by him in 1893, and he was elected to preside at its sittings. Among his writings the most notable are: 'Experimental Researches in Electro-Harmonic Telegraphy and Telephony' (1878); and 'Elementary Talks on Science.'

Gray, Henry Peters, American painter: b. New York 23 June 1819; d. there 12 Nov. 1877. He was a pupil of Daniel Huntington in 1838, and after several years abroad he established himself in New York, and was president of the National Academy 1869–71. Among the most important of his works are: 'Wages of War,' now in the Metropolitan Museum; 'The Judgment of Paris'; 'Cupid Begging his Arrows'; 'Apple of Discord'; 'Blessed are the Pure in Heart,' an illustration of Irving's 'Pride of the Village'; 'Hagar and the Angel.'

Gray, Horace, American jurist: b. Boston 24 March 1828; d. Nahant, Mass., 15 Sept. 1902. He was graduated from Harvard in 1845, from the Harvard Law School in 1849; studied law also in the office of Judge Lowell; was admitted to the bar in 1851, and in 1854–61 was reporter of the Massachusetts supreme court. At the same time he became a leader of the Massachusetts bar, in 1864 was appointed an associate justice of the State supreme court, and in 1873–81 was chief justice. While on the Massachusetts bench he rendered numerous important decisions in connection with the exemption of the United States from suit, ancient boundaries and grants, the law of charities, the effect of war upon private rights, and other matters, and gained an extensive reputation for the force and clearness of his style. In 1881 he was appointed to the Supreme Court of the United States, and this post he held until his resignation in 1902. His views upheld a broad construction of the Constitution and of Federal power, as for example, in his opinions regarding the insular cases which resulted from the acquisition of new domain by the United States government. Other opinions concerned the civil law of Louisiana, the conflict of laws, United States jurisdiction over the Guano Islands, and the exemption of Federal property from State taxation. It is stated that his dissenting opinions were comparatively few.

Gray, John Chipman, American legal authority, Royall professor of law at Harvard from 1883. He also practises law in Boston, and among his published works may be mentioned: 'Restraints on the Alienation of Property'; 'Select Cases'; 'Rule Against Perpetuities'; 'Cases on Property.'

Gray, John Purdue, American alienist: b. Half Moon, Pa., 1825; d. Utica, N. Y., 29 Nov. 1886. He was graduated from Dickinson College in 1846 and took a medical degree at the University of Pennsylvania in 1848. He was successively assistant physician and medical superintendent of the New York State Asylum at Utica. He introduced many improvements into the treatment of the insane, and was for many years editor of the 'American Journal of Insanity.'

Gray, Joshua, American inventor: b. Sheffield, Vt., 4 May 1824; d. Medford, Mass., 25 June 1899. He received a common school education; became connected with the Manchester (N. H.) Locomotive Works, and while there designed a system of quick-steaming boiler tubes. His other inventions include the rubber-tipped lead pencil, a breech-loading magazine rifle, a seven-armature dynamo, a railroad signal, and a sewing-machine shuttle.

Gray, Maxwell. See TUTTIET.

Gray, Robert, American discoverer: b. Tiverton, R. I., May 1755; d. Charleston, S. C., 1806. In 1787 he was appointed to the command of the sloop Washington, equipped by Boston merchants for trade with the Indians of the Pacific coast. He returned in the Columbia in 1790, and, proceeding by way of Canton, was the first to carry the United States flag around the earth. During a second voyage he discovered the Columbia River, which he named from his ship. He was subsequently in command of trading vessels.

Gray, William Crane, American Protestant Episcopal bishop: b. Lambertville, N. J., 6 Sept. 1835. He was graduated at Kenyon College (1859); ordained deacon in 1859 and priest in 1860. He was consecrated bishop of southern Florida in 1892.

Gray, Thomas, English poet: b. London 26 Dec. 1716; d. Cambridge 30 July 1771. He was educated at Eton, where he was intimate with Horace Walpole, and St. Peter's College, Cambridge. He quitted college in 1738, traveled on the continent and returned to England in 1741. His father soon after died, and leaving but a small property, Gray returned to academic retirement at Cambridge. Here he continued for several years, occupying himself with forming magnificent literary schemes, which he admirably commenced but wanted energy to mature. So slow was he to publish, that it was not until 1747 that his 'Ode on a Distant Prospect of Eton College' made its appearance; and it was only in consequence of the printing of a surreptitious copy that, in February 1751 he published his 'Elegy Written in a Country Churchyard,' which went through four editions in two months. In 1757, on the death of Cibber, the office of laureate was offered to Gray, who declined it, and next year he published his two Pindaric odes, 'On the Progress of Poesy,' and 'The Bard.' These odes have never been popular, but many critics of high reputation have expressed the warmest admiration for them. In 1768 the Duke of Grafton presented him with the professorship of modern history at Cambridge; in consequence of which he wrote the 'Ode for Music,' for the installation of that nobleman as chancellor of the university the following year. He was buried with his mother in the churchyard of Stoke Poges, in Buckinghamshire. As a poet, Gray is lofty, energetic, and harmonious. As a writer of Latin verse he is surpassed by few, and his letters published by his friend Mason in 1775, are admirable specimens of his epistolary style. In his private character he was of a friendly and affectionate though somewhat fastidious disposition, which gave an air of effeminacy and timidity to his manners, subjecting him to much ridicule. His general acquirements were uncommon, but his want of energy and perseverance rendered his extensive research little effective. In 1884 a complete edition in four volumes of Gray's works, both prose and verse, with nearly 350 letters, was published by E. W. Gosse. See Gosse, 'Life of Gray' (1882); Ward, 'English Poets' (Vol. 3).

Gray Duck, the gadwall (q.v.).

Gray Whale (of California). See RORQUAL.

Grayback, the name, in popular speech, of several animals strikingly gray in color, as the

gray whale (see RORQUAL); the knot (q.v.) and certain other shorebirds; or a body-louse. See LOUSE.

Graybeard Moss. See USNEA.

Graydon, James Weir, American inventor: b. 18 Jan. 1848. He was graduated at the United States Naval Academy; served during the Civil War period in the Federal army under Sherman and Grant; was later promoted lieutenant in the navy, and resigned. His inventions include a dynamite gun; the Graydon gigantic wheels; an aërial torpedo; a cable system of torpedoes, and a railway carriage heater, all bearing his name.

Grayhen. Feminine of BLACKCOCK (q.v.).

Graylag Goose. See GEESE.

Grayling, A fish of the family *Thymallidæ*, much resembling a slender salmon, 15 to 18 inches long, and formerly included in the salmon family. Some five species of the single genus *Thymallus* are known, all inhabitants of northern regions, in rapid streams where the water is clear and cool, and the bottom sandy or pebbly. Its habits are similar to those of trout, except that it spawns in the spring. Its flesh is excellent, with an odor and flavor, when fresh, of wild thyme. It is caught by fly-fishing as for trout, and is a favorite with anglers. Two species are known in North America, each with so limited and scattered a distribution that they are regarded as modified relics of a preglacial circumpolar species. The Arctic grayling, or «poisson bleu» (*T. signifer*) of the fur-hunters, inhabits only the Mackenzie basin and rivers in Alaska. The more southerly and familiar grayling (*T. tricolor*) is restricted to certain streams in northern Michigan, where it is almost extinct, and seems incapable of recovery by fishcultural methods; and to Montana. These fish are distinguished from trout or salmon by the large size of the dorsal fin and by their grayish hue, with half-a-dozen deep blue spots on the fore part of the abdomen. Consult: Pritt's 'Book of the Grayling' (London 1888); and Jordan & Evermann's 'American Food and Game Fishes' (New York 1902).

Gray's Inn, one of the four Inns of Court, in London, situated on the north side of Holborn and to the west of Gray's Inn Lane. It contains a hall of the period of 1560. It derives its name from the noble family of Gray of Wilton, whose residence it originally was.

Gray's Peak, a peak in the Colorado range, in Colorado, and one of the highest in the Rocky Mountains. Its height is 14,341 feet. It was named in honor of Asa Gray, the botanist.

Gray'weather, or **Graywether,** a sandstone of the Tertiary strata scattered over the surface of the ground in Dorsetshire and Wiltshire, England. It was from these stones that the famous druidical circles were built.

Grease-bug, or **Overflow-bug,** a groundbeetle (*Platynus maculicollis*), common in California, and occasionally a pest in houses because of its disagreeable odor when crushed, and because it nibbles bread and meats.

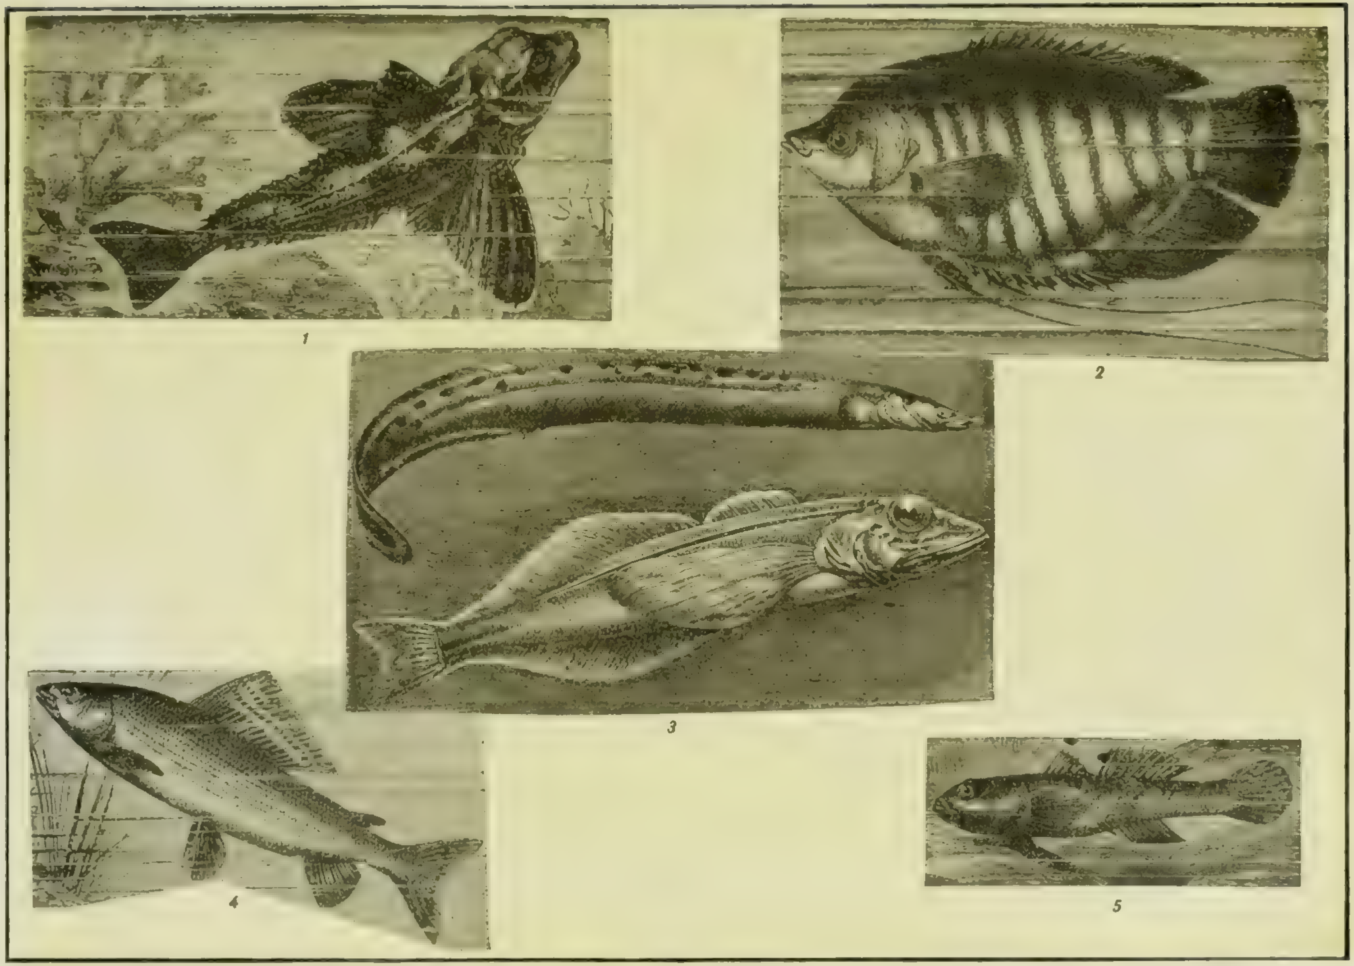
Greasewood, a small, very thorny, almost leafless shrub (*Sarcobatus vermiculatus*) of the goosefoot family (q.v.), which abounds among the sage-brush on the arid plains of the western United States, especially where the soil is saline. The wood, which is yellow and very hard and tough, frequently supplies the only fuel available there, and burns with a bright hot crackling blaze suggesting grease.

Great Auk. See GAREFOWL.

Great Awakening, the popular name of a great and tenacious «revival» in New England, 1740–5, under the influence of Jonathan Edwards and George Whitefield. Edwards had created a similar excitement in Northampton five years before, the embers of which were still glowing, but on Whitefield's visiting him in the fall of 1740, and preaching his thrilling sermons in addition to Edwards', the wave spread all through New England, involving over 150 towns, and rising almost to frenzy. It was marked by the extremest accompaniments of bodily seizures, convulsions, hysteria, etc., and aimed especially to bring young children under its control. Edwards was rightly considered its author, and was fiercely denounced for its irrationality and evil effects on public worship, as well as the temporary ruin of calm and fruitful work; he defended it for some time, but its results at last came to be deplored even by its champions, and by 1742 it was threatening not only the peace but the life of the churches. So bad were its effects that to the reaction has been attributed the religious deadness of the country for the next 60 or 70 years. The separation of the «converted» into an arrogant clique who often seceded in separate churches, the upspringing of a horde of ignorant lay preachers making physical effects the touchstone of religion, the indecent rivalry in «manifestations,» the denunciation of all the trained ministry as lacking divine grace, were only a part of its demoralizing outcomes. The faculties of Yale and Harvard colleges pronounced against it, as did the leading divines; the Massachusetts General Convention of 1743 added its testimony, and in Connecticut an effort was made to enforce the Saybrook Platform against the independence of congregations.

Great Barrington, Mass., town in Berkshire County, on the New York, N. H. & H. R.R.; 40 miles west of Holyoke. In the town are three villages: Great Barrington, Housatonic and Van Deusen. It was settled in 1725, but formed a part of Sheffield until 1761. William Cullen Bryant was town clerk for several years, and the thoughts in many of his poems were suggested by the beautiful Berkshire scenery. The town has a good public library, the Hopkins Memorial Manse, the Sedgwick Institute, and a number of good elementary schools. The manufactures are cotton goods, electrical apparatus, and paper. Pop. 5,872. Consult: Taylor, 'History of Great Barrington.'

Great Basin, a vast region of interior drainage, a triangular plateau of North America, occupying the western part of Utah, and nearly the whole of Nevada, parts of Oregon and California, and extending at its northeast angle into Idaho. It is bounded on the west by the Sierra Nevada and on the east by the Wasatch Mountains. The base of the triangle at the north is 500 miles from east to west, and the extent from north to south is 800 miles. The area is about 210,000 square miles, a little larger than France. It is traversed by numerous mountain ranges, irregular in arrangement; the



1. Gurnard (Trigla hirundo). 2. Gourami (Osphromenus olfax).
3. Indian Spring Eel (Mastacembelus armatus), above; and Golomynka or Oilfish of Lake Baikal (Comephorus baikalensis), below.
4. Grayling (Thymallus thymallus). 5. European Goby (Gobius fluviatilis).

valleys are mostly sinks, the chief drainage centre being Great Salt Lake (q.v.). The areas of greatest depression are to be found near the borders, and the greatest elevation near the central part. The highest range is the East Humboldt, one peak of which, Mount Bonpland, is 11,321 feet in height. Volcanic masses form or conceal the original rocks of many of these ranges. The slopes and the geological markings show that the lakes and rivers which once existed within this region have become smaller and some have disappeared. The greater portion of this section was once in the basin of the Columbia River. The Great Basin contains many streams and lakes (the latter for the most part salt) whose waters never reach the ocean, but are either taken up by evaporation or their waters sink in the desert sands. The mean annual rainfall ranges in different localities from 4 to 15 inches. The plateau is nearly destitute of trees, and in general only the upper parts of the valleys are clothed with desert shrubs, their lower portions often being covered with muddy water or with several inches of alkaline salts left by evaporation. The chief arid places are the Great Salt Lake Desert, the Mohave Desert, and the Carson Desert. This Basin is rich in mineral wealth; gold, silver, iron ore, and copper exist here in large quantities.

The Great Basin is among the large interior drainage sections of the world; but the interior drainage basin of Asia is 23 times as great, and the Sahara 16 times as great.

Great Bear Lake. See BEAR LAKE, GREAT.

Great Bend, Kan., city, county-seat of Barton County; on the Arkansas River, the Missouri P. and the A., T. & S. T. R.R.'s; about 92 miles northwest of Wichita. The Central Normal College is located here. It is a trade centre for the surrounding agricultural region, and contains flour mills and iron works. Pop. 2,500.

Great Bridge, Va., Battle at, 9 Dec. 1775. Lord Dunmore, royal governor of Virginia, hearing that a patriot force from North Carolina was on the way to occupy Norfolk, the largest town in Virginia and its chief port, built a rough fort at Great Bridge, over the Elizabeth River, commanding the southern approach. The Virginia patriots raised a band of sharpshooters, including John Marshall, afterward Chief Justice of the United States Supreme Court, took possession of the opposite bank, and in a 15-minute fight, which cost Dunmore 61 regulars and the militia none, forced him to abandon the fort. A few days later the Virginians occupied Norfolk, which the spiteful governor set on fire before taking refuge in a war-ship in the harbor. The town was reduced to ashes.

Great Britain, Britain, or **Britannia,** was the name applied by Cæsar and other Roman writers to the island of Great Britain, Aristotle having referred to the *Nesoi Bretannikai* (British Isles) as early as the 4th century B.C. According to Rhys, Britannia has nothing to do with the Welsh *brîth,* "spotted, tattooed," from which it is commonly derived; the only Celtic words of the same origin are the Welsh vocables *brethyn,* "cloth," and its congeners; in which case the Britons may have styled themselves "cloth-clad," in contradistinction to the skin-wearing neolithic nation that preceded them. Britannia was a poetical or rhetorical expression till in 1604 James I. styled himself king of Great Britain; the term was proposed so early as 1559 by the Scottish Lords of the Congregation.

History.— The history of Great Britain is practically the history of England, with the added historical facts concerning Scotland and Ireland. Under the articles ENGLAND, SCOTLAND, and IRELAND will be found the histories of these respective countries. While specifically comprising England, Wales, and Scotland, and with Ireland forming the United Kingdom of Great Britain and Ireland, the designation Great Britain is commonly employed to indicate the United Kingdom and its colonial possessions. The history of the expansion and growth of Great Britain and the development of her colonies will be found in the various articles on AUSTRALIA, CANADA, INDIA, and of other parts of the British Empire.

Constitution.— The British constitution is in nearly every important respect unique. It is a conspicuous instance of gradual evolution, resulting in the end in the creation of a system of law and government superior in comprehensiveness, in stability, in elasticity, to any of the numerous constitutions drawn up on what were supposed to be the most enlightened and logical principles. One of the best examples of the characteristically English development of important institutions entirely outside of written law or formal legislative enactment is the position occupied by such a body as the cabinet, a body never officially recognized by any act of Parliament, and wholly unknown to the written law, yet practically the highest executive body in the kingdom, though nominally the executive government is vested in the sovereign. The English constitution does not exist written in any single document, nor even in a few or in many documents; much of it, indeed its most vital and important part, is based on custom hardened into inviolable precedent, and is in a sense unwritten. The principal sources of British constitutional law have been arranged under four heads, namely: (1) Treaties or quasi-treaties; (2) the precedents and customs known as common law; (3) compacts; and (4) statutes. The last is at the present day practically the only method by which the British constitution may receive additions and modifications, and to its scope there are no theoretical limitations. The treaties of constitutional importance are the Act of Union with Scotland, passed in 1707, and the Act of Union with Ireland, passed in 1800, each consisting really of two statutes, and these created the United Kingdom and the Imperial Parliament. The second source, customary law, though unwritten in a sense, is now embodied in a mass of judgments, opinions of eminent lawyers, and other similar documents. It includes — and this is most characteristic of English institutions — many of the most important matters of public polity, such as the organization and inter-relations of the Crown, cabinet, lords, and commons. The compacts refer to the powers of the Crown considered as distinct from and opposed to the nation, and include the Great Charter of 1215, the Bill of Rights of 1689, and the Act of Settlement of 1700, which have been called "the title-deeds of English political liberty." They have something of the character of ordinary statutes, but differ

in the peculiar part played by the king in respect to their provisions. The great extension of the franchise brought about by recent statutes and the introduction of voting by ballot have had the effect of giving the constitution far more of a democratic character than formerly, with what result in further legislation remains to be seen. The existence of a body of hereditary legislators is objected to by many, but the question of "ending or mending" the House of Lords can hardly as yet be said to have become an important one.

The Sovereign.— Under the title of a constitutional and hereditary monarchy the government of Great Britain is vested in the sovereign and the two houses of Parliament — the House of Lords and the House of Commons. The fundamental maxim upon which the right of succession to the throne depends is that the crown is, by common law and constitutional custom, hereditary, and that the right of inheritance may from time to time be changed or limited by Parliament; under which limitations the crown still continues hereditary. It descends to the males in preference to the females, strictly adhering to the rule of primogeniture. The sovereign is of age at 18 years. The heir to the crown has, since the time of Edward III., inherited the title of Duke of Cornwall, and receives that of Prince of Wales by letters patent. The power of the sovereign is limited by the laws. The divine right, so obstinately maintained by the Stuarts, was never recognized by the nation, and William III., Mary, and Anne ascended the throne, according to express declarations, only by virtue of a transmission of the crown to them by the nation. One of the most important attempts to override the law by the authority of the crown was the abuse by James II. of the dispensing power, an infringement of the ancient liberties of the realm which was one of the chief causes of the revolution of 1688. The maxim has, however, been acknowledged, particularly since the Restoration, that there is no power in the state superio the royal prerogatives; the acts of the king are therefore subject to no examination, and the king is not personally responsible to any tribunal; hence the maxim, "The king can do no wrong." Yet there is sufficient provision for confining the exercise of the royal power within the legal limits. (1) All royal acts are construed in accordance with the laws, and it is taken for granted that the king can never intend anything contrary to law. (2) The counselors of the king are responsible for the royal acts, and, as well as all those who are concerned in the execution of them, are liable to impeachment and examination, without the right of defending themselves by pleading the royal commands. (3) The Parliament and the judicial tribunals have also the right to discuss freely such royal acts, and, in particular, Parliament and each individual member of the upper house, has the right to make remonstrances to the Crown. (4) Individuals are protected from any abuses of the royal power by the Habeas Corpus Act of 1679, the liability of the agents to prosecution, the right of complaining to Parliament, recourse to the courts of justice, and the liberty of the press.

The king is the supreme head of the state in peace and war, the lord paramount of the soil, the fountain of justice and honor, and the supreme head of the Church. The supreme headship of the Church as belonging to the sovereign dates only from the ecclesiastical changes of Henry VIII.'s reign. The king also has the prerogative of rejecting bills in Parliament, which, however, has not been exercised for some 200 years. As the generalissimo, or the first in military command within the kingdom, he has the sole power of raising and regulating fleets and armies, which, however, is virtually controlled by the necessity he is under of obtaining supplies from Parliament. As the fountain of justice, and general conservator of the peace of the kingdom, he alone has the right of erecting courts of judicature, and all jurisdictions of courts are derived from the crown. As the fountain of honor, of office, and of privilege, he has the power of conferring dignities, privileges, offices, etc. In the foreign relations of the nation he is considered the nation's representative, and makes treaties, declares war, etc. As advisers he has the privy council and the cabinet. In the cabinet are included all the greater officers of state, such as the first lord of the treasury, the secretaries of state for foreign affairs, for the home department, for the colonies, and for India, and others, and thus the cabinet is in reality at the head of the administration. Consequently it forms a link between the legislative and executive departments of the state, as above pointed out. See Edward VII.; Victoria.

Parliament.— The origin of the upper house of the British Parliament has been sought rightly enough in the Witenagemôt (literally "meeting of the wise men") or national assembly of the Anglo-Saxons, which under some of the kings had much the character of a royal council. In a somewhat different form, due to its adaptation to feudal territorial conceptions, the Witenagemôt was continued in the Norman times. Gradually, however, the Great Council, as the Witan was called under the Norman kings, began to divide into sections, owing to the great increase in its business which took place after the Conquest. Its judicial functions were step by step separated from its legislative and executive and its financial work, and from this separation, begun under Henry I., greatly advanced under Henry II., and completed in its main features under Edward I., arose several of the leading elements in the British national constitution. The exchequer represents the Great Council as the supreme financial body, the courts of king's bench, common pleas, etc., continue its judicial functions, the privy council retains in part its administrative character, while the House of Lords, though retaining a small portion of the judicial authority of its progenitor, mainly performs another function virtually inherent in the Great Council, that of legislation. For the origin of the lower house, or House of Commons, we must look to the old shire courts, which originally dealt only with local affairs, but latterly sent elected representatives to a central body to act for them in national affairs, and especially to provide the necessary taxes. When the boroughs increased in importance and numbers they were similarly represented; and in De Montfort's Parliament of 1265 there appeared representatives not only of the greater barons, including the greater ecclesiastics, but also of the shires and of the boroughs. In the Parliament summoned by Edward I., 30 years later, the same mode of representation was car-

ried out in a more thorough manner. The shire and borough representatives, though at first distinct, gradually coalesced, and thus the Parliament came to be regarded as including three estates, now known as the lords spiritual, the lords temporal, and the commons.

In the reign of Edward III. (1327–77) the separation of the estates into two houses — the House of Lords, consisting of the lords spiritual and the lords temporal, and the House of Commons, consisting of the knights, citizens, and burgesses — became settled, though the time at which the Commons began to sit as a separate assembly is not definitely known. The upper house is thus an older institution than the lower. All the peers were not originally entitled to a seat as a matter of right, but only those who were expressly summoned by the king. Every peerage of the United Kingdom conferred now, however, gives the right of a seat in the House of Lords or upper house. The number is indefinite, and may be increased at the pleasure of the Crown, which, however, cannot deprive a peer of the dignity once bestowed. The upper house at present comprises about 580 members. By the act of union with Scotland, 16 representatives of the Scottish peerage are elected by the Scottish nobility for the duration of each Parliament, and 28 are elected for life by the peers of Ireland. No parliamentary measure can become a law till it has passed the House of Lords as well as the House of Commons. In the upper house the lord-chancellor presides, holding the position of the speaker in the Commons, with this difference, that he has the right to take part in debate as an ordinary member of the House. All grants of subsidies or parliamentary aids must originate with the House of Commons, and the Lords have not the right to amend, but only to accept or reject, a money bill.

The Parliament is not permanent, and it is the royal prerogative to summon and dissolve it. As the Parliament is summoned, so it is prorogued, by the royal authority. A dissolution of Parliament is effected either by the authority of the Crown or by length of time. The House of Commons being chosen but for seven years, at the expiration of that time Parliament is dissolved *ipso facto*. The lower house of Parliament has the direction of all financial concerns; and there is perhaps no subject which may not be brought before it by petition, complaint, or motion of a member. The upper house is the supreme court of judicature in the nation. In civil cases (as now represented by the lords of appeal in ordinary) it is the supreme court of appeal from the superior tribunals of the three kingdoms. In indictments for treason or felony, or misprision thereof, where the accused is a peer of the realm, the House of Lords are the judges of the law and the fact. In cases of impeachment by the House of Commons the House of Lords are also the judges. All the forms of a criminal trial are then observed, and the verdict must be by a majority of at least 12 votes. The House of Commons is in no sense a court of law, and, powerful as it is, it cannot revise, amend, or in any way interfere with a judgment duly given in a court of law.

Parliamentary Reform.— The House of Commons in the first Parliament of Henry VIII. consisted of 298 members, a number largely increased by royal charters and by the Acts of Union, which gave 45 members to Scotland and 100 to Ireland. Just previous to the Reform Bill of 1832, therefore, it consisted of 658 members, of whom 513 were from England and Wales, 45 for Scotland, and 100 for Ireland. In this representation there were great injustices and anomalies. Many of the boroughs had quite fallen into decay, so that a place like the famous Old Sarum, which consisted only of the ruins of an old castle, sent two members to Parliament, while great manufacturing towns like Manchester and Birmingham were absolutely without representation. Not only the rotten boroughs, as these decayed constituencies were called, but also in many cases the towns, in which the right of suffrage belonged to a small number of freeholders, were practically in the hands of a single family, and in this way a few great houses — Norfolk, Bedford, Devonshire, and the Pelhams, etc.— commanded more than 100 seats in Parliament. For the few places that were in the hands of independent voters a shameless system of bribery existed, in spite of the prohibitory laws, and the prices of votes were generally well known: a seat for a small place cost about $25,000. This state of matters led to long-continued agitation for parliamentary reform, and ultimately, on 1 March 1831, Earl Grey being then premier, Lord John Russell introduced a plan of reform proposed by the government. On the 22d the English bill passed its second reading in the Commons by a majority of one, but the government suffered defeat in committee on a proposal not to reduce the number of members for England and Wales. A dissolution followed, but the Whigs again came into power under the same prime minister, and on 24 June Lord John Russell brought his second Reform Bill before the newly elected House. This bill, in which the proposed diminution of the number of English members was abandoned, finally passed the Commons on 21 September by 349 to 236, but was rejected by the Lords by 199 to 158. On 6 December, when Parliament met after the prorogation, a third Reform Bill was introduced by Lord John Russell, and passed the Commons on 23 March 1832. In the upper house the government was defeated on an amendment proposed by Lord Lyndhurst, whereupon Earl Grey asked the king either to create sufficient new peers to carry the bill, or to accept his resignation. The latter alternative was adopted, and the Duke of Wellington undertook the impossible task of forming an anti-reform ministry. On 18 May the Whigs were reinstated with the assurance of being provided with the means of passing the bill, and finally it passed the Lords by 106 to 22, owing to the absence of many of the opposition, who did not want to force the creation of new reform peers. The royal assent was given on 7 June. The Reform Bill of 1832 brought great changes. Occupiers of lands or tenements in counties at yearly rent of not less than $250, and occupiers as owner or tenant of a house or shop in a borough of a yearly value of $50, now received the franchise. Fifty-six rotten boroughs were wholly disfranchised; 30 boroughs were deprived of 1 member; and 1 borough (Melcombe-Regis cum Weymouth, which had 4) of 2 members; 22 boroughs were created in England to return 2 members each, and 20 boroughs to return 1 member each. Besides taking away the right of election from many insignificant places, and vesting it in large, or at

least in tolerably populous constituencies in new boroughs, the act introduced something like uniformity in the qualifications of the voters of the old boroughs and cities, and extended the elective franchise from close corporations, or privileged bodies to the citizens at large.

The Reform Bill had not been long in force when a further extension of the franchise began to be demanded. After several unsuccessful attempts by Lord John Russell, Lord Palmerston, and Mr. Gladstone to pass reform bills, in 1867 Mr. Disraeli, then chancellor of the exchequer, succeeded in carrying through a bill which conferred the borough franchise on all householders who had resided in the borough for 12 months previous to the last day of July in any year, and had been assessed for and paid poor rates, and on all lodgers who had occupied for a like period lodgings of the yearly value of $50 unfurnished. In counties the franchise was bestowed on occupiers as owners or tenants of subjects of $60 ratable value, and the copyhold and leasehold franchise was reduced from $50 to $25. This bill related only to England and Wales, but bills of a similar character were passed for Scotland and Ireland in the following year. In this way the electorate, which was 1,352,970 in 1867, rose to 2,243,259 in 1870, but the total number of members still remained at 658. To Manchester, Liverpool, Birmingham, and Leeds were assigned 3 members each, and to London University 1. Populous counties were further divided, and to many of the divisions 2 members each were given. This act, though in some ways it did not effect so great a change as that of 1832, is of even greater importance, since it may be regarded as marking the beginning of the present democratic system of representation.

From the union of Scotland with England in 1707 till 1832 the former returned 45 members to the House of Commons, 30 for the 33 counties, and 15 for 15 districts or burghs. Superiors, or persons holding directly from the Crown, alone voted in the counties. In two counties there were only three real voters in each. The number of persons who actually voted at the elections of the burghs was very inconsiderable, consisting, in general, of the magistrates and town council, amounting only to 20 in each burgh, or in all the 66 burghs to 1,320. By the Scotch Reform Act of 1832, 9 members were added to the representation; Edinburgh and Glasgow receiving 2 each, and Aberdeen, Dundee, Greenock, Perth, and Paisley 1 each. The right of voting was also placed as near as possible on the same footing as in England; but the number of members, though increased, was not in proportion with those allotted to England, or even to Ireland. By the Scotch Reform Act of 1868 the burgh franchise was assimilated to that of England, being conferred on householders, but in counties the occupation tenure was $70 or upward. Seven additional seats were given: 1 to the universities of Aberdeen and Glasgow jointly, 1 to those of Edinburgh and St. Andrews (the university electors being the members of the general councils), 1 to Glasgow city (which now had 3), 1 to Dundee (which now had 2), and 1 each to the counties of Lanark, Ayr, and Aberdeen, which were divided into 2 divisions, each returning a member.

Since the legislative union with Great Britain in 1801 Ireland had sent 100 members to the House of Commons, 64 for the 32 counties, 2 each for Dublin and Cork, 1 each for 31 other cities and boroughs, and 1 for Dublin University. By the Reform Act of 1832, 5 members were added, namely, 1 each to the towns of Belfast, Galway, Limerick, and Waterford, and 1 to the university; and $50 copyholders, etc., were admitted among the classes of county voters. In 1850 occupiers of land rated at $60 a year were admitted to vote. In the borough franchise the $50 qualification for owner or occupant was adopted in the reform of 1832, much the same as in England; and by the act of 1850 the franchise was further extended to $40 occupiers. By the Reform Bill of 1868 the occupation franchise in towns was reduced from $40 to $20, and for lodgers it was fixed at the same as in England and Scotland.

The Representation of the People Act of 6 Dec. 1884, established a uniform householder and a uniform lodger franchise throughout the kingdom, and increased the electorate by about 2,500,000 voters. Equally important changes were effected by the Redistribution Act passed in June 1885. By it 79 small boroughs in England and Wales (including four districts of boroughs in the latter) and 24 in Ireland ceased to return members separately, while in Scotland the Haddington and Wigtown districts of burghs lost the burgh franchise. In England 36 small boroughs, and in Ireland 3, lost 1 member each. The members for Liverpool were increased to 9, for Birmingham, the Tower Hamlets, and Glasgow to 7 each, for Manchester to 6, for Leeds and Sheffield to 5 each, and other important centres in proportion. Thirty-three new boroughs chiefly in the London metropolitan district, were created. Many of the larger boroughs were divided and a member given to each division; large counties were dealt with in a similar way. The numerical strength of the Commons was also raised, the gross number of members being 670, of which England gets 465 (2 additional), Wales 30 (as before), Scotland 72 (12 additional), and Ireland 103 (2 less). The following is a summary of the distribution of members according to the act of 1885:

ENGLAND.	
4 counties with 2 members each, 5 with 3 each, 9 with 4 each, 5 with 5 each, 4 with 6 each, 5 with 7 each, 5 with 8 each, Lancashire with 23, Yorkshire with 26, Rutland and Isle of Wight with 1 each	234
8 cities and boroughs with 1 each, 28 with 2 each, 9 with 3 each, and 5 with 4 each	187
Leeds and Sheffield 5 each, Manchester 6, Birmingham and Tower Hamlets 7 each, and Liverpool 9	39
Universities	5
	465
WALES.	
8 counties 1 each, 3 with 2 each, Glamorgan 5	19
7 districts of boroughs 1 each, Swansea and Merthyr Tydvil 2 each	11
	30
SCOTLAND.	
23 counties with 1 each, 5 with 2 each, Lanarkshire 6	39
16 burghs with 1 each, 2 with 2 eacn, Edinburgh 4, Glasgow 7	31
Universities	2
	72
IRELAND.	
21 counties with 2 each, 8 with 4, 1 with 7, 1 with 1, 1 with 3	85
6 boroughs with 1 each, 2 with 4 each, 1 with 2	16
Universities	2
	103
Total	670

Ranks and Titles.—The laws acknowledge only two distinctions of rank or civil status, the nobility and the commonalty. The distinction is by no means like that between the patricians and plebeians in ancient Rome, nor that between the nobles and citizens of France in the 18th century, and the peculiar privileges of the nobility are few and insignificant. Intermarriages with commoners are usual, and the sons of peers mingle with commoners in the House of Commons, where wealth, talent, and industry are at least as well represented as birth. Moreover, the House of Lords is continually recruited from the general body of commoners by the conferring of peerages on distinguished men. The peers are exempted from the performance of certain unimportant public services, such as sitting on juries, etc. They have also a right to be tried by the House of Lords on indictments for treason, or felony, or misprision thereof; but the administration of justice before this tribunal is as strict as in the ordinary courts. Their persons cannot be arrested in civil cases. The titles borne by those who form the peerage are, in a descending scale, duke, marquis, earl, viscount, baron. Of these, earl is the oldest, this title dating from the Anglo-Saxon period when it was equivalent to that of *ealdorman* or governor of a shire. After the Conquest the title of baron came into use. The barons formed an inferior class of nobles to the earls, though the term was also used to include all tenants-in-chief. The title of duke arose under Edward III., who created his eldest son Duke of Cornwall (1337). The title of marquis was introduced in the time of Richard II.; that of viscount during the reign of Henry VI. It is only the actual holders of these titles who are, strictly speaking, the nobility; their families are only noble by courtesy. The chief privilege that the titles confer is a seat in the House of Peers or — since the term lord is often used as equivalent to peer — the House of Lords. The Scottish and Irish peers sit in the House only by deputation; but many Scottish and Irish peers have also titles belonging to the peerage of Great Britain or the United Kingdom in virtue of which they sit; thus, the Marquis of Lothian sits as Baron Ker. The titles of nobility just mentioned are inherited by the eldest son, who, during the life of the father, as a rule bears by courtesy his next highest title if he is a duke, marquis, or earl; if the father be a viscount or baron, the son is only an "honorable." Any of the sons of a duke or marquis is called lord, but only the eldest son of an earl is so called. Next below the rank of the nobility are the baronets. This dignity was created by James I. in 1611, and descends to the eldest son. There are no privileges annexed to the baronetcy, but the title is considered an honor, and is often bestowed on men who have distinguished themselves in a civil or military capacity. Below the baronets are knights (who also have Sir before their names) and esquires, and all others that may be classed among the gentry. The knights are either members of one of the orders of knighthood, or they are knights bachelors. The term gentry is sufficiently vague, but may be said to include the richer landed proprietors, and all to whom wealth, office, or talents have secured a certain respect and standing in society. All these may be said to have a claim to be considered as of the rank of esquires, which, however, by law is somewhat restricted in its application.

Army and Navy.—The British army is raised on the authority of the sovereign, who is looked upon as its head, and from whom all officers derive their commissions; but the number of troops maintained and the cost of the different branches are regulated annually by a vote of the House of Commons. The maintenance of a standing army in time of peace without the consent of Parliament is prohibited by the Bill of Rights of 1689. From that time onward to 1879 an act called the Mutiny Act was annually passed for regulating the management of the army and enabling the sovereign to frame the Articles of War to serve as the military code. An Army Annual Act is now passed for the same purpose, and the regulations accompanying it contain the military law of the country. Till recently the whole of the military departments of the army were under the commander-in-chief as supreme head, the civil department being under the financial secretary; at present the secretary of state for war exercises control over all departments of the military service of the country, and the heads of departments, whether military or civil, are responsible to him. No British citizen is obliged to bear arms except for the defense of his country, but all able-bodied men from 18 to 30 years of age (with the exception of certain classes) are liable to service in the local militia, the militia being raised when required by ballot. Enlistment among the regulars is either for 12 years' army service (long service) or for 7 years' army service and 5 years' reserve service (short service). The regular army of Great Britain consisted in 1903 of a total of about 219,700 men of all ranks besides about 74,000 serving in India. There were in addition the four classes of reserve or auxiliary forces, namely, the militia, the army reserves proper, the volunteers and the yeomanry cavalry. The grand total of all branches at home and abroad amounted to fully 808,752 men. The volunteer force has been in existence only since about 1859. The British army is small when compared with that of some of the Continental states, but the reverse is the case with the navy, which is to be regarded as the main defense of the empire and its extensive commerce.

Alfred the Great is commonly regarded as the founder of the British navy, but as a permanent establishment its origin is rather to be attributed to Henry VIII. Under him were established the admiralty office and the dockyards of Deptford, Woolwich, and Portsmouth, the personnel of the navy at this time numbering about 8,000 men. Under Elizabeth the strength of the navy was greatly increased, and it continued to advance till at the revolution of 1688 the navy was manned by over 40,000 men. About the middle of the following century there were some 70,000 seamen and marines serving in the navy. The end of the 18th and the early part of the 19th century formed a glorious period in English naval history. In 1814 the navy consisted of some 900 vessels, manned by 146,000 men. After the peace the naval forces were greatly reduced in strength and the number of men employed has never been so great since. The introduction of steam as a propelling power, and of iron and steel as materials of construction, worked an immense change

in the character of the navy. In 1903, including officers, seamen, boys, and marines, there were about 122,500 of all ranks in the British naval service. This includes 4,200 men in the coast guard, or life-saving service. Formerly the navy was under the administration of a lord high admiral, but since the accession of William III. such an official has rarely been appointed, and a board of admiralty has taken his place. This board now consists of six members, at their head being the "first lord," who is always a member of the cabinet, and is responsible for the general direction and supervision of all naval business. Under him are four naval lords (men holding a distinguished position in the service) and a civil lord.

The effective vessels in commission in the British navy, February 1903, were as follows: 21 first-class battleships; 8 second-class battleships; 6 armored cruisers; 60 protected cruisers; and 57 destroyers. The navy has many other vessels launched, under way, or projected, as the following table will show:

Class	Compl'te for sea 1903	Launch'd and Compl't'g	Build'g or Project'd
Battleships, all classes....	45	4	5
Cruisers, all classes......	141	6	12
Gunboats	33	...	4
Destroyers	113	...	19
Torpedo Boats...........	51	...	4
Submarines	5	1	4
Totals	388	11	48

Finances.—The practice of borrowing money in order to defray a part of war expenditure began in the reign of William III. At first it was customary to borrow on the security of some tax, or portion of a tax, set apart as a fund for discharging the principal and the interest of the sum borrowed. This discharge was, however, very rarely effected. The public exigencies still continuing, either the loans were continued, or the taxes were again mortgaged for fresh ones. At length the practice of borrowing for a fixed period, or, as it is termed, upon terminable annuities, was almost entirely abandoned, and most loans were made upon interminable annuities, or until such time as it might be convenient for the government to pay off the principal. Owing partly, perhaps, to the scarcity of disposable capital at the time, but far more to the supposed insecurity of the revolutionary establishment, the interest paid by the government on these loans was comparatively high, and it was, moreover, subject to considerable variation. As the country became richer and the confidence of the public in the stability of the government was increased, ministers were able to take measures for reducing the interest. In the reign of George II. it was determined that the practice of varying the interest should be stopped. Instead of varying the interest on the loan, the rate was generally fixed at 3 or 3½ per cent, the necessary variation being made in the principal funded.

At the time of the death of William III., the public debt, partly by reason of the long wars, amounted to £16,394,702, the public income being £3,895,205. By far the greater part of the next reign also was a time of war, and on the death of Queen Anne the national debt amounted to £54,145,363. The reign of George I. was undisturbed by war, which enabled the government of the time to reduce the debt by £2,053,125, so that at the accession of George II. the whole amount of the debt was £52,092,238. The first 12 years of the reign of the new king were passed in profound peace, but during the latter years of his reign the country was engaged in extensive wars. The total expense of the wars that were carried on between 1739 and 1748 was estimated at £46,418,680, and the cost of the Seven Years' war was £111,271,996. At the conclusion of the Peace of Paris in 1763, after the Seven Years' war, the total debt amounted to £138,865,430. Between the Peace of Paris in 1763 and the outbreak of the American war in 1775 the national debt was again reduced, the amount of the reduction being £10,281,795. Thus, at the outbreak of the American Revolution the national debt was £128,583,635. To this that war added £121,267,993, but above £10,000,000 was canceled between the close and the commencement of the French war, when the debt stood at £239,350,148. During the French war £601,500,343 of new debt was contracted, and on 1 Feb. 1817, when the English and Irish exchequers were consolidated, the total debt was £840,850,491. A considerable reduction was effected between that year and the outbreak of the Crimean war, which again added nearly £33,000,000 to the total, so that in 1857 it amounted to £837,144,597. Since then the debt has been greatly reduced. In 1875 a special act was passed providing for the reduction of the debt, and on 31 March 1901 the whole amount of it was £690,992,622, carrying an annual interest charge of £19,835,489. On 31 March 1902, however, owing to the Transvaal War, the figures were £747,911,107, and annual interest £26,650,000. This includes both a funded and an unfunded debt. The latter species is that for which no formal provision has been made, or for which the provision has proved insufficient, or has not been forthcoming at the time when it was required. The form in which it mostly exists is that of exchequer bills, which bear interest at so much per cent per day, and pass from hand to hand like bank-notes. After a certain time they are received in payment of taxes or other moneys due the government, and the interest due on them is allowed in the payment. These bills were first issued in 1696. There are none now issued under £100, and many are for £500, £1,000, and larger sums. They are frequently converted into funded debt by granting capital in some of the stocks to the holders. In 1902 the total debt was divided as follows: Funded, £609,587,248, terminable annuities, estimated capital value at 3 per cent, £63,190,859; unfunded, £75,133,000; total, as above, £747,911,107; other capital liabilities, £20,532,279; grand total, £768,443,386. Against this might be put certain assets, more especially the shares acquired by Great Britain in the Suez Canal, the market value of which was £27,935,000. The national debt amounts to about £18, 6*s.*, 4*d.* per head of the population, and the annual charge on account of it is about 12*s.*, 8½*d.* per head. See National Debt.

Economic Supremacy.— Sir Robert Giffen estimates the total capital of Great Britain and her colonies at the enormous sum of $110,000,000,000, with an annual income of $16,000,000,000. He divides the capital between the home country and the colonies as follows:

United Kingdom	$75,000,000,000,000
Canada	6,750,000,000,000
Australasia	5,500,000,000,000
India	15,000,000,000,000
South Africa	3,000,000,000,000
Remainder of Empire	6,000,000,000,000

"No such economic force has ever been in the possession of a single state or empire. . . . France and Germany have each probably not more than a third or a half of these figures. . . . They have the beginnings of over-sea empire, but as yet, in comparison with the United Kingdom, beginnings only. . . . The United States alone of all modern states is comparable to the British Empire." Its aggregate income, he places at $15,000,000,000, derived from a capital of $90,000,000,000, and, he adds, "It would not be going too far to say that the two Anglo-Saxon states or empires more than outweigh in economic force the whole of the rest of the world."

Area and Population.— The area and population of the islands forming Great Britain, or as they are better known, the British Isles, are shown in the following table:

Divisions	Area in sq. miles	Population in 1901
England and Wales	58,309	32,526,075
Scotland	29,785	4,472,103
Ireland	32,583	4,458,775
Isle of Man	227	54,758
Channel Islands	75	95,841
Total	120,979	41,607,552

The area and population of the colonies of Great Britain are enumerated under the article British Empire (q.v.).

With regard to occupations and pursuits the census gave the following returns for England and Wales, Scotland, and Ireland: Professional class, 812,242 males, 439,452 females—total, 1,251,694; domestic class, 188,365 males, 2,170-260 females—total 2,358,625; commercial class, 1,616,065 males, 47,795 females—total 1,663,860; agricultural and fishing class, 2,349,652 males, 173,176 females — total 2,522,828; industrial class, 6,641,637 males, 2,383,521 females — total 9,025,158; others, 3,245,676 males, 10,716,413 females — total 13,962,089.

Religion.— In England and Wales the Anglican or Protestant Episcopal Church dominates with 2,004,493 communicants, the number of communicants of all other Protestant dissenting sects being estimated at 1,946,959; the adherents of the Roman Catholic Church are estimated at 1,500,000. In Scotland, the Presbyterian Church is the established form of worship, and in 1901 had 668,335 communicants; the United Free Church, a dissenting Presbyterian body, had 500,000 members; while the Roman Catholics were estimated at 365,000, and Episcopalians, 121,800. In Ireland the Roman Catholic Church is dominant, in 1901 its adherents being returned at 3,308,661, 74.2 per cent of the total population. The number of Jews is about 150,000, of whom nearly three fourths are in London.

Education.—Since 1870 education has made great advances in all the divisions of the United Kingdom. In that year a comprehensive measure (with compulsory clauses) for the promotion of elementary education in England was passed by the state. Its chief provisions were for the election of school boards in districts in which there was a deficiency of school accommodation, with power to build and maintain schools out of rates levied for the purpose, and for the giving of aid by parliamentary grant to these board schools as well as to previously existing schools. As the result of this act the whole country was mapped out into school districts, school boards were established in London and in all the school districts where there was a deficiency of school accommodation, and these school boards were permitted to make a compulsory by-law for their districts. These provisions were supplemented in 1876 by an act which provided that each school district which had no school board should at least have a school attendance committee. In 1900 there were in England and Wales 2,545 school boards, embracing in their operations a population of 20,142,943, and 788 school attendance committees, embracing a population of 8,859,532. The proceedings of these bodies and the manner in which they administer the acts are reported by H. M. inspectors to the education office. The Scotch Education Act, passed in 1872, was from the first a comprehensive measure which required the election of school boards in every burgh and parish, and made school attendance compulsory throughout the country, the school age being from 5 to 14 years. The child, however, can leave school when he has passed the 5th standard and is 12 years of age. It was provided by legislation in 1889 that the elementary education of Scotland should be almost entirely free; and in 1891 enactments were passed to make it entirely free, both in England and in Scotland. In 1897 an act was passed providing for money grants to necessitous voluntary schools. In Ireland, which is still far behind England and Scotland, elementary education is under the superintendence of a body of Commissioners of National Education, created in 1845, with powers to erect and maintain such schools as they thought necessary. There is, however, no compulsory school attendance in any part of Ireland. The Education Acts in England and Wales are administered under the general superintendence of the board of education, established in 1900, Scotland being under a special department. Of the schools in England and Wales in 1900, 5,758 with 2,201,049 pupils in average attendance were directly under school boards, while 11,777 with 1,885,802 pupils were connected with the National Society. The grants to elementary schools were in 1901: England, £8,390,907; Scotland, £1,196,236; Ireland, £1,321,905. Besides these grants the schools have an income from endowments, school fees, local rates, etc. There are a number of training colleges for teachers, organized mostly in connection with the different religious bodies.

Secondary education is divided into five classes, namely, private enterprise, subscribers, companies, endowed, and those under local authority. The total number of schools in 1901 was 6,209. The number of pupils was 291,544. The private enterprise schools numbered 5,167; the endowed, 619. Of the latter class many are known as grammar schools. A special class may be said to consist of the great public schools of Eton, Harrow, Rugby, Winchester, etc. In Scotland there are many higher class schools, and also secondary departments in other schools

under the school boards. Technical education received a great impetus from the passing of various acts from 1889 onward.

For the higher education there are in England the Universities of Oxford, Cambridge, London, Durham, the Victoria University, the University of Wales, and the Birmingham University. In addition to these there are colleges, some of them called university colleges, at Nottingham, Bristol, and other places (some of them for women), and the colleges belonging to the different religious bodies. Till 1900 London University granted degrees, but did not teach; it is now, however, a teaching university, having in connection with and forming schools of it, University College, King's College, and other institutions. In Scotland there are the four universities of Edinburgh, Glasgow, Aberdeen, and St. Andrews; a university college at Dundee incorporated with St. Andrews University; St. Mungo's College, and Anderson's College Medical School, Glasgow. Ireland has the University of Dublin, the Queen's Colleges at Belfast, Cork, and Galway in connection with the Royal University of Ireland (which is merely an examining and degree-conferring body), the Roman Catholic University in connection with Maynooth and other Roman Catholic colleges. A medical education may be obtained at the various universities and colleges, or in connection with the chief hospitals. See CAMBRIDGE; OXFORD, etc.

Climate.— The British Isles being nearly in the centre of the temperate zone, have, in common with all countries so situated, four different seasons, which merge almost insensibly into each other, but exhibit a wide range of temperature between their opposite extremes. The central latitude of the United Kingdom is nearly 55° N., and the isothermal line which passes through it indicates a mean annual temperature of 50°. The chief agents in moderating the climate of the British Isles are the Atlantic Ocean with its warm surface waters drifting from the southwest, and the warm winds which prevail during a large part of the year from the same quarter. While they blow, frost is of rare occurrence, and never of long duration in the British Isles. When the wind blows from the north, after it has passed over immense fields of ice, or from the east, where, from the limited expanse of the German Ocean, its temperature continues nearly as low as that which it had acquired in passing over the Continent, the atmosphere is rapidly cooled down, and frosts are occasionally severe. These considerations explain the only disadvantages under which the British climate labors.

Zoology.—The animals found in Great Britain are for the most part the same as those inhabiting similar latitudes over the whole of the North Temperate or Palæarctic region of the Old World. In fact Wallace says that the majority of genera in countries so far removed as Great Britain and northern Japan are identical. As the British Islands were formerly connected with the Continent, the general similarity is intelligible enough, while the geological changes of insulation and the restriction of area are enough to account for the one great difference that the British, and especially the Irish species, are much fewer than those on the mainland. Insulation, however, also abets the modification of species, and thus we find a few forms peculiar to Great Britain, such as the red grouse (*Lagopus scoticus*), a shrew (*Sorex rusticus*), as well as some land-shells and insects. But if we exclude these few exceptions, and take account furthermore of the extinct forms, the general conclusion is simply that the British fauna resembles that of the corresponding parts of the great Palæarctic region. See works by Wallace, Murray, Heilprin, etc.

Botany.—The British flora corresponds in a general way to that of the Continent, but appears to consist of several more or less distinct sets. The general resemblance may be shown by the fact that out of 117 plants recorded by De Candolle as characteristic of more than a third of the earth's surface, 100 occur in Britain. As to the various sets, Watson in his 'Cybele Britannica' (1847) distinguishes British, English, Scottish, Highland, Germanic, and Atlantic types; while Forbes (Mem. Geol. Soc., i. 336) also considered the vegetation of Great Britain as composed of outposts of several floras — from France, the Pyrenean region, Scandinavia, and other parts. Watson also distinguishes Agrarian and Arctic zones of distribution in Great Britain, each with three subdivisions marked by characteristic vegetation. The number of Phanerogams has been computed at 1,600 species, and there are probably at least twice as many Cryptogams. Among the very rare flowering plants, *Oxytropis campestris, Lychnis alpina, Astragalus alpinus, Saxifraga cernua, Eriocaulon septangulare* may be noted.

Transportation.— The prosperity of the country has been greatly furthered by all parts of the United Kingdom having been brought into easy communication with each other by means of roads, rivers, canals, and especially railways. On all of these sums of almost fabulous amount have been expended, and in the case of railways especially, nothing is more remarkable than the number of these which now traverse the United Kingdom in all directions; and which, particularly in the greater part of England and in central Scotland, cover the whole face of the country, and intersect one another at innumerable points. From 1825 to 1850, a period of a quarter of a century from the opening of the first railway, 6,621 miles of railway were constructed in the United Kingdom, being an average of 265 miles in each year. Between 1850 and 1860, 3,812 additional miles were constructed, giving an average of 381 miles in each year; and between the latter year and the end of 1881, 7,747 miles were constructed, being at the rate of 369 miles every year. The total mileage then amounted to 18,175, which by 1891 had increased to 20,191 miles. On 1 Jan. 1901, there were in all 21,855 miles of railway open in the United Kingdom, of which 15,187 miles belonged to England and Wales, 3,485 to Scotland, and 3,183 miles to Ireland. Of the total paid-up capital of £1,176,001,890, England and Wales absorbed £970,147,581, Scotland, £166,088,736, Ireland, £39,765,573. The net receipts of the railways of the three kingdoms were £89,392,501, £11,603,010, £3,806,347, respectively; total, £104,-801,858. When compared with other European countries, the United Kingdom is seen to stand fourth in point of the actual length of railways open, the first being Germany, the second and third France and Russia. When the number of miles of railway in proportion to the area of

the United Kingdom is compared with those of other countries, it occupies the position of second in order, for whereas the United Kingdom has only 17.4 miles of railway to every 100 square miles of surface, Belgium has 31.4 miles of railway to 100 square miles of surface. Belgium's total length of railways, however, is only 3,590 miles. The total length of tramways in the United Kingdom is fully 1,000 miles. The canals have a total length of over 3,800 miles.

Among the means of communication, in a somewhat different sense of the word, may also be mentioned the postal, including the telegraph, system of the United Kingdom. In the year 1901 2,323,600,000 letters were delivered in the United Kingdom, giving an average of about 57 per head of population. Of post-cards 419,000,000 and of book-packets, circulars, and newspapers 981,200,000 were delivered.

Since the transfer of the telegraphs to the state in 1870, the telegraph system has been greatly increased by additional lines and offices, and the business has increased in a still greater proportion. In 1901 the total length of telegraph wires in the United Kingdom was over 347,680 miles with 46,295 miles of line. The number of messages sent in the year was over 89,000,000. Of these some 75,000,000 were forwarded from offices in England and Wales, and over 9,280,000 from offices in Scotland. This department has also telephone exchanges in various towns, beside 60 miles of pneumatic tubing in London.

Agriculture. — Thorough and systematic draining, the extensive use of artificial manures, and the employment of the newest implements are among the chief features of modern British agriculture. A peculiar feature of English as distinguished from Scotch husbandry is the large amount of arable land in England forming permanent hayfields. These are kept fertile by heavy doses of farmyard manure. Although much of the land employed is naturally of poor quality, it produces a close sward of the richest green, furnishing admirable food for stock. The great extent of permanent pasture is also a feature of Irish agriculture. In the rearing and fattening of stock there is no country in the world that can be compared to several districts of Great Britain. Among breeds of horses, the race-horse, the "shire horse," the Suffolk punch, and the Clydesdale may be mentioned; among cattle, the shorthorn, the Hereford, the Aberdeen-Angus, and the Ayrshire; among sheep, the South Downs, Leicesters, Cheviots, and black-faces. The principal cereals grown in England are wheat, barley, and oats, occupying about equal areas; the principal green crops are turnips, potatoes, mangolds, vetches, etc. In Ireland and Scotland oats are the principal grain crop; the chief green crop being in Ireland potatoes, in Scotland turnips. Hops are grown largely in Kent, less extensively in some other parts of southern England. Of the whole area of Great Britain less than 60 per cent is under the plow or in pasture, but in England the proportion is about 75 per cent, and in Wales above 60 per cent, while in Scotland it is under 25 per cent (so much of Scotland being barren). In Ireland the proportion is about 75 per cent. Agriculture is there in a different condition from that of Great Britain, being in a very backward state on the whole, mainly owing to the subdivision of holdings and over-cropping, combined with ignorance and unskilfulness.

The following table gives a general idea of the distribution of crops in the United Kingdom:

Crops	England and Wales	Scotland	Ireland
	Acres	Acres	Acres
Under corn crops	6,128,911	1,271,424	1,105,026
Under green crops ...	2,513,878	619,592	1,390,941
Grasses under rotation, clover, etc.........	3,303,366	1,607,984	1,252,889
In permanent pasture	15,178,178	1,381,214	11,390,950
Fallow land...........	344,815	7,279	16,857

The total in crops, bare fallow, or grass thus amounted altogether to nearly 48,000,000 acres. The mountain and heath land furnishing pasture and not included in these figures is: For England, 2,249,164 acres; Wales, 1,187,404 acres; Scotland, 9,420,370 acres. The total number of agricultural holdings in Great Britain above one acre is about 520,000, in Ireland it is about 514,000.

The following table shows the number of horses used in or connected with agriculture, and of cattle, sheep, and pigs in the United Kingdom in 1901:

Animals	England and Wales	Scotland	Ireland
Horses	1,315,579	201,581	513,788
Cattle	5,376,089	1,246,284	4,486,242
Sheep	19,155,246	7,587,948	4,287,274
Pigs	2,317,479	134,116	1,253,682

In British farming a period of severe depression has prevailed since about 1875. For many years previous to this agriculture had been in the most flourishing condition, prices being high and large profits being made. Since then the reverse of this has been the case. Prices of almost all kinds of farm produce have fallen enormously, large numbers of farmers have been ruined, and others even at greatly reduced rents can scarcely make headway; while a good deal of land has gone out of cultivation. The main cause of this is the severe competition of foreign countries and British colonies, combined with bad seasons. In 1874 the average prices of wheat, barley, and oats were respectively, $13.38, $10.78 and $6.92. The average price of wheat per quarter in 1894 was only $5.48 — the lowest recorded for 124 years. The average price of barley was $5.88, the lowest since 1850, while the price of oats was $4.10. Recently there has been some improvement in prices of grain. The prices of beef, mutton, dairy produce, and wool have also undergone a great reduction during the period referred to. The result of the changed conditions has been that, while in 1871-5 the land under the plow in England and Wales annually averaged 13,696,000 acres, and that under pasture 10,217,000 acres, the figures for 1901 were as given above; the increase in pasture showing that farmers, on the whole, find it pays better to feed stock than to raise grain.

Minerals.—Such is the mineral wealth of the British Isles that, with the exception of quicksilver and gold, which, though found both in Great Britain and Ireland, are so limited in quantity as hardly to repay the labor for searching for them, it is scarcely possible to mention

a metal or mineral product of economical value which is not worked to a greater or less extent. Coal claims precedence, not merely because the annual output of it in regard both to quantity and aggregate value exceeds that of any other mineral product, but because without it the other natural resources of the country and the industry of its inhabitants must have forever remained in a great measure undeveloped. The coal fields are not confined to one particular district, but occupy a series of basins sometimes touching, but more frequently at a considerable distance from each other, and extending in an irregular curve from the Ochil hills to the Bristol Channel. Beginning with the farthest north limit, we find a coal field occupying a not inconsiderable part of Fifeshire and almost the whole of Clackmannanshire. The coal of this field is of several kinds; but the most important seams are splint, part of it of a free, open, burning quality, greatly in demand for steam navigation from its not corroding the furnaces and boilers, and part of it admirably adapted for the blast furnace. Part of this field, immediately to the west of Dunfermline, contains a coal which in its richness and quality of caking, bears a resemblance to that of Newcastle, and has been worked, as ancient records prove, for at least five centuries. On the opposite side of the Forth, and almost in visible communication with the field already described, another field extends over part of eastern Stirlingshire and a considerable portion of the Lothians. It furnishes the greater part of the fine fuel which is used in the metropolis of Scotland, and contains excellent seams of parrot coal. To the south are the coal basins of Lanark, Renfrew, and Ayrshire; the first much the largest, and famous throughout the world for the immense industrial establishments which it mainly has called into existence and made prosperous. On passing the border the Newcastle coal field lies before us, extending over a great part of the counties of Northumberland and Durham, and centring near Newcastle, which gives it its name. The proximity of this field to the sea, and the excellence of the coal, unrivaled for domestic use, early made it the great theatre of mining operations. The association of coals with Newcastle has long been proverbial. It is Durham, however, that now yields most of the coals, a larger quantity being mined here than in any other English county. This field furnishes a large proportion of the coal conveyed by sea both to home and foreign ports. The next coal field to the south is in many respects the most important of all. It includes a large central space, not entirely occupied by coal, but interrupted longitudinally by a broad belt which consists of the lower strata of the carboniferous system, and thus forming a kind of twin fields, the one of which extends from Leeds to Nottingham, while the other borders both on Manchester and Liverpool. This great coal area can boast, not only of being the seat of what has been termed the world's great workshop, but of furnishing the most essential elements both of its existence and prosperity. The only other coal field of a magnitude similar to those already mentioned is that of South Wales, which, though it long lay almost unknown or unheeded, has in comparatively recent times become the centre of great and varied industries, while Cardiff, as its maritime outlet, has risen to be a large town and the greatest coal-exporting seaport in the world. There are several other minor fields, all of them, with exception of that of North Wales, situated near the centre of England, and thus, from position as much as from extent, possessed of great value. Their names are: the North Staffordshire, the Shropshire, the South Gloucester and Somersetshire, the Warwickshire, and the South Staffordshire. The most important on the list are the North Staffordshire, the principal seat of the potteries, and the last two, Warwickshire and South Staffordshire. In South Staffordshire occurs the enormous seam known as the Ten-yard Coal of Dudley. It properly consists of several seams separated by very thin beds of clay. The output of coal in Great Britain, which in 1855 was only 61,453,079 tons, has been on the increase ever since. About a sixth part of the total produce is now usually exported to foreign countries or British possessions, and about the same consumed in the manufacture of iron. The following table shows the recent progress of the coal trade:

Years	Mined	Exported	Retained
1879	133,808,000	16,442,296	117,365,704
1889	176,916,724	28,956,445	147,960,279
1894	188,277,525	31,756,368	156,521,157
1898	202,054,516	36,562,796	165,491,720
1900	225,181,300	46,098,228	179,083,072

The value of the coal mined in 1900 was £121,652,596.

The iron ores smelted in Great Britain are principally carbonates, which are invariably found to a greater or less extent and in a great variety of forms, with very different qualities, in the coal measures. Yet more than two fifths of the ores now smelted are oxides (principally hematite and hydrated oxide). The most important iron districts yielding carbonates are those of Yorkshire, especially the rich Cleveland district in the North Riding, Shropshire, Staffordshire, South Wales, and the coal measures of Scotland. Hematite (red) is obtained chiefly in Lancashire and Cumberland; brown hematite to a smaller extent in South Wales and Cornwall. Hydrated oxide or brown iron ore is found principally in the counties of Northampton and Lincoln. Hematite is by far the richest of these ores, and hydrated oxide comes next in this respect. The following table shows the quantity and value of the pig-iron produced in the United Kingdom in some recent years:

Years	Quantities	Value
1879 ....Tons	5,995,337	£14,788,342
1889 .... "	8,322,824	20,390,918
1894 .... "	7,427,342	17,082,887
1900 .... "	8,959,691	....

Lead, tin, and zinc are the metals produced next in importance to iron. The value of the lead produced in the United Kingdom in 1900 was £349,094; of the tin, £523,604; of zinc, £97,606. Small quantities of copper and silver are obtained. An important article is salt, chiefly from rock-salt and brine pits, the quantity produced in 1900 being valued at £620,898. Salt is most extensively worked in Cheshire, and the supply is so great as to be inexhaustible. Quarries exist in almost every part of the British Isles. They furnish admirable building stone of various kinds, including in some localities

granite, which is employed for ornamental and other purposes. Limestone is plentiful, as are also clays of various kinds; and from Wales and other parts are obtained quantities of the finest roofing slates. The total value of coal and metals mined in 1900 was £135,957,676.

Fisheries.—The fisheries of the United Kingdom have long been of importance, and latterly their importance has considerably increased, larger vessels being now employed, and many of them propelled by steam. One great obstacle to the general consumption of fresh fish, namely, the difficulty to transport, is now much diminished by the facilities offered by the railways; and in some important inland towns, where fresh fish were previously known only as an expensive luxury, they can now be had at a price which places them within the general reach. The principal fresh-water fisheries are those of salmon, carried on chiefly in the rivers and estuaries of Scotland and Ireland. The chief sea-fisheries are those of herrings, haddocks, cod, and the various kinds of flat fish — plaice, soles, turbot, etc. The herring fishery is carried on on almost all the coasts and islands of Scotland, but especially on the east coast, the great centres of resort for curing being the towns of Wick, Peterhead, Fraserburgh, Aberdeen, etc. Many herrings are also caught on the east coast of England. The other fishes mentioned are caught all around the coasts, and especially in certain localities in the North Sea, one of the most famous being in the neighborhood of the Dogger Bank. Among minor fisheries may be mentioned those of mackerel, pilchards, oysters, and lobsters. The value of sea-fish caught in 1901 was £9,044,502; including shell-fish, £9,492,379.

Manufactures.—The manufactures of England began to establish themselves at a period long before those of Scotland came into existence. Tin is said to have been the first article of British commerce. The Phœnicians are generally said to have visited the coasts of England for the purpose of procuring tin.

Though of modern origin, cotton is the most important of British manufactures. The chief seat of the manufacture is in Lancashire, where Manchester and a number of other large towns, such as Oldham, Bolton, and Preston, are more or less supported, directly or indirectly, by this industry. The cotton manufacture of Scotland is on a comparatively limited scale, and is even of less importance than formerly. It chiefly centres in Glasgow and the surrounding district. Cotton thread is made extensively at Paisley. The importance of the cotton manufacture will be understood from the fact that it gives employment to about 529,000 persons, while the cotton goods exported (not to speak of those consumed in the country) form the largest individual export among the numerous exports sent by Great Britain to foreign countries. During the three years 1889–91 the annual export of cotton goods had an average value of fully £72,000,000; since that time it has somewhat decreased, the annual value in 1896–98 being a little over £66,000,000. The raw cotton imported has in recent years had a value of from £30,000,000 to more than £46,000,000 annually. The latter figure represents the value for 1891, while a larger quantity in 1898 was valued at only £34,000,000. The quantity imported which in 1820 only amounted to 152,000,000 pounds, amounted in 1901 to 1,830,305,904 pounds. Though the manufacture of woolen cannot boast of an extension like that of cotton, it holds the next place to it among textiles; and, besides working up the greater part of the wool grown within the kingdom, draws largely on other countries for additional supplies, particularly on the Australian colonies. In some branches the British manufacturers have formidable competitors on the Continent, but in others the position of the United Kingdom is at least as high as that of any other country, while in not a few the superiority is decided. The chief centres of the woolen manufacture are in England — the West Riding of Yorkshire (Leeds, Huddersfield, etc.), Lancashire, Gloucestershire, and Wiltshire being the most distinguished for broadcloths; Bradford and Norfolk for worsted stuffs; Leicestershire and Nottinghamshire for woolen hosiery. Blankets and flannels have numerous localities, but for the finer qualities the west of England and several of the Welsh countries are most conspicuous. Carpets of every quality and pattern are extensively made at Kidderminster, Halifax, Worcester, etc.; and Wilton and Axminster have given their names to famous fabrics of this kind. A modern branch of the woolen manufacture is that of shoddy. Its raw material consists of woolen rags, which, being reduced to the state of wool, are then remanufactured. The principal seat of the shoddy trade is the Leeds district.

The woolen manufacture of Ireland is yet on a rather limited scale, but seems to be making some progress. Among the goods made are blankets and flannels, friezes, tweeds, and serges — Irish wool being chiefly used. Scotland has made much more progress, but still bears no proportion to England. The chief seats of the Scotch woolens are Kilmarnock for carpets, bonnets, etc.; Glasgow for carpets, etc.; Stirling and its neighborhood for carpets and tartans; Galashiels, Hawick, Selkirk, and other places in the basin of the Tweed for shawls, plaids, etc., and still more for the kind of cloth known as "tweeds," the manufacture of which originated here, and which are also made at Dumfries and Aberdeen; Hawick for hosiery; Alloa for yarn. The woolen manufacture in all its branches gives employment to about 282,000 persons, while the value of the woolen and worsted manufactures (including yarn) exported from Great Britain has in recent years varied from more than £25,000,000 per annum to less than £20,000,000.

In England the spinning of flax into yarn and the weaving of the yarn into cloth is an old industry, and is carried on to a great extent, but is apparently not increasing. The chief seat of the manufacture is the West Riding of Yorkshire, the chief towns engaged in the industry being Leeds and Barnsley. Linen is the great staple of Ireland, where it is carried on chiefly in the province of Ulster (counties of Antrim, Down, Tyrone, etc.); and in Scotland also it was long the staple among textile fabrics. In the former, extraordinary means were employed to foster it. It early fixed its seat near Belfast, which continues to be its great centre.

The forms given to the manufactured flax in Ireland include not only plain linens, but also many of the finer varieties — lawn, cambric, damask, etc. In Scotland the manufacture also assumes great variety, embracing coarse goods such as osnaburgs, sheetings, sailcloth,

sacking, etc. — chief seat, Dundee; and diaper and damask — chief seat, Dunfermline. The staples of both towns are by far the most important of their kind in the kingdom; and the Dunfermline table-linens are not surpassed anywhere. Large quantities of jute goods have been manufactured for a considerable number of years, especially at Dundee. The value of the linen and jute manufactures (including yarn) exported in 1902 was £9,784,141.

In the case of silk, as in that of cotton, the raw material is entirely of foreign production. The chief source of supply is China, from which is obtained more than three fourths of the raw silk consumed in the United Kingdom; and after China the next countries in order of importance in this regard are France, Japan, and British India. The silk manufacture, however, can hardly be regarded as a very important British industry. The silk mills are confined chiefly to England, the chief seats being London, Manchester, Macclesfield, and Coventry. The silk manufactures exported are of trifling value compared with those imported.

The manufacture of machinery of all kinds is an extremely important branch of the industry of the United Kingdom, embracing steam engines, textile machinery, agricultural machinery, sewing machines, and various other descriptions. In 1902 steam engines of various kinds were exported to the value of £4,520,000; and the total exports of machinery were valued at £18,751,812. Here should also be mentioned plate and sheet iron, tin-plates, rails and railway materials, wire, bars, hoops, tubes, etc.; as well as guns and war materials, tools and implements of various kinds, telegraphic and electric apparatus. For minuter articles of hardware reference may be made to the countless products such as Sheffield and Birmingham produce, not excluding articles in the precious metals — plate, jewelry, and watches, made extensively in various places, but nowhere in the wide world so perfectly as in London. The exports of hardware and cutlery in 1902 amounted to £2,177,549; of steel and iron and other manufactures thereof to £24,641,516.

Very extensive are the manufactures of clothing, haberdashery, and millinery, and of vehicles, furniture, cabinet and upholstery wares. So also are the industries connected with earths, both in the more ordinary forms of pottery and in that of porcelain, with its classic shapes and gorgeous colors and exquisite designs, the Wedgwood being among the most widely known of such wares. The largest quantity of non-translucent earthenware is manufactured in Staffordshire. Among earths, at least as to principal constituents, we may include glass in its various forms, the principal of which are window glass and bottles.

Another notable manufacture is that of paper in all its different varieties. In connection with it are various industries, of which it may be considered as, directly or indirectly, the parent — type-founding, printing, books, newspapers, and with them literature in its various departments, engraving, etc. Besides the various classes of paper and stationery exported there is of course an immense consumption at home. Among other important miscellaneous manufactures are those of chemicals, manures, leather and leather goods (boots and shoes, saddlery), india-rubber goods, floorcloths, etc. Here may also be mentioned preserved provisions in great variety, confectionery, spirits, and ales.

The chief seats of British ship-building are Glasgow and other Clyde ports, Newcastle and other Tyne ports, Sunderland, Hartlepool, Belfast, Stockton, Middlesborough, London, and Barrow-in-Furness. The output for 1900 was 665 sailing vessels, with a net tonnage of 41,839; 705 steam vessels, with a net tonnage of 654,158 (1,079,583 tons gross); or in all, 1,370 vessels, with a total net tonnage of 695,997. Besides these there were built for foreigners 196 sailing and steam vessels, having a total net tonnage of 207,452 tons; the steamers numbering 165, with a net tonnage of 171,560 and a gross tonnage of 278,955.

Commerce.— Of the extent of the commerce carried on by railway, river, canal, and highway there are no means of forming a just estimate, though it must be of enormous extent. The foreign trade, or commerce properly so called, is more easily calculated, at least in all its leading branches. The following table will show the progress it has made, and the extent it has attained:

EXPORTS.

Years	Imports	British Produce	Foreign & Colonial Produce	Total Exports
	£	£	£	£
1856....	172,544,154	115,826,948	23,393,405	139,220,353
1873....	371,287,372	255,164,603	55,830,162	310,994,765
1880....	411,229,565	223,060,446	63,354,020	286,414,466
1883....	426,891,579	239,799,473	65,637,597	305,437,070
1892....	423,892,178	227,060,224	64,400,420	291,460,644
1897....	451,238,683	234,350,003	59,833,677	294,183,680
1901....	522,238,986	280,498,889	67,846,843	870,584,718

In 1856 the imports per head of the population amounted £6, 3*s*, 2*d*; the exports of British produce, to £4, 2*s*, 10*d*. In 1901 the amounts were respectively £12, 11*s*, and £6, 14*s*, 10*d*.

The chief articles and values of the imports and exports in 1901 were:

IMPORTS.

Animals, living (for food)	£ 9,400,033
(a) Articles of food and drink duty free.	162,949,666
(b) Articles of food and drink dutiable.	47,595,501
Tobacco, dutiable	4,819,473
Metals	30,787,452
Chemicals, dyestuffs, and tanning substances	6,129,559
Oils	11,030,606
Raw materials for textile manufactures..	70,401,772
Raw materials for sundry industries and manufactures	57,954,510
Manufactured articles	93,609,754
(a) Miscellaneous articles	17,298,198
(b) Parcel post	1,262,462
Total	£522,238,986

EXPORTS.

British produce.	
Animals, living	£ 742,499
Articles of food and drink	14,884,915
Raw materials	33,977,644
Articles manufactured and partly manufactured, namely:	
(a) Yarns and textile fabrics	103,471,561
(b) Metals and articles manufactured therefrom (except machinery)	39,413,762
(c) Machinery and mill work	17,855,335
(d) Ships, new (not registered as British)	9,159,876
(e) Apparel and articles of personal use.	10,940,060
(f) Chemicals, and chemical and medicinal preparations	8,942,109
(g) All other articles, either manufactured or partly manufactured	38,068,759
(h) Parcel post	3,642,369
Total British produce	£280,498,889
Foreign and colonial produce	67,846,843
Total	£348,345,73[illegible]

The registered sailing vessels engaged in the home trade of the United Kingdom were in 1900, 6,203; their tonnage 378,957; their crews numbered 23,734. The steam vessels in the home trade were 3,545, with a tonnage of 508,359, and crews numbering 40,288 men. The vessels engaged partly in the home, partly in the foreign trade, numbered 401, their tonnage 217,478, and their crews 5,649. The sailing vessels in the foreign trade were in 1900, 1,143, of 1,594,838 tons, and 25,856 men; steam vessels 3,648, burden 6,695,575 tons, crews 151,921. The total number of vessels employed in the trade of the United Kingdom was thus 14,935, with an aggregate burden of 9,395,207 tons, and crews numbering in all 247,448. The total number of vessels registered as belonging to the kingdom was 19,982 of 9,304,108 tons.

Export Statistics.—A comparison of figures of domestic exports of the leading nations of the world, bring out some interesting facts:

DOMESTIC EXPORTS, 1870.

United Kingdom	$971,000,000
Germany (1872)	552,000,000
France	511,000,000
United States	377,000,000
India	255,000,000
Russia	216,000,000
Austria-Hungary	192,000,000
Netherlands	154,000,000
Italy	146,000,000
Belgium	133,000,000

DOMESTIC EXPORTS, 1890.

United Kingdom	$1,282,000,000
United States	845,000,000
Germany	792,000,000
France	724,000,000

DOMESTIC EXPORTS, 1902.

United Kingdom	$1,379,000,000
United States	1,392,087,672
Germany	1,113,000,000
France	818,000,000
Netherlands (1901)	696,000,000
India	408,000,000
Austria-Hungary	388,000,000
Belgium	358,000,000
Russia (1901)	369,000,000
Italy	284,000,000
Brazil (1901)	197,000,000
Switzerland	169,000,000
Argentine	173,000,000
Spain	142,000,000
China	135,000,000
Japan	127,000,000
Sweden (1901)	95,000,000
Chile (1901)	63,000,000
Norway	46,000,000
Mexico	42,000,000

Great-crested Flycatcher, a large flycatcher (*Myiarchus crinitus*), which is a summer visitor to all parts of temperate North America, and is noted for its shrill, yet musical scream, and for its habit of entwining one or more cast-off snake-skins in its large tree-lodged nest. It is olive-brown above, with an ashy head surmounted by a tall brownish crest, and the lower parts delicate yellow. Several other species belong to the southwestern States and Mexico, and are often called crested kingbirds.

Great Dane, a breed of large, smooth-coated dogs, the modern equivalent of the ancient boar-hound. See DOG.

Great Divide, The. See DIVIDE, THE GREAT.

Great Eastern, a British iron steamship, before the Celtic the largest vessel constructed, built (1854–8) at Milwall, on the Thames, for the Eastern Steam Navigation Company, by Scott Russell, from plans by I. K. Brunel; length 680 feet; breadth, 82½, or, including paddle-boxes, 118 feet; height, 58 feet (70 to top of bulwarks). She had 6 masts, 5 of iron and 1 of wood, and could spread 7,000 yards of sail, besides having 8 engines, divided between her screws and paddles, and capable of working at 11,000 horse-power. From the first her career was unfortunate, the launching process alone lasting three months and costing $300,000. After several unremunerative trips to New York she was employed first as a troop-ship, and then as a cable-laying ship, for which her size and steadiness specially qualified her. Various attempts were afterward made to utilize her, but she at last came to be a mere holiday spectacle, and was broken up in 1888.

Great Expectations, a novel by Charles Dickens, published in 1861. As in 'David Copperfield,' the hero tells his own story from boyhood. Owing to the simplicity of the plot, and to the small number of characters, it possesses great unity of design. These characters, each drawn with marvelous distinctness of outline, are subordinated throughout to the central personage "Pip," whose great expectations form the pivot of the narrative.

Great Falls, Mont., city, county-seat of Cascade County; on the Missouri River, the Great Northern, and the G. F. & C. Railways; 120 miles northeast of Butte. South and nearby is a great mining region and north is an agricultural and grazing section. It has large gold, silver, and copper smelters, and bituminous coal, lead, iron, and sandstone are found in the vicinity. The excellent water power which the city possesses is an inducement to manufacturers to establish works in Great Falls. There are a number of falls here; one, Great Falls, gives name to the city. The first settlement was made in 1884, and in 1888 Great Falls was incorporated. Its rapid growth has been largely the result of its natural resources. Its chief manufactures are flour, furniture, mining and agricultural instruments, wagons, carriages, and woolen goods. The population increased from (1890), 3,979 to (1900) 14,930.

Great Horned Owl. See EAGLE OWL.

Great Island. (1) A small island at the entrance to Portsmouth Harbor, N. H. It has a lighthouse 90 feet high. (2) An island in Bass Strait, between Tasmania and Australia. It is about 40 miles long and 12 miles broad. Pop. 42,100.

Great Kanawha, ka-nâ'wa, a tributary of the Ohio River, has its rise between the Blue Ridge and Iron Mountains in the northwestern part of North Carolina, flows northeast by north through the southwestern part of Virginia, then changes its course northwest and west into West Virginia, and flows into the Ohio River at Point Pleasant. It receives the Gauley River in Fayette County, West Virginia, and from thence to its mouth is known by the name of Great Kanawha. The river, at a cost of over $4,000,000, has been made navigable from th Ohio to Great Kanawha Falls, about three miles from the mouth of the Gauley River. It is about 450 miles in length.

Great Kanawha, Battle of. See POINT PLEASANT.

Great Lakes, the name given to the chain of lakes on the northern border of the United States. They include Lakes Superior, Michigan, Huron, Saint Clair, Erie, and Ontario; Michigan only lying wholly within the United States, and no one of the lakes wholly within the territory of the Dominion of Canada. Their area is about 90,000 square miles; elevation, Lake Superior 600 feet above the sea, and Lake Ontario 250 feet. The fall of Lake Superior to Lake Erie is about 40 feet. No large river flows into the Great Lakes; the Saint Lawrence River is the outlet. The basin of the Great Lakes averages in width about 100 miles north and south of the north and south shores respectively. The combined coast lines in the United States have a shore line of about 3,075 miles. These great inland seas constitute the largest body of fresh water in the world. Like all large bodies of water they affect the climate of the surrounding country. Good farms, extensive forests, and valuable minerals are found along the coast. On the southern shore of Lake Superior (q.v.) are found masses of ore and low mountains apparently of eruptive origin. The Great Lakes have been the means of developing to a considerable extent the Northwest, as they are the main thoroughfares by which the products of the large farms, the cattle ranches, the mines, and the forests have been brought to eastern markets. Coal and manufactured products of the east pass over the lakes to western markets. The bituminous coal tonnage of the lakes for 1899 was 9,000,000 tons. In the same year the net freight tonnage of Sault Ste. Marie's Falls canal was over 25,000,000 tons, or three times the amount which passed through the Suez Canal. The iron ore tonnage for 1900 was 20,000,000 tons. There are 20 individual ports on the Great Lakes which have a registered tonnage ranging from 1,000,000 to over 5,000,000 tons. Cleveland's tonnage alone, in 1902, was 5,037,282 tons; and the same year New York's tonnage was 8,982,767 tons. The line of cities around the Great Lakes are (1903) increasing in commercial importance and population with more rapidity than any group of cities in any other part of the world. Some of those lake ports, all terminals of railroad trunk lines, are Toledo, which increased 61 per cent from 1890 to 1900; Chicago, which increased in the same time 54 per cent; Cleveland, 46 per cent; Milwaukee, 39 per cent; and Buffalo, 37 per cent. The question of locating a dam at the outlet of Lake Erie so as to benefit navigation has been under consideration, and efforts are being made (1903) to have commissioners appointed by the governments of the United States and Great Britain who will work together, and report upon the conditions and uses of the waters adjacent to the boundary lines between the United States and Canada. In June 1903, the Congress of the United States took action regarding the matter, and empowered the President to appoint three American Commissioners; one to be an engineer officer of the army; another, a civil engineer, «well versed in the hydraulics of the Great Lakes;» the third, a lawyer «of experience in questions of international and riparian law.» The necessity of such a commission to examine even the variations in the levels of the waters of this great thoroughfare is manifest when the levels of Detroit River, Lake Saint Clair, Saint Clair River, and Saint Mary's River have been lowered by the Government twenty-one-foot channels from Duluth and Chicago to Buffalo. The Chicago Drainage Canal (see Chicago) has helped to lower Lake Michigan. The Consolidated Lake Superior Company is taking water out of Saint Marys River. Other causes are making a change of level, and the increased transportation on all the lakes, will mean better channels to the ocean. For canals connecting the Great Lakes with rivers and the two around water-falls, see articles on the respective lakes.

Great Meadows, Pa., Engagement at, 28 May 1754; Washington's first fight. When the French built Fort Duquesne (now Pittsburg), driving off an English force which had begun to fortify the same spot, it was evident that the decisive struggle for mastery of the American «hinterland» was to begin; and the commander of the nearest English force, a Virginia militia officer of 22, named George Washington, at once sent a messenger to Gov. Dinwiddie and wrote letters to the governors of Pennsylvania and Maryland, urging all to send troops and expel the French. Meantime he set out with his force to build a fort on the Monongahela where Brownsville, Pa., now stands. Constructing a road as he went, he halted at the Great Meadows of the Youghiogheny, a bushy field at the foot of Laurel Hill,— a good camping-place and defensible position. Hearing from his scouts that the French had learned of the English activity, and sent out a party to engage any English band they met, he cleared the field of bushes and threw up an intrenchment behind a ravine crossing the field; but instead of waiting an attack, took 40 men for a night surprise of the French, guided by Indian allies. It was raining hard, the path was often lost, and he did not reach the French camp till morning. They were an advance party of 32, sent out to reconnoitre and, hearing of Washington's advance, they had hidden in a rocky hollow and sent back for reinforcements, but attempting defense when surprised, the commandant — Ensign Jumonville — and nine men were killed, and the rest captured and taken to the camp at Great Meadows. Washington lost one killed and three wounded. The sequel is told under FORT NECESSITY.

Great Pacificator, a name given Henry Clay (q.v.), on account of his efforts to reconcile the conflicting interests of North and South, especially in connection with the Missouri Compromise.

Great Pedee, a river which has its rise in the mountains of the northwestern part of North Carolina, flows south and east across the State, and enters South Carolina at Marlboro County, in the northeastern part of the State, then flows southeast into Winyaw Bay, an inlet of the Atlantic. In North Carolina the river is called Yadkin. About where the Little Pedee joins the Great Pedee, and south to its mouth, there are several quite large islands. The river is navigable for a distance of about 150 miles from Winyaw Bay.

Great Salt Lake, a body of water in the northwestern part of Utah, the principal drainage centre of the Great Basin (q.v.); bounded on the east by the Wasatch Mountains, on the west by the Great Salt Lake Desert. It is about 4,200 feet above sea-level, 80 miles long and from 20 to 32 miles wide. Its chief inlets are the Bear, Ogden, and Weber, and the Jordan which brings the fresh waters of Lake Utah. Great Salt Lake has no apparent outlet save evaporation. In 1850 the amount of saline matter held in solution was 22.4 per cent, in 1869 only 14.8 per cent. Between these dates the amount of water flowing in annually exceeded the evaporation, and the lake increased in area from 1,700 to 2,360 square miles. Since 1869–70 the lake has been receding. One cause of the water diminishing in volume is the amount used for irrigation; but the amount of water contributed by the inlets has decreased since 1870. At one time Great Salt Lake was much larger than it is now. The bars, cliffs, and beaches formed by the waters of the ancient lake (called Lake Bonneville) are plainly visible along the base of the mountains. Lake Bonneville had an area of 19,800 square miles and a depth of 1,100 feet. Its depth near where the great Mormon Temple now is was about 850 feet. Its dry bed is now occupied by nearly 200,000 people. The waters of Lake Bonneville reached the ocean through Columbia River. Geological investigations show that there have been at least two moist periods with intervening and subsequent periods of dryness. A change from the present dry climate and scant rainfall to a moist climate would result in a great increase in area of the waters in the lakes and rivers and a return to former water areas. Great Salt Lake has several islands, the largest of which Antelope, is 18 miles long. No fishes seem to exist, but several species of insects and brine-shrimps have been found in the waters; and water-fowls in large numbers frequent the shore. The first mention of Great Salt Lake appeared in a report made by the Franciscans, in 1776. Father Escalante and companions seem to have traveled from Mexico to this region. A report made also by the Franciscans early in the 17th century mentions the large rivers and lakes and the mineral wealth of this section. In 1843 Fremont explored and described this region, and a thorough survey was made in 1849–59 by Howard Stansbury, captain in the United States Army. (See UTAH.) Consult: 'Jesuit Relations'; Bancroft, 'Utah'; U. S. Reports and Surveys.

Great Slave Lake, a body of water in the Canadian Northwest Territory, lat. 62° N.; greatest length about 300 miles, greatest breadth 50 miles. Estimated area, 10,100 square miles. By the Great Slave River it receives the waters of Lake Athabasca; and the outlet is the Mackenzie River which flows into the Arctic Ocean.

Great Slave River, in Canada, is the outlet of Athabasca Lake and flows into Great Slave Lake (q.v.), by two mouths, near Fort Resolution. A number of falls and rapids are in its upper course, but the descent becomes more gradual near its mouth. Length about 300 miles.

Great South Bay, an arm of the Atlantic Ocean on the southern coast of Suffolk County, Long Island, N. Y.; 50 miles long, from one and one-half to five miles wide. Great South Beach, which is about 35 miles long, has Fire Island lighthouse on the western extremity, and separates the bay from the ocean.

Great Stone Face, one of Hawthorne's short stories relating to the "Old Man of the Mountain" in the White Mountains, in 'Snow Image and Other Twice Told Tales' (1852).

Greatorex, grāt'ō-rĕks, **Eliza Pratt,** American artist: b. Manor Hamilton, Ireland, 25 Dec. 1819; d. Paris, 9 Feb. 1897. She studied art in New York and Paris. Her work began in landscape painting, but pen and ink work and etching subsequently absorbed her efforts. In 1868 she was elected associate of the National Academy. In 1870 she visited Germany and in 1871 published 'The Homes of Oberammergau.' Her principal works are 'Summer Etchings in Colorado' (1873) and 'Old New York from the Battery to Bloomingdale' (1876).

Grebes, grēbz, a well-defined group of water-bird (*Colymbidæ* or *Podicipidæ*) comprising 25 species, spread over practically the whole world. The grebes are peculiar in having the legs placed very far back, in their flattened tarsi and lobed (not webbed) toes, each digit being flattened and bordered by an extension of horny skin. They are expert swimmers and pre-eminent as divers. They nest in secluded ponds and bogs, piling up a mass of vegetable matter upon some floating foundation, and deposit chalky white eggs. When the female leaves the nest she usually covers the eggs over with vegetable matter. The little grebes are expert swimmers and divers from the time they are hatched, and in their soft downy plumage are exceedingly beautiful. During migrations grebes are found frequently along our rivers and sea coasts, and are often shot by duck hunters in the autumn and winter. Though they have no stiffened tail feathers, and have relatively very small wings, they are able to fly long distances. The body plumage is soft and compact, and that of the under surface is a beautiful silvery white, which makes "grebe-breasts" a very desirable article in the millinery trade. The best-known species in eastern North America are the horned grebe (*Colymbus auritus*) which has a peculiar ruff of black and rusty feathers about the head; and the pied-billed grebe (*Podilymbus podiceps*) a rather more heavily built bird without a ruff and with a thicker and shorter bill. Both are popularly known as "hell-divers." In Europe the common species are the horned grebe, the great crested grebe (*C. cristatus*) and the dabchick (*C. fluviatilis*).

Greece, Ancient, the European peninsula which was bounded on the north by Macedonia and Illyria; on the east and southeast by the Ægean and Myrtoan, and in the west, and southwest, by the Ionian seas. Its length from the borders of Macedonia to Cape Tænarum was about 262 miles. The name of *Græcia* originated in Italy, and was probably derived from Pelasgian colonists, who, coming from Epirus to Magna Græcia, in southern Italy, and calling themselves *Græci,* occasioned the application of this name to all the people who spoke the same language with them. In earlier times, for example, in the time of Homer, Greece had no general name among the natives. Aristotle was the first Greek to call his countrymen **Γραικοί**, Greeks. It afterward received the name of *Hellas,* and still later, after the country was conquered by the Romans, it was divided into two provinces: the Peloponnesus being known as Achaia, and the remaining regions to the north as Macedonia. The Grecian tribes were so widely dispersed that it is difficult to determine with precision the limits of Greece, properly so called. The name perhaps is properly applied only to the country lying to the south of Macedonia, with the adjacent islands; but it has sometimes been given in a modern sense by geographers to the whole territory lying to the south of Mount Hæmus, Mount Scomius, and the Illyrian Alps, or the whole series of mountains now called the Balkan, so as to include regions inhabited by some Thracian, Macedonian, and Illyrian tribes. The area of the mainland of the more limited region to which the name of Hellas is properly confined is above 55,000 square miles. The whole of Greece naturally divides itself into three parts: Northern Greece, including Epirus and Thessaly; Central Greece, which comprises what was known as Hellas; and the Peloponnesus.

Physical Features.— The first thing which strikes the eye on looking at a map of Greece is the comparatively great extent of its coastline, formed by numerous gulfs which penetrate into it in all directions, and give it a remarkably broken and rugged appearance. Proceeding round the coast from the northwest to the northeast we are presented in succession with the Ambracian Gulf (now Gulf of Arta), Corinthian Gulf (the mouth of which is now called the Gulf of Patras, while the name of Gulf of Corinth is reserved for the inner part of it), the Cyparissian (now Arcadian) Gulf, and the Messenian, Laconian, Argolic, Saronic, Maliac, and Pagasæan gulfs, now called respectively Koron, Marathon, Nauplia, Athens, Lamia, and Volo. The Corinthian Gulf on the east, and the Saronic Gulf on the west, which nearly meet at the Isthmus of Corinth, divide Greece into a continental and a peninsular portion, the latter called the Peloponnesus (now Morea). Another striking feature is the mountainous character of the interior. The whole country was bounded on the north by a range of mountains, the western half of which was called Mount Lingon and the eastern half the Cambunian Mountains, with Mount Olympus at their eastern extremity. From about the middle of this range a lofty chain, called Mount Pindus, strikes southward and runs almost parallel to the eastern and western coasts of Greece. At a point in this chain called Mount Tymphrestus or Typhrestus (now Mount Velukhi), two chains proceed in an easterly direction, the northernmost of which, Mount Othrys, runs almost due east, and attains at some points a height of from 7,000 to 8,000 feet, while the southern one runs rather in a southeasterly direction, attaining at one point a height of 8,240 feet, and terminates at the celebrated pass of Thermopylæ. The Cambunian Mountains on the north, the range of Pindus on the west, and Othrys on the south, enclose the large and fertile vale of Thessaly, forming the basin of the Peneus (now Salambria), and the ranges of Othrys and Oeta enclose the smaller basin of the Sperchius (Hellada). Another range of mountains branches off from Mount Œta and runs still more to the south. This is the celebrated Parnassus, which, at its highest point, exceeds 3,000 feet. The peaks of Cithæron, Parnes, Pentelicus, and Hymettus lie in the same direction, but are more distinguished for their classic celebrity than for their height. The range in which these peaks are found is continued to the southeast point of continental Greece, and the islands of Ceos, Cythnos, Seriphos, and Siphnos (now Kea, Thermia, Serpho, and Siphanto) may be regarded as continuations of it. This range on the south and that of Œta on the north enclose the basin of the Cephissus, with Lake Copais (now Topolia). Another chain of mountains strikes southwestward from the central range of continental Greece, under the names of Corax and Taphiassus. The chief rivers on the west side of the Pindus chain are the Arachthus (now Arta) and the Achelous (now Aspropotamo).

The chief feature in the mountain system of the Peloponnesus is a range or series of ranges forming a circle round the valley of Arcadia in the interior, having a number of branches proceeding outward from it in different directions, dividing the rest of the Peloponnesus into several other valleys. The loftiest part of the mountainous circle round Arcadia is that lying to the north, with the peak of Cyllene (Ziria), 7,789 feet high, at its eastern extremity, and Erymanthus (Olonos), 7,297 feet high, at its western. The southern part consists rather of a series of heights than a chain of mountains. The highest range which branches off from the circle around Arcadia, and, indeed, the highest range in the Peloponnesus, is Mount Taygetus (Pentedactylon), which strikes southward, separating the ancient divisions of Messenia and Laconia, and terminating in the promontory of Tænarum (now Cape Matapan). The other chains are of no importance. The only rivers in the Peloponnesus of any consequence are the Eurotas (Iri), draining Laconia on the southeast; the Pamisus (Pirnatza), draining Messenia on the southwest; the Alpheus (Ruphia), draining Arcadia and Elis; and the Peneus (Gastuni) draining Elis on the west.

The rock most largely developed in the mountains of Greece is limestone, which often assumes the form of the finest marble. Granite and gneiss are found only in the north, in the eastern ramifications of the Pindus. Tertiary formations prevail in the northeast of the Peloponnesus; and in the northwest, along the shores of Elis, are considerable tracts of alluvium. Volcanic rocks are not seen on the

mainland, but form considerable masses in some of the islands. Attica was rich in silver and marble. The quarries of Pentelicus and the mines of Laureium were famous. Gold and serpentine were found in Siphnos; there was tin in Ceos, and copper near Chalcis in Eubœa. In many of the islands iron abounded.

Divisions.— On the northwest of the mainland of Greece was the mountainous region of Epirus, which was never more than half Greek; and to the east of that district, separated from it by the chain of Pindus, lay Thessaly, a region of fertile plains. To the south, lay a series of small independent states. Reckoned from west to east, there were Acarnania, Ætolia, Doris and Locris, Phocis with Mount Parnassus, the seat of the Muses, and the sacred Delphi, regarded by the Greeks as the navel of the earth; Bœotia, with Helicon, another mountain sacred to the Muses, and with the cities of Thebes and Platæa; Megaris, containing the city of Megara; and Attica with its capital Athens, Piræus, the port of Athens, and the city of Eleusis, the seat of the mysterious worship of Demeter. In the middle of the Peloponnesus was Arcadia, with the towns of Mantinea, Tegea, and Megalopolis, the last founded by Epaminondas. In the north lay Sicyon and Corinth, the latter situated on the isthmus connecting the Peloponnesus with the rest of Greece; and to the west of that Achaia. To the southwest of Achaia lay the rich province of Elis, with the plain and sacred grove of Olympia, celebrated on account of the Olympic games, which were held here every fourth year. To the south of Elis, in the southwest corner of the Peloponnesus, lay the province of Messenia, with the famous stronghold of Ithome, "one of the horns of the Peloponnesus," the fort of Pylos, and later the capital town of Messene, founded by Epaminondas 369. Separated from Messenia by the range of Taygetus was the province of Laconia, occupying the southeast corner of the Peloponnesus, and containing the renowned city of Sparta, long the rival and ultimately the conqueror of Athens. Lastly, to the north of Laconia, the east of Arcadia, and the south of Sicyon, lay the province of Argolis, with the capital Argos, and the cities of Mycenæ and Tiryns, all remarkable for the remains of gigantic works of masonry, commonly known as Cyclopean works.

The islands of Greece are partly scattered over the Ægean Sea and partly contained in the Ionian Sea on the southwest of the mainland. The Greeks applied the names Cyclades and Sporades to two groups of islands in the Ægean, the former name (from *kuklos*, a circle) to those which they believed to form a circle round the sacred island of Delos, and the latter (from a Greek root meaning scattered, sporadic) to those which were scattered over various parts of the sea. Some islands were sometimes said to be in the one group and sometimes in the other, and several were sometimes excluded from both. The following, however, are the principal of those which may most properly be considered as belonging to the Cyclades: Andros, Tenos, Myconos, Naxos (now Naxia), Paros (celebrated for its marble), Amorgos, Anaphe, Thera (now Santorin), Pholegandros (now Polykandro), Sicinos, Ios (now Nio), Melos, Syros, and Gyaros (Jura), Siphnos, Seriphos, Cythnos, and Ceos. The name Sporades may be applied to all the other islands in the Ægean. The Sporades will thus include the following islands on the northeast of the mainland of Greece: Eubœa (Negropont), the largest of all the Greek islands, separated from the continent only by the narrow strait of Euripus, and containing the ports of Chalcis and Eretria; Sciathos, Scopelos, Halonesus (Kilidromi), Eudemia (Sarakino), and Scyros; the following off the coasts of Thrace and Asia Minor: Lemnos, Thasos, Imbros, and Samothrace (in very remote times the seats of a mysterious religious worship) Lesbos (with the flourishing and luxurious town of Mitylene), Chios, Samos, Cos, etc.; and the following in the Saronic Gulf, or between it and the Argolic Gulf: Salamis (now Salamis or Koluri), Ægina, Calauria (Poros), Hydrea (Hydra), and Pityussa (Spetsæ). The islands in the Ionian Sea are Corcyra (Corfu), celebrated in the most ancient times for its wealth and culture, and at a later period colonized by Corinthians; Paxos, Leucas or Leucadia (Santa Maura), at one time connected with the mainland; the "rocky" Ithaca (now vulgarly called Ithaki), the home of Ulysses; Cephallenia (Cephalonia), Zacynthus (Zante), and Cythera (Cerigo), one of the seats of the worship of the goddess Aphrodite.

Soil, Productions, Etc.— Greece was in ancient times more fertile than it is now, which is accounted for by the fact that the forests have been to a large extent cleared away, the springs thus dried up, and the soil deprived of moisture. The most fertile districts were Thessaly, Bœotia, and some parts of the Peloponnesus; the least fertile Attica and Arcadia. The principal objects of cultivation were the vine and the olive, but flax and the commoner cereals were also cultivated more or less. Among the domestic animals were horses, asses, mules, oxen, swine, sheep, goats, and dogs. Swine were very numerous everywhere, and mules were much used in the Peloponnesus; but there were comparatively few horses, as the mountainous character of the country was not conducive to their being reared; the best horses of Greece were reared in Thessaly. Bears, boars, and wolves are mentioned among the wild animals anciently found in Greece, and it may perhaps be inferred from the legend of the Nemean lion that even lions at one time existed in this country. Herodotus, indeed, expressly states that lions were found between the Nestus in Thrace and the Achelous in Acarnania.

Climate.— The climate of ancient Greece is highly commended by ancient Greek writers, as by Herodotus, Hippocrates, and Aristotle, on which account it seems fair to infer that the malaria which now infests the air in summer did not then prevail to the same extent, a circumstance that is easily accounted for by the fact that in those times the country was more thickly populated and better cultivated. In respect of temperature the same differences resulting from the inequalities of the surface must have existed then as exist now, long and severe winters being experienced in the highlands of the interior, while the lowlands, exposed to the sea, enjoyed warm and genial weather all the year round.

History.— Greece has never at any period formed a single and independent state. As long as it remained independent it was divided into a number of separate states, and during

the only period when it was administered as a single territory it was subject to a foreign power. A general sketch of the history of ancient Greece must therefore touch only upon those leading events which belong to the common history of the Greek states, or which at least affected the Greek people as a whole, even although they may belong more especially to the history of an individual state.

The earliest inhabitants of Greece of whom anything is known are called by Greek writers Pelasgians. The ethnological affinities of these have often been discussed, but the most recent authorities believe that they were an Indo-Germanic or Aryan people. They occupied Greece before the influx of Ionians, Æolians and Dorians. They seem to have been agricultural in pursuits, dwelt along the fertile valleys, built strong cities, walls of the so-called cyclopean masonry, and among their most famous seats were Dodona in Epirus, Thessaly, Orchomenos in Bœotia, Mycenæ in Argolis, Sicyon, etc.

In religion they abhorred both polytheism and anthropomorphism. Their name afterward became changed to Hellenes and under this appellation they amalgamated with the Ionians, the Achæans, the Æolians and the Dorians. The early relations of Greece with the East are perhaps reflected in the legends of Oriental colonists — Cadmus, Pelops, Cecrops, etc. — who settled in Greece in very remote times. The reality of an early connection between Greece and the East is established by the fact that the Greeks derived the greater part of their alphabet from the Phœnicians.

The Hellenes, or Greeks properly so called, entering the country probably from the northwest, subdued and partly displaced the Pelasgians. They are usually represented as having been divided into four chief tribes — the Æolians, occupying the northern parts of Greece (Thessaly, Bœotia, etc.); the Dorians, occupying originally only the small region in the neighborhood of Mount Œta; the Achæans, occupying the greater part of the Peloponnesus; and the Ionians, occupying the northern strip of the Peloponnesus and Attica. The middle part of the Peloponnesus was still mainly inhabited by a Pelasgic population. The warlike and enterprising character of these Hellenic invaders is evidenced by the poetic legends of their achievements in the heroic ages, such as the tale of the Trojan War, of Theseus, of Jason and the Argonauts, etc. From all these we may gather at least that the Hellenes early distinguished themselves by building towns, making long voyages, planting distant settlements, and carrying on foreign wars. As in later times, they were divided into numerous states, each consisting of a single city with the surrounding territory. These states were governed by kings who were the heads of the supreme families, and who traced their descent from Zeus. By the side of the kings stood the heads of the other leading families of the state, who in Homer are also called kings, and likewise boasted of a descent from Zeus. In the public market-place (agora), where all the affairs of the state were transacted, these subordinate kings gave their opinions on every subject of deliberation, and advised the supreme ruler as to the course he should pursue, but beyond that they had no authority. Their influence, however, was very great, especially where the rightful head of the state did not possess the abilities of a ruler.

The distribution of the Hellenic tribes which we have just indicated is not that which continued throughout the main period of Greek history. It was entirely altered by an event called the Dorian migration, or sometimes the return of the Heracleids, which is placed by Thucydides about 80 years after the fall of Troy, and thus about the year 1104 B.C., according to the ordinary system of chronology. Before the great migration several smaller ones had taken place. One tribe, finding its territory too circumscribed, would move to another, expelling the inhabitants already settled there, who thus found themselves compelled to remove to some other district, where they treated the original inhabitants in the same way that they had been treated themselves. In this way there arose a general disturbance, till at last the hardy Dorian inhabitants of the mountainous region about Mount Œta began a migration on a greater scale than had hitherto been attempted, and thus brought about a series of changes which resulted in an entirely new settlement of the Greek territory. They first conquered a large part of northern Greece, and then entered and subdued the greater part of the Peloponnesus, driving out or subjugating the Achæans, as the Achæans had driven out or subjugated the Pelasgians. The Dorians are also said to have invaded Attica, where, however, they were baffled, according to the legend, by the self-devotion of Codrus, the king of that territory. It is said that an oracle had pronounced that in this war whichever side lost its king would be victorious, on which account strict orders were given to the Dorian soldiers to spare the life of the king of the enemy. But Codrus disguised himself in the dress of a common herdsman, and going into the enemy's camp provoked a quarrel in which he met his death, on learning which the Dorians despaired of success and withdrew. In the legend in which this series of events has come down to us the Dorians are represented as having entered the Peloponnesus under Temenus, Cresphontes, and Aristodemus, three descendants of Heracles, who had come to recover the territory of which their ancestors had been unjustly deprived by Eurystheus. Hence the name of the Return of the Heracleids, sometimes given to this event.

The Achæan inhabitants of the Peloponnesus whom the Dorians found there had a threefold fate. One part of them sought for new homes, and turned their steps toward the part of the Peloponnesus occupied by the Ionians, whom they expelled, keeping for themselves their territory, which hence received the name of Achaia. Another part voluntarily submitted to the invaders, who imposed tribute upon them and excluded them from all share in the government; while a third part resisted to the last, and were in the end reduced to the condition of slavery. In Laconia the former received the name Periœci (dwellers round), and the latter were called Helots.

The Ionians who were driven out of the Peloponnesus found at first a refuge among their kindred in Attica, but when this district did not suffice for all the inhabitants, old and new, large numbers of them left it and founded

Ionic colonies on several of the islands of the Ægean Sea and on the middle part of the coast of Asia Minor, where they built 12 cities, which formed an Ionic Confederacy. The principal of these were Ephesus and Miletus. About the same time as the Ionians are said to have colonized the middle part of the seaboard of Asia Minor, another body of Greeks, proceeding from Thessaly and Bœotia, are said to have founded the Æolian colonies on some of the northern islands of the Ægean, and on the northern part of the western coast of Asia Minor. The Æolic colonies of Asia Minor also formed a confederacy of 12 cities, but the number was afterward reduced to 11 by the accession of Smyrna to the Ionic Confederacy. While Ionians and Æolians thus colonized the middle and northern islands of the Ægean and coasts of Asia, the southern islands and the southern part of the west coast of Asia Minor were in like manner colonized by Dorian settlers. The six Doric towns in Asia Minor, along with the island of Rhodes, formed a confederacy similar to the Ionic and Æolic ones.

In considering the subject of Greek colonization we are brought face to face with the fact that in settling in foreign lands, the Greek races kept distinct from each other. One of the great keys to an understanding of Greek history is a right understanding of the relation between the two great races of the Greek name, the Dorians and Ionians. The Dorians were inland mountaineers, the Ionians were of the seacoast. The former, as represented in the institutions of Sparta, were a practical, and conservative race, living in public, simple and unimaginative. Their poetry was the public ode, accompanied with the dance in the market-place, often carried on under arms. The Ionians were versatile, imaginative, impressible. They were devoted to the maritime life, were travelers, and fond of welcoming strangers to their cities. They were traders. Moreover, they were keenly intellectual and reached the summit of excellence in art, literature, and philosophy. Their poetry was the epic narrative; and they invented the drama, in which the Ionian tale of personal adventure was united with the Doric ode. These two contrasted races between them swayed the fate of Greece. Their relations were complicated by the different colonies which they established at different points on the Mediterranean and Euxine coasts. In the course of time new Greek settlements were made on the coasts of the Hellespont, the Propontis (Sea of Marmora), and the Black Sea by both Dorians and Ionians. The most important of these were Byzantium (Constantinople) (Dorian), Sinope (Ionian), Cerasus (Ionian), and Trapezus (Trebizonde) (Ionian). Further, there were flourishing Greek colonies on the coasts of Thrace and Macedonia: for example, Abdera, Amphipolis, Olynthus, Potidæa, etc., which were all Ionian; and the Greek colonies in Lower Italy were so numerous that the inhabitants of the interior spoke Greek, and the whole region received the name of Greater Greece. The most famous of the Greek colonies in this quarter were Tarentum, Sybaris, Croton, Cumæ, and Naples. The island of Sicily also came to a great extent into the hands of the Greeks, who founded on it or enlarged many towns. By far the largest, most powerful, and most highly cultured of the Greek colonies was the Dorian colony of Syracuse, founded in the 8th century B.C. On the north coast of Africa the Dorian colony of Cyrene rivaled in wealth and commerce the city of Carthage; and on the south coast of Gaul Ionian Massilia (Marseilles) presented a model of civilized government to the inhabitants of the surrounding districts. All these towns kept up a commerce in the products of the land in which they were planted. They exerted a most important and beneficent influence on the manners of the neighboring inhabitants. They preserved the customs and institutions of their mother city, which they regarded with filial reverence; but otherwise they were perfectly free and independent.

Although ancient Greece never formed a single state, the various Greek tribes always looked upon themselves as one people, and classed all other nations under the general name of *Barbaroi* (foreigners). There were four chief bonds of union between the Greek tribes. First and chiefly they had a common language, which, though it had considerable dialectic peculiarities when spoken by different tribes, was yet understood throughout every part of Greece and in all the Greek colonies. Secondly, they had common religious ideas and institutions, and especially in the oracle of Delphi (q.v.) they had a common religious sanctuary, which was held by all the states in equal reverence, and was resorted to from all parts of Greece, alike by communities and individuals, for advice in circumstances of difficulty, and not unfrequently for indications as to the future. Thirdly, there was a general assembly of the Greeks called the Amphictyonic League (q.v.) in which the whole nation was represented by tribes (not by states), and the chief functions of which were to guard the interests of the sanctuary of Delphi, and to see that the wars between the separate states of Greece were not carried on in too merciless a manner. When any of the ordinances of the league were violated it was its duty to see that the violators were punished, and to entrust the infliction of the punishment to some one of its members. The fourth bond of union between the tribes of Greece consisted in the four great national festivals or games, the Olympian, Isthmian, Nemean, and Pythian (qq.v.) which were held at different intervals in four different parts of Greece, in which all Greeks, and none but Greeks, were allowed to participate, and which slaves were not allowed even to witness. At these games contests took place in foot-racing and chariot-racing, boxing, wrestling, and throwing with the quoit (or discus), and prizes were also awarded for works of art, poems, dramas, histories, etc. The prize was a simple wreath of olive or pine branches, or of parsley; but such a prize brought glory not only on the winner himself, but on his whole family and kindred, and even on the state to which he belonged. The victor was welcomed home by a triumphal procession, and his victory was celebrated in odes sung on the occasion, and sometimes composed by such poets as Simonides and Pindar. The Olympic games were the most celebrated of these festivals. They were held in the summer once every four years at Olympia, in Elis; the month in which they were held was considered as sacred, and during it no acts of hostility were allowed to take place between

any of the Greek states. Originally, the only contest was a foot-race, and so high was the honor of a victory in this race esteemed, that from that of Corœbus in 776 B.C. the whole of Greece reckoned the time. The year in which any event happened was styled the first, second, third, or fourth year of a certain Olympiad, the name given to the interval elapsing between each celebration.

The various small states of Greece may be divided, according to the form of their constitution, into the two great classes of aristocratic and democratic. Sparta or Lacedæmon, the chief town of Laconia and of the Dorians, was the leading aristocratic state; and Athens, the capital of Attica and the chief town of the Ionians, was the leading democratic state; and as a rule all the Doric states, and subsequently all those under the influence of Sparta, resembled that city in their constitution; and all the Ionic states, and those under the influence of Athens, resembled it. These two races are the only ones that come into prominence during the earlier part of Greek history subsequent to the Doric migration. Sparta is said to have derived its form of government, and all its institutions, near the close of the 9th **century** B.C., from Lycurgus, who made minute regulations as to the course of education and the mode of life among the Spartans. He had but one object, that of training the Spartan youth for war, and developing a hardy and warlike spirit among the people. The immediate results of this training were seen in the conquests which the Spartans effected over the surrounding states, especially over the Messenians in the 8th and 7th centuries B.C. Many of the vanquished Messenians left their native country and founded the city of Messana in Sicily. Those who remained were reduced to the condition of Helots (q.v.).

The constitution of Athens was not originally democratical, but monarchical. Afterward it became aristocratic, and first received a more or less democratic constitution from Solon at the beginning of the 6th century B.C. This was followed about 50 years later by a despotic monarchy under the celebrated "tyrant" Pisistratus, and his sons, Hippias and Hipparchus, the last survivor of whom, Hippias, reigned in Athens till 510 B.C. Hipparchus had been assassinated four years before; and the last four years of the reign of Hippias were distinguished by violence and cruelty. His enemies drove him from Athens, after which the republic was restored in a more purely democratic form than at first.

Hippias found refuge at the court of the king of Persia, with whose aid he hoped to be able to return and rule once more in Athens. The Persian monarchy had been established about 30 or 40 years before by Cyrus the Great, and its sway extended not only over the whole of Persia, Media, and Babylonia, but also over Egypt and Asia Minor. With the rest of this last-mentioned territory the Greek colonies on the coast had been brought under the yoke of this empire, and although they chafed under the foreign dominion, they were kept in subjection by the native princes or tyrants whom the Persian monarch imposed on them as governors. One of the most powerful of these governors was Histiæus of Miletus, whose behavior had excited the distrust of Darius, the Persian king, for the latter, on the pretence of rewarding him for a signal service invited him to his court and kept him at Susa in practical captivity. Histiæus secretly incited his relative, Aristagoras of Miletus, to get up a rising among the Greek colonies of Asia Minor, in the hope that he might, during the disturbance, find an opportunity of returning to his home. The endeavors of Aristagoras were successful; all the Greek towns on the coast were soon in arms, and assistance was asked from the mother country. Only Athens, which feared lest Darius should re-establish Histiæus, and the small Ionian town of Eretria in Eubœa, furnished any aid. The Greeks, in 496 B.C., conquered and burned the town of Sardis, the capital of Asia Minor, whereupon the rebellion extended over the whole of Ionia. But the superior forces of the enemy, and the want of union among the insurgents, led in the following year (495) to the loss of a naval battle, and soon after to the destruction of Miletus, the inhabitants of which were partly put to death and partly made captives.

Darius now determined to avenge himself on the Athenians and Eretrians for the part that they had taken in the rising. In 492 he sent out an expedition against them under his son-in-law Mardonius, but the Persian fleet was wrecked off the promontory of Mount Athos. Darius had at the same time despatched heralds to the islands and states of Greece to demand earth and water in token of submission. Most of the islands and many of the smaller states yielded, but Athens and Sparta indignantly refused the demand, and even went the length of putting the heralds to death. Enraged at this insult Darius equipped a second fleet and placed it under the command of Datis and Artaphernes. But this met with no better fate than the first. The Persians landed on the island of Eubœa, and after destroying Eretria, crossed the Euripus into Attica; but here they were met (490 B.C.) on the plain of Marathon by 10,000 Athenians and 1,000 Platæans, under Miltiades, and, although 10 times as numerous, were totally defeated and pursued to their ships. This battle put an end to the second Persian expedition, but Darius at once began to make preparations for a third expedition, and this time on a far greater scale than before. In the midst of these preparations he died, but his son Xerxes, collected an army of 1,700,000 men and a fleet of 1,200 large ships besides a number of smaller ones, crossed the Hellespont in 481 by means of two bridges of boats, and led his army through Thrace, Macedonia, and Thessaly, while his fleet followed the line of coast. Thessaly had surrendered without a stroke, and Xerxes at once pursued his march in the direction of Phocis. But before he could enter this territory he had to make his way through the narrow and difficult pass of Thermopylæ, and this had previously been occupied by 300 Spartans under Leonidas, along with several thousand allies. Here Xerxes in vain attempted to force a passage against a mere handful of Greeks; thousands of his troops were slain; and it was only after Ephialtes had betrayed to the Persians a foot-path which led over the heights of Œta to the rear of the defenders of the pass, that the Persian king effected his purpose. Leonidas allowed all the allies to depart, while he himself and his 300 Spartans,

along with 700 Thespians who voluntarily remained with them, held out until they were completely annihilated (480 B.C.).

The way through Phocis and Bœotia was now open to the Persians, who advanced into Attica, and laid the city of Athens in ruins, putting to death the small garrison. The women and children belonging to Athens had by this time, on the advice of Themistocles, been removed to Salamis, Ægina, and Trœzen, while all the men capable of bearing arms served in the fleet. It was to Themistocles that the deliverance of Greece was now chiefly due. The united fleet of the Greeks had already contended with success against that of the Persians off the promontory of Artemisium, in Eubœa, and had then sailed into the Saronic Gulf, whither it was followed by the enemy. In this confined arm of the sea, where there was no room for the manœuvring of the numerous ships of the enemy, a decisive battle between the two fleets took place with the result that Themistocles had anticipated, the total defeat of the Persians. This battle is known as the battle of Salamis, from the name of an island in the Saronic Gulf, and was fought in the same year as Thermopylæ (480 B.C.). Xerxes himself had been an eyewitness of the battle and at once began a speedy retreat with his land army through Thessaly, Macedonia, and Thrace, a retreat which Themistocles had hastened by causing the false report to reach Xerxes, that it was the intention of the Greeks to destroy the bridges of boats over the Hellespont. Xerxes left behind him only 300,000 men in Thessaly. In the spring of the following year (479) these advanced into Attica and compelled the citizens once more to seek refuge in Salamis; but in the battle of Platæa the Greeks, under the command of Pausanias, obtained so complete a victory, that only 40,000 of the Persians reached the Hellespont. On the same day the remnant of the Persian fleet was attacked and defeated by the Greeks off Mount Mycale, near Samos on the Ionian coast of Asia.

By the brilliant part which the Athenians under Themistocles had played against the Persians, the influence of Athens had greatly increased throughout Greece; and this was further strengthened by the fact that the war aginst Persia, which still continued, was chiefly conducted by sea, where Athens was much more powerful than Sparta. From this date then begins the period of the leadership or *hegemony* of Athens in Greece, which continued to the close of the Peloponnesian war, 404 B.C. Athens now exerted her influence to form a confederacy including the Greek islands and maritime towns as well as Athens herself, the object of which was to provide for the continuance of the war by the payment into a common treasury at Delos, of a fixed sum of money, and by furnishing ships for the same purpose. In this confederacy Athens of course had the lead, and gradually was able to render tributary many of the islands and smaller maritime states. In 469 B.C. the victories won by the Athenians over the Persians was crowned by the double victory of Cimon, the son of Miltiades, over the fleet and army of the Persians on the river Eurymedon, in the south of Asia Minor; and this victory was followed by the Peace of Cimon, which secured the freedom and independence of all Greek towns and islands. Shortly after followed the brilliant administration of Pericles, during which Athens reached the height of her political grandeur, while at the same time she flourished in trade, in arts, in science, and in literature.

The position of Athens, however, soon raised up a number of enemies. Sparta regarded her prosperity with jealousy; and the arrogance of Athens had produced a pretty general feeling of indignation and hatred. Two hostile confederacies were formed in Greece. At the head of one of these confederacies was the city of Athens, which was joined by all the Ionian states of Greece, and more or less supported by the democratic party in every state. At the head of the other confederacy stood Sparta, which was similarly joined by all the Dorian states, and supported by the aristocratic party everywhere. At last in 431 war was declared by Sparta on the complaint of Corinth that Athens had furnished assistance to the island of Corcyra in its war against the mother city; and on that of Megara, that the Megarean ships and merchandise were excluded from all the ports and markets of Attica.

In the first part of the Peloponnesian war the Spartans had considerable successes, while a great calamity befell the Athenians, who had collected all the inhabitants of the country districts of Attica within the walls of the city; and in consequence a pestilence broke out which carried off thousands of the inhabitants, and among them Pericles himself. From this blow, however, the city soon recovered, and in 425 the early successes of the Spartans in Attica were compensated by the capture of Pylos in Messenia by the Athenian general Demosthenes, who at the same time succeeded in shutting up 400 Spartans in the small island of Sphacteria, opposite Pylos, where they were ultimately starved into surrender. The person to whom the surrender was made was the demagogue Cleon, who, in consequence of his military successes, obtained the command of an army which was sent to operate against the Spartan general Brasidas in Thrace. But in 422 he was defeated by Brasidas before the town of Amphipolis, and himself slain, after which the opposite party in Athens got the upper hand, and concluded the peace with Sparta known as the Peace of Nicias (421 B.C.).

The effect of this peace was to divide the Spartans and the Corinthians, who had hitherto been allies. The latter united themselves with Argos, Elis and some of the Arcadian towns to wrest from Sparta the hegemony of the Peloponnesus. In this design they were supported by Alcibiades, a nephew of Pericles, a man of handsome figure and great personal accomplishments. The war which was now waged between Sparta and Corinth with her allies resulted, however, in favor of the former, whose arms were victorious at the battle of Mantinea in 418.

Soon after this the Athenians resumed hostilities, fitting out in 415 B.C. a magnificent army and fleet, under the command of Alcibiades, Nicias, and Lamachus, for the reduction of the Dorian city of Syracuse in Sicily. This undertaking, which renewed the race hatred between Sparta and Athens, was a complete failure. Alcibiades was accused in his absence of several offenses against religion and the constitution, and deprived of his command. Thirsting for revenge, he betook himself to Sparta, and ex-

horted the city to renew the war with Athens. By his advice one Spartan army was despatched to Attica, where it took up such a position as prevented the Athenians from obtaining supplies from Eubœa, while another was sent under Gylippus to assist their kindred in Sicily. These steps were ruinous to Athens. Lamachus fell in the siege of Syracuse, and the Athenian fleet was totally destroyed. The reinforcements sent out under Nicias and Demosthenes were defeated (413 B.C.) by the combined Spartan and Syracusan armies. All the Athenians who escaped death were made captives and compelled to work as slaves in the quarries of Sicily, although it may be mentioned as an interesting fact that many of these captives obtained their liberty by being able to recite fragments of Euripides.

After this disaster many of the allies of Athens joined the Spartans, who now pressed on the war with greater energy. The Athenians recalled Alcibiades, who returned in 407, and was received by his fellow-citizens with enthusiasm as their expected deliverer. A few months later he was again an exile, having been deprived of the command because one of his subordinates had lost a naval battle fought off Ephesus in his absence. During the rest of the war the Athenians had only one success, the naval victory won off the islands of Arginusæ over the Spartan Callicratidas in 406. In the following year (405) the Spartans made themselves masters of the whole of the Athenian fleet except nine vessels, while the majority of the crews were on shore at Ægospotamos on the Hellespont. The Spartans now easily subdued the islands and states that still maintained their allegiance to the Athenians, and laid siege to Athens itself. In 404 B.C. the war was terminated by the Athenians' surrender. Sparta immediately imposed upon Athens an aristocratic form of government, placing the supreme power in the hands of the Thirty Tyrants. Only a year later, however (403), Thrasybulus was able to overthrow this hated rule and re-establish the democracy.

The fall of Athens resulted in Sparta's leadership or hegemony in Greece, which lasted till the battle of Leuctra, 371 B.C. The Spartans now abused their power and speedily roused the hatred and jealousy of the other states. The Greek states which had up to this time been, and still continued to be, leaders, had now lost almost entirely their manliness and independent spirit, and no longer maintained the hereditary war against Persia, but each sought the aid of that power for its own purpose. The Spartans did indeed send an expedition into Asia Minor, but it came to nothing; and the states of Greece, the Spartans included, at last, in 387, agreed to the disgraceful Peace of Antalcidas, by which the whole of the west coast of Asia Minor was ceded to the Persians, and the Greek colonies there thus deprived of the independence that had been secured to them by the Peace of Cimon.

An act of violence committed by a Spartan general in Thebes in 380 in the end led to the complete downfall of that city. The aristocratic party in Thebes, when the Spartan army happened to be in the neighborhood, prevailed upon the general to give his assistance in overthrowing their opponents and establishing an aristocratic government. A number of the less prominent members of the defeated party, among them Pelopidas, made their escape to Athens, where they got the support and assistance of the democratic party there. They soon returned in disguise to their own city, surprised and murdered the leaders of the aristocratic party, expelled the Spartan garrison, and again set up a democratic government. These circumstances give a good idea of the fury of party strife which was then general in the Greek cities. The immediate result of this counter-revolution in Thebes was a war with Sparta, the heroes of which were Epaminondas and Pelopidas, who were then at the head of affairs in Thebes. In the course of the war the Spartans invaded Bœotia, but were so completely defeated at Leuctra in 371 B.C. that they never fully recovered from the blow.

With this victory Thebes won hegemony in Greece, which she maintained during the lifetime of Epaminondas, whose policy it was to keep down the power of Sparta by strengthening the surrounding states. From him the Messenians recovered their freedom, and by his advice the cities of Arcadia formed themselves into a confederacy, and built the city of Megalopolis. This policy was at first successful, but in a few years the confederacy began itself to strive after the supremacy, and joined themselves with this object to the Spartans. Epaminondas then invaded the Peloponnesus, but although the Thebans totally defeated the Spartans and Arcadians in the battle of Mantinea (362), yet the victory being won with the loss of their great general, the Thebans could no longer boast with justice of supremacy in Greece. Pelopidas had died two years before.

Two years after the death of Epaminondas, Philip, the father of Alexander the Great, became king of Macedonia. He was a man of great ability as a soldier and a ruler, an admirer of the Greek character, and a lover of Greek art and literature. He perceived, however, the weakness of the Greeks, arising from their want of unity, and waited for an opportunity of interfering in the affairs of their country, with the view of ultimately making himself master of it. An occasion for interference was furnished him by the Sacred war (355–46). The Phocians having taken possession of some of the land belonging to the sanctuary of Delphi, the Amphictyonic League condemned them to pay a fine and restore the land they had taken. This was refused and the league imposed upon the Thebans the task of forcing the Phocians to submit, but in their rocky strongholds the Phocians were able to resist all the efforts of their assailants, who at last called in the aid of Philip of Macedon. With his help the Phocians were subdued, they themselves expelled from the league, and their place given to Philip.

It was not, however, till the Locrian war (339–8) that Philip acquired a firm hold in Greece. The Locrians had committed the same offense as that of the Phocians, and when they likewise refused to pay the fine imposed upon them by the league, Philip, as one of the members, received the charge of punishing them. The advance of Philip was at first witnessed with comparative indifference by the states of Greece, but when his real designs became apparent the Athenians, on the advice of Demosthenes, hastily concluded an alliance with the Thebans, and an army was sent out to oppose

him. The battle of Chæronea (338) turned out, however, disastrously for the Greeks, who saw their whole country laid at the feet of Philip. But the conqueror treated his new subjects with mildness, wishing to reconcile them to the Macedonian yoke, and to win their co-operation in his projected invasion of the rotten empire of Persia. He collected a large army, of which he got himself declared commander-in-chief by the Amphictyonic League in an assembly held at Corinth in 337 B.C.; before he was able to start he was assassinated 336 B.C.

The design of Philip on Persia was taken up and carried out by his son Alexander the Great, during whose absence Antipater was left behind as governor of Macedonia and Greece. Soon after the departure of Alexander, Agis III. of Sparta headed a rising against Antipater. He was defeated, however, in the battle of Megalopolis in 330 B.C., and no other attempt was made by the Greeks to recover their liberty for nearly 100 years. At the close of the wars which followed the death of Alexander, and which resulted in the division of his empire, Greece remained with Macedonia.

The last efforts of the Greeks to recover their independence proceeded from the Achæans, who held the northern strip of the Peloponnesus. This tribe is frequently mentioned by Homer as taking a very prominent part in the Trojan war; but during the historical period of Greece they for the most part kept aloof from the quarrels of the other states, and did not even furnish assistance in repelling the Persian invasion. They had taken part, though reluctantly, in the Peloponnesian war on the side of Sparta, and had shared in the defeat of Megalopolis in 330 B.C. In the course of the first half of the 3d century B.C. several of the Achæan towns expelled the Macedonians, and revived an ancient confederacy, which was now known as the Achæan League. About the middle of this century the league was joined by the town of Sicyon, the native city of Aratus, who soon after became its leading spirit. Through his influence it was joined also by Corinth, and then it began to aim at acquiring the supremacy throughout the Peloponnesus, and even throughout the whole of Greece, as well as at delivering Greece from the Macedonian yoke. In following out the first of these aims Aratus and the league came into collision with Sparta, which at that time happened to be governed in near succession by two kings, Agis IV. (244–240) and Cleomenes (236–220), who had both something of the old Lycurgan spirit in them. These, then, naturally looked with jealousy on the efforts of Aratus, and during the reign of Cleomenes a war broke out between Sparta and the Achæan League. The league was at first worsted, and was only finally successful when Aratus, forgetting the ultimate end of his efforts in the pursuit of that which he had more immediately in view, called in the aid of the Macedonians. In the battle of Sellasia, in 222 B.C., Cleomenes was defeated and compelled to take to flight, and the Macedonians became masters of Sparta. Aratus died in 213, and his place was taken by Philopœmen, "the last of the Greeks," who roused the league once more to vigorous efforts, and gradually succeeded in making it in some degree independent of Macedonia.

About this time the Romans, who had just come out victorious from a second war with Carthage, in which they had had to contend with Hannibal, found an occasion to interfere in the affairs of Greece. Philip V. of Macedon had allied himself during this war with Hannibal, and, accordingly as soon as the war was concluded, the Romans sent over Flamininus to punish him for so doing, and in this war with Philip the Romans were joined by the Achæan League. Philip was defeated at the battle of Cynoscephalæ in 197 B.C., and was in consequence obliged to agree to a peace, in which he recognized the independence of Greece. To gratify the Greek vanity Flamininus proclaimed the deliverance of Greece from the Macedonian yoke at a celebration of the Isthmian games in 196 B.C.; but the Greeks soon felt that they had only exchanged masters, that they were in reality, although not in name, as much in subjection to them as they had ever been to the Macedonians. On this account the Ætolians, who had formed a league similar to that of the Achæans, appealed for assistance against the Romans to Antiochus the Great, king of Syria, one of the kingdoms which had been formed out of the empire of Alexander. The appeal was listened to; but the help afforded was useless, for Antiochus was defeated in a bloody battle at Magnesia in Asia Minor in 190 B.C. The Ætolians were compelled to pay a money indemnity, and to sacrifice some of their art treasures.

By this time the Achæan League was unquestionably supreme over all other powers within Greece, having been joined by all the states of the Peloponnesus. But the league itself was in reality subject to Rome, the senate of which assumed the right of regulating its proceedings; and on one occasion, in 168 B.C., on the conclusion of a war waged by the Romans against Macedonia, the former carried off into Italy 1,000 of the noblest Achæans, on the pretext that they had furnished assistance to the Macedonians. Such was the condition of affairs until 147 B.C., when the league openly resisted a demand made by the Roman senate, that Sparta, Corinth, Argos, and other cities, should be separated from it, in consequence of which a war ensued, which was concluded in 146 B.C. by the capture of Corinth by the rude consul Mummius.

The independence of Greece was virtually gone with the fall of Corinth. From this date the prosperity of her cities rapidly declined, and the last sparks of the ancient Greek patriotism and love of independence became extinguished. The various cities still retained, however, something of the qualities for which they had been remarkable at the height of their glory. Athens was still one of the centres of culture, and the cradle of all kinds of new speculations. Many Athenians left their native city and made a livelihood, although they gained little esteem, among the Romans, as artists and scholars, actors and dancers, poets and wits. The citizens of Sparta continued to gratify their thirst for warfare as well as their covetousness by serving as mercenaries in foreign armies. Corinth was still the home of luxury and vice.

From the date above mentioned Greece remained attached to the Roman empire. On the division of the Roman empire it fell of course to the eastern or Byzantine half. From 1204 to 1261 it formed a part of the Latin Empire of the East, and was divided into a number of feudal principalities. In the latter year it was reannexed to the Byzantine empire, with which

it remained till it was conquered by the Turks between 1460 and 1473. In 1699 the Morea was ceded to the Venetians, but was recovered by the Turks in 1715. (For the history of the present kingdom of Greece, see GREECE, MODERN.) Consult: Thirlwall, 'History of Greece'; Grote, 'History of Greece'; Bury, History of Greece' (1900).

Cosmogony and Religion.— Nowhere did polytheism develop itself into a brighter and more beautiful system than among the ancient Greeks. It was this circumstance no doubt that led the Romans, when they became acquainted with the literature and religion of the Greeks, to blend the Greek system with that of the ancient Italians, identifying the Greek deities with those of their own pantheon. In this way the Greek and Italian deities came to be confounded.

According to the view of the origin of all things which in course of time grew up among the Greeks, the universe was in the beginning a formless mass, Chaos (confusion), from which arose the "broad-bosomed" Earth (Greek, *Gaia, Gē;* Latin, *Tellus*), the Lower World (Tartarus), the darkness of Night (Greek, *Nux;* Latin, *Nox*), the parent of Light, and the formative principle of Love (Greek, *Erōs;* Latin, *Amor*), all of which were regarded as independent divinities. From the womb of the Earth proceeded the Heaven (Greek *Ouranos;* Latin, *Cœlum*) and the Ocean, and afterward the Titans, creatures of superhuman size and strength, who formed the first dynasty of gods. The Titans were succeeded by a more genial race of divinities endowed with intellectual as well as physical qualities, who subdued the Titans, and subsequently the Giants, another race whom the Earth produced after the loss of her first brood. In this second dynasty of gods the supreme ruler was Zeus (Jupiter or Juppiter), the son of Kronos (Saturn), who after the subjugation of the Titans and Giants ruled in Olympus over "the middle air," while his brother Pluto reigned over the dark kingdom of the lower world (Hades, Tartarus, Orcus), and Poseidōn (Neptune), armed with his trident, ruled in the sea. Like reverence was paid to Hēra (Juno), the sister and wife of Zeus, and the queen of Heaven, the virgin Pallas Athēnē (Minerva), a goddess armed with helmet and shield, and worshipped as the patroness of all intellectual employments and useful inventions, to the two children of Lētō (Latona), Apollo, the leader of the Muses (hence called Musagētēs) and the protector of the fine arts, and his sister, the chaste huntress Artemis (Diana), the goddess of the moon, to the daughter of Zeus, Aphroditē (Venus), the goddess of love, Ares (Mars), the god of war, Hermēs (Mercury), the herald of the gods, and others besides. In addition to these there was an innumerable host of inferior deities (Nymphs, Nereids, Tritons, Horai, Sirens, Dryads and Hamadryads, etc.), who presided over woods and mountains, fields and meadows, rivers and lakes, the seasons, etc. There was also a race of heroes or demigods (Heracles or Hercules, Perseus, etc.) tracing their origin from Zeus, and forming a connecting link between gods and men, while on the other hand the Satyrs formed a connecting link between the race of men and the lower animals. According to a plausible theory, now less generally held than formerly, these gods and demigods are nothing else than the personified objects of nature (the Sky or Upper Air, the Sun, the Ocean, the Air in Motion, etc.), and were originally not conceived as personified, in the strict sense of the term, that is, as clothed in a human form, but simply as the objects themselves, to which the earliest races everywhere attributed a conscious existence like their own, and that the mythological tales relating to these deities and heroes were in their simplest form the natural expression of what human beings in their infancy believed to be done and felt by the very things which they saw. Such is the theory of Max Müller, Mr. Cox, and others; but it will be more appropriately expounded in the article Mythology (q.v.).

With regard to the inculcation of religious beliefs, and the practice of religious duties among the Greeks, the most striking thing to remember is that they had no separate class appointed to perform these functions. The priests were in no sense preachers of doctrines, but merely hierophants, or exhibitors of sacred things, of rites, symbols, and images. They showed how the gods were to be worshipped, or more usually how a particular god was to be worshipped; but it was not their office to teach theological doctrine.

Greek Language and Writing.— The language which we call Greek belongs, as is well known, to the Indo-European or Aryan family of tongues, being akin to the Sanskrit, Persian, Latin, Celtic, Slavonic, and Germanic languages, including of course English. Out of Greece it was spoken in a great part of Asia Minor, of the south of Italy and Sicily, and in other regions which were settled by Grecian colonies. From the great number of Hellenic tribes of the same race it was to be expected that there would be different dialects, the knowledge of which is the more necessary for becoming acquainted with the Greek language, since the writers of this nation have transmitted the peculiarities of the different dialects in the use of single letters, words, forms, terminations, and expressions, and that not merely to characterize more particularly an individual represented as speaking, but even when they speak in their own person. It is customary to distinguish three leading dialects, according to the three leading branches of the Greeks, the Æolic, the Doric, and the Ionic, to which was afterward added the mixed Attic dialect; besides these there are several secondary dialects. Akin to the Ionic is the so-called Epic dialect, that in which the poems of Homer and Hesiod are written, and which was afterward adopted by other epic writers. The Doric was rustic and harsh; the Ionic was the softest and most liquid. The Attic was the neatest, clearest and most precise in sound literation and idiom. The Æolic was spoken on the north of the Isthmus of Corinth (except in Megara, Attica, and Doris), in the Æolian colonies of Asia Minor, and on some of the northern islands of the Ægean Sea. The Doric was spoken in the Peloponnesus, in the Doric Tetrapolis, in the Doric colonies of Asia Minor, of Lower Italy (Tarentum), of Sicily (Syracuse, Agrigentum), and most purely by the Messenians; the Ionic in the Ionian colonies of Asia Minor, and on the islands of the Archipelago; and the Attic in Attica. In each of these dialects there are celebrated authors. The Ionic dialect is found pure

in some prose writers, especially Herodotus and Hippocrates. The Doric is used in the poems of Pindar, Theocritus, Bion, and Moschus. Little Doric prose remains, and that is mostly on mathematical or philosophical subjects. In Æolic we have fragments of Alcæus and Sappho. After Athens had obtained the supremacy of Greece, and rendered itself the centre of all literary cultivation, the masterpieces of Æschylus, Sophocles, Euripides, Aristophanes, Thucydides, Xenophon, Plato, Aristotle, Isocrates, Demosthenes, etc., made the Attic the common dialect of literature. Grammarians afterward distinguished the genuine Attic, as it exists in those masters from the Attic of common life, calling the latter the *common Greek* or *Hellenic* dialect; and even the later Attic writers, posterior to the golden age of the literature, were designated *Hellenes* or *common Greeks*. In this latter class are Theophrastus, Apollodorus, Polybius, Plutarch, and others. Many of the later writers, however, wrote genuine Attic, as Lucian, Ælian, and Arrian. Except the dramatists, the poets by no means confined themselves to the Attic; the dramatists themselves assumed the Doric, to a certain degree, in their choruses, for the sake of giving them additional solemnity, because the antique ode was of Doric tradition. They also used the epic or Æolic dialect in narrative passages of the drama where it recalled the recitations of the ancient Ionian rhapsode. Undoubtedly the Greek dialects were not, in the earliest times, so distinct from each other as they afterward became; and on this subject we may quote the words of Prof. Bury (Hist. of Greece, chap. i.): "There can be little doubt that the mixture of the Greeks with the native peoples had a decisive effect upon the differentiation of the Greek dialects. The dialects spoken by the first settlers in Thessaly, in Attica, in Arcadia, have some common characteristics which tempt us to mark them as a group, and distinguish them from another set of dialects spoken by Greek folks which were to appear somewhat later on the stage of history. We may conjecture that the first set of invaders spoke in their old home much the same idiom; that this was differently modified in Thessaly and Bœotia, in Attica and Argolis, and the various countries where they settled; and that many of the local peculiarities were developed in the mouths of the conquered learning the tongue of the conquerors." It results that to have a thorough knowledge of the Greek language we must follow out historically as far as possible the course of its formation, extending our view over all the varied forms of the dialects — a labor which this language, so rich in classic models of every kind, so perfect, so flexible, so expressive, so sweet in its sound, so harmonious in its movements, and so philosophical in its grammatical forms and whole structure, merits, and richly rewards.

When the Greeks became acquainted with the art of writing we do not know. In Egypt hieroglyphics were used more than 3,000 years before the Christian era, and the cuneiform writing of Assyria and Babylonia had a similar antiquity. In Crete writing was practised more than 2,000 years before Christ, it is believed, and among the Asiatic Greeks it was probably introduced 9 or 10 centuries before Christ. According to the writer above quoted: "Perhaps the earliest example of a Greek writing that we possess is on an Attic jar of the 7th century; it says the jar shall be the prize of the dancer who dances more gaily than all the others. But the lack of early inscriptions is what we should expect. The new art was used for ordinary and literary purposes long before it was employed for official records. It was the great gift, which the Semites, who themselves derived it from Egypt, gave to Europe." According to the legend it was Cadmus the Phœnician who introduced the alphabet into Greece; and it is an undoubted fact that the most of the Greek letters are derived from the Phœnician ones. The Greek alphabet possesses the following 24 letters: Α, α (alpha), a; Β β (beta), b; Γ, γ (gamma), g; Δ, δ (delta), d; Ε, ϵ (epsilon), ĕ; Ζ, ζ (zeta), z; Η, η (eta), ē; Θ, θ (theta), th; Ι, ι (iota), i; Κ, κ (kappa), k; Λ, λ (lambda), l; Μ, μ (mu), m; Ν, ν (nu), n; Ξ, ξ (xi), x; Ο, ο (omicron, i. e. small o), ŏ; Π, π (pi), p; Ρ, ρ (rho), r; Σ, σ, ς (sigma), s; Τ, τ (tau), t; Υ, υ (upsilon), u, commonly transliterated by y; Φ, φ (phi), ph; Χ, χ (chi), ch guttural; Ψ, ψ (psi), ps; Ω, ω (omega, or great *o*), *ō*. There are also marks indicating accent, a rough and a smooth "breathing," the former equivalent to *h* initial before a vowel; but no *j*, *v*, *w*, etc. The alphabet originally introduced into Greece is said to have consisted of but 16 letters; 4 (Θ Ξ Φ Χ) are said to have been invented by Palamedes during the Trojan war, and 4 more (Ζ Η Ω Ψ) by Simonides of Ceos. That the 8 letters mentioned are more modern than the others is certain, partly from historical accounts, partly from the most ancient inscriptions. It remains to remark that the Greeks originally wrote from right to left; then *boustrophedon*, that is, alternately from right to left and left to right; and finally always from left to right.

Greek Literature.— The origin of Greek literature, that is, of the intellectual cultivation of the Greeks as contained in written works, is lost in an almost impenetrable obscurity. Though there existed in Greece, in earlier times, no actual literature, there probably was by no means a want of what we may not improperly call *literary cultivation*, if we free ourselves from the prejudice that a literature must of necessity be embodied in written alphabetical characters. The *first period* of Grecian cultivation which extends to the movement known as the invasion of the Peloponnesus by the Heraclidæ and Dorians, and the great changes produced by it, and which we may designate by the name of the *Ante-Homeric period*, was no doubt utterly destitute of literature; but it may be questioned whether it was also destitute of all that culture which we are accustomed to call *literary*. The fables which are told of the intellectual achievements of this period may have a certain basis of truth. Among the promoters of literary cultivation in this time we must distinguish three classes: (1) Those of whom we have no writings, but who are mentioned as inventors of arts, poets, and sages: Amphion, Demodocus, Melampus, Olen, Phemius, and Prometheus. (2) Those to whom are falsely attributed works no longer extant: Abaris, Aristeas, Chiron, Epimenides, Eumolpus, Corinnus, Linus, and Palamedes. (3) Those to whom writings yet extant, which, however, were productions of later times, are attributed: Dares, Dictys, Horapollo, Musæus, Orpheus, and the authors of the

Sibylline oracles. This is not the place to inquire whether any and how much of these writings is genuine. It is enough that the idea of such a forgery proves a belief in the existence of earlier productions. And how could the next period have been what it was without previous preparation? If we may thus infer what must have been in order that the succeeding period should be what it was, we learn also from the various traditions of the Ante-Homeric period that there existed in it institutions which, through the means of religion, poetry, oracles, and mysteries, had no small influence on the civilization of the nation and the promotion of culture; for the most part, indeed, in Oriental forms, and perhaps of Oriental origin; and that these institutions, generally of a priestly character, obtained principally in the northern parts of Greece, Thrace, and Macedonia. We must here remark that intellectual cultivation did not prosper at once in Greece, nor display itself simultaneously among all the tribes; that the Greeks became Greeks only in the process of time, and some tribes made more rapid progress than others.

About 80 years after the Trojan war new commotions and a new migration began within the borders of Greece. A portion of the inhabitants emigrated from the mother country to the islands and to Asia Minor. This change was in the highest degree favorable to Grecian genius; for the new settlements, abounding in harbors, and destined by nature for commerce and industry, afforded them not only a more tranquil life, but also a wider field for refinement, and gave rise to new modes of life. The ancients ascribed to the colonies in Ionia and the rest of Asia Minor the character of luxury and voluptuousness. The blue sea, the pure sky, the balmy air, the beautiful prospects, the finest fruits, and most delicious vegetables in abundance, all the requisites of luxury, here united to nourish a soft sensuality. Poetry and philosophy, painting and statuary, here attained their highest perfection; but great and heroic deeds were oftener celebrated than performed. Near the scene of the first grand national enterprise of the Greeks — the Trojan war — it was not strange that the interest this event excited should be lively, and that it should take a powerful hold of the imagination. Poetry thus found a subject, in the treatment of which it necessarily assumed a character entirely distinct from that of the former period. Among all nations heroic poetry has flourished with the spirit of heroism. The heroes were here followed by the bards, and thus the epopee was formed. We therefore call this *second period* the *epic age* of the Greeks. The minstrel (*aoidos*) now appears separated from the priest, but highly honored, particularly because the memory of the heroes lived in his verse; and poetry was the guardian of all the knowledge of preceding times, so long as traditions were not committed to writing. From its very nature the epopee must be historical, in an enlarged sense. Under such circumstances it is not strange that regular schools for poets were established; for the imagination of the first poet fired the imagination of others, and it was then, perhaps, believed that poetry must be learned like other arts — a belief to which the schools for priests, on which the schools for minstrels were probably modeled, contributed not a little. But they were minstrels in the strictest sense, for their traditions were sung, and the poet accompanied his verses on a stringed instrument. On every important occasion minstrels were present, who were regarded as standing under the immediate influence of the gods, especially of the Muses, who were acquainted with the present, the past, and the future. The minstrel, with the seer, thus stood at the head of men. But among the many minstrels which this age undoubtedly possessed, Homer alone has survived, whose name has always been associated with the two great epic poems, the 'Iliad' and 'Odyssey,' although in modern times the theory first promulgated by Wolf in 1795, that neither of these poems is the work of one man, has been accepted either entirely or with modifications by many scholars, and many others who contend for the unity of each of the two poems are yet inclined to believe that they were not both composed by the same individual. The latter opinion is not of modern origin, but divided also the Homeric scholars of ancient times. Several hymns, and a mock heroic poem called the 'Batrachomyomachia,' or the 'Battle of the Frogs and Mice,' are also ascribed to Homer, but on altogether insufficient grounds. From him an Ionian school of minstrels takes its name — the *Homeridæ* — who probably constituted at first, at Chios, a distinct family of rhapsodists, and who preserved the old Homeric and epic style, the spirit and tone of the Homeric verse. Much that was attributed to Homer may reasonably be assigned to them. A certain class of the followers of Homer are known by the name of the Cyclic poets, who began, however, to deviate materially from the Ionian epos, the historical element predominating more and more over the poetical. By Cyclus we understand the whole circle of traditions and fables, and not merely the events of the Trojan war. Cyclic poetry comprehended the whole compass of mythology; and we may, therefore, divide it into: (1) a cosmogonical; (2) a genealogical; and (3) a heroic Cyclus; in the latter of which there are two separate periods: (1) that of the heroes before; and (2) that of those after, the expedition of the Argonauts. To the first class belong the battles of the Titans and giants; to the second, the theogonies and herogonies. To the first period of the third class belong the Europia, several Heracleia and Dionysiacs, several Thebaids, Argonautics, Theseids, Danaids, Amazonica, etc. In the second period the poetry generally related to the Trojan war. To this belonged the Nostoi, which treated of the return of the heroes from Troy. The earliest of these Cyclic poets appeared about the time of the first Olympiad. A history of the gradual formation of their poetry cannot be given, because we have only very general accounts respecting them. But what we do know justifies us in concluding that between these historic poets and the Ionian school of minstrelsy something intervened, making, as it were, the transition. And we actually find this in the *Bœotian-Ascrean* school, which arose in European Greece, it is said, in the 8th century B.C. It derived its name from Ascra in Bœotia, the residence of Hesiod, who stood at its head, and by whom poetry was probably conducted back again from Asia Minor (for he was originally of Cyme in Æolia) to Greece. His

works also were at first preserved by rhapsodists. They were not arranged till a later period, when they were augmented by foreign additions; so that, in their present form, their authenticity is as doubtful as that of the poems ascribed to Homer. Of the 16 works attributed to him there have come down to us the 'Theogony,' the 'Shield of Hercules' (the fragment of a larger poem), and 'Works and Days' (a didactic work on agriculture), the 'Choice of Days,' intermixed with moral and prudential maxims, etc. The works of Homer and Hesiod acquired a canonical importance among the Greeks, and constituted, in a certain degree, the foundation of youthful education.

In the *third period*, the age of lyric poetry, of apologues and philosophy, our knowledge of Greek history gradually acquires a greater certainty. About the beginning of the epoch of the Olympiads (776 B.C.) there ensued a true ebb and flood of constitutions among the small states of Greece. After numerous vicissitudes of power, during which the contending parties persecuted each other for a long time with mutual hatred, republics, with democratical constitutions, finally sprang up, which were in some measure united into one whole by national meetings at the sacred games. The spirit prevalent in such a time greatly favored lyric poetry, which now became an art in Greece, and reached the summit of its perfection at the time of the invasion of the Persians. Next to the gods, who were celebrated at their festivals with hymns, their country, with its heroes, was the leading subject of this branch of poetry, on the character of which external circumstances seem to have exercised no slight influence. The mental energies of the nation were roused by the circumstances of the country; and the numerous wars and conflicts, patriotism, the love of freedom, and the hatred of enemies and tyrants, gave birth to the heroic ode. Life, however, was at the same time viewed more on its dark side. Thence there was an intermingling of more sensibility in the elegy, as well as, on the other side, a vigorous reaction, in which the spirit of ridicule gave rise to the iambus (satire). In everything there was a more powerful impulse toward meditation, investigation, and labor for the attainment of a desired condition. The Golden Age, the gift of the gods, was felt to have departed. Whatever man discovered in future was to be the fruit of his own efforts. This feeling showed that the age of manhood had arrived. Philosophy had become necessary, and attained continually a greater development. It first spoke in maxims and gnomes, in fables and in dogmatic precepts. Lyric poetry next gave utterance to the feelings excited by the pleasures of earth. Of those who gained a reputation in this way, as well as by the improvement of music and the invention of various forms of lyric poetry, history presents us the names of Archilochus of Paros, inventor of the iambus; Tyrtæus, author of war songs; Callinus of Ephesus, inventor of the elegiac measure (all of whom flourished in the 7th century B.C.); Terpander of Antissa, in Lesbos (675 B.C.); Simonides of Amorgos (664), the second of the three principal iambic poets of Greece; Alcman the Lydian, and Arion of Methymna, said by Herodotus to have invented the dithyrambus (both flourished about 630 B.C.); Sappho, Alcæus, and Erinna, all natives of Lesbos, the first two of Mitylene, and all of whom flourished about 610 B.C.; Mimnermus of Colophon (flourished from about 634 to 600 B.C.); Stesichorus of Himera (600); Ibycus of Rhegium (lived about 540 B.C. at the court of Polycrates of Samos); Anacreon of Teos (lived first at the court of Polycrates, afterward at that of Hipparchus at Athens); Hipponax of Ephesus (540–520), the third great iambic poet; Lasus of Hermione (520); Simonides of Ceos (fl. 500); his contemporary, Timocreon of Rhodes; Corinna of Tanagra (490), the friend and instructress of Pindar (522–442). As gnomic writers, Theognis of Megara and Phocylides of Miletus deserve to be named (both of whom flourished about 540 B.C.); as a fablist, Æsop (570 B.C.). In the order of time several belong to the following period, but are properly placed here, on account of their connection.

In the period of 550–500 B.C. traditions were first committed to writing in prose, and Cadmus of Miletus (540), Acusilaus the Argive, Hecatæus of Miletus (500), Hellanicus of Mitylene, and Pherceydes of Scyros, are among the oldest historical writers (450). These are known as the logographers (*logographoi*), a name given to them by Thucydides. After them appeared Herodotus (born 484), the Homer of history. His example kindled Thucydides (born 471) to emulation, and his eight books of the history of the Peloponnesian war make him the first philosophical historian, and a model for all his successors. If his conciseness sometimes renders Thucydides obscure, in Xenophon (born about 444), on the contrary, there prevails the greatest perspicuity; and he became the model of quiet, unostentatious historical writing. These three historians are the most distinguished of this period, in which we must, moreover, mention Ctesias (400), Philistus (363), and Theopompus (340).

An entirely new species of poetry was created in this period. From the thanksgiving festivals, which the country people solemnized after the vintage, in honor of Dionysus (Bacchus), with wild songs and comic dances, arose, especially in Attica, the drama. By degrees variety and a degree of art were given to the songs of the village chorus, and by and by an intermediate speaker was introduced, who related popular fables, while the chorus varied the eternal praises of Bacchus by moral reflections, as the narration prompted. These games of the feast of the vintage were soon repeated on other days. Solon's contemporary, Thespis, who smeared his actors, like vintagers, with lees of wine, exhibited at the cross ways or in the villages, on movable stages, stories sometimes serious with solemn choruses, sometimes laughable with dances, in which satyrs and other ridiculous characters excited laughter. Their representations were called tragedies (*tragōdiai*), that is, songs of the goat (so called either because the exhibition of a tragedy was in the earliest times accompanied by the sacrifice of a goat, or because a goat was the prize, or because the actors were clad in goat-skins) comedies (*kōmōdiai*, meaning either village songs, from *kōmē*, a village, or songs of revelry, from *kōmos*, revelry), festive dances and satirical actions (*drama satyricum*). These sports were finally exhibited, with much more splendor, on the stages of the towns, and acquired a more and more distinct character by their peculiar tone

and morality. Instead of an intermediate speaker, who related his story extemporaneously, Æschylus (525–456) first substituted actors, who repeated their parts by rote; and he was thus the actual creator of the dramatic art, which was soon carried to perfection; tragedy by Æschylus, Sophocles (495–406) and Euripides (480–406); comedy by Cratinus (519–422), Eupolis (fl. 449), Crates, but especially by Aristophanes (about 444–380). Under the government of the Thirty Tyrants the freedom which comedy had possessed, of holding up living characters to ridicule, was restricted, and the middle comedy was thus gradually formed, in which the chorus was abolished, and, with delineations of general character, characteristic masks were also introduced. The mimes of Sophron of Syracuse (460–420), dramatic dialogues in rhythmical prose, formed a distinct species, in connection with which stands the Sicilian comedy of Epicharmus (about 540–450).

Eloquence, the necessary outcome of the democratic institutions of many of the Greek states, likewise flourished during this period, and was speedily elevated to the rank of a fine art. Antiphon (440), Lysias (458–378), Isocrates (436–338), Isæus (420–348), Demosthenes (about 385–322), Æschines (389–314), were renowned masters of this art. We still possess the admired masterpieces of several of these orators. How near rhetoric was then to triumphing over poetry is manifested in Euripides, and there is no question that it had a considerable influence on Plato and Thucydides. Mathematics was now cultivated, and geography served to illustrate history. Astronomy is indebted to the Ionic school, arithmetic to the Italic, and geometry to the Academic school for many discoveries. As mathematicians, Meton, Euctemon, Archytas of Tarentum, Eudoxus of Cnidus, were celebrated. Geography was particularly enriched by voyages of discovery, which were occasioned by commerce; and in this view Hanno's voyage to the western coast of Africa, the Periplus of Scylax (a description of the coasts of the Mediterranean), and the discoveries of Pytheas of Massilia in the northwest of Europe, deserve mention. The study of nature was likewise pursued by the philosophers; but the healing art, hitherto practised by the Asclepiadæ in the temples, constituted a distinct science, and Hippocrates (about 460–357) became the creator of scientific medicine.

The following period is usually called the *Alexandrine,* and might be characterized as the *systematizing* or *critical period.* Athens did not, indeed, cease to sustain its ancient reputation; but during the greater part of the period Alexandria was in reality the leading Greek city. From this and other causes the spirit of Grecian literature necessarily took another turn. Greece was now under a foreign yoke; great creative geniuses no longer arose either in the home country or in the colonies; and the use of an immense library tended to make erudition triumph over the free action of mind, which, however, could not be immediately overborne. In philosophy, Plato's acute and learned disciple, Aristotle (384–322), appeared as the founder of the Peripatetic school, which gained distinction by enlarging the territory of philosophy, and by its spirit of system. He separated logic and rhetoric, ethics and politics, physics and metaphysics, and applied philosophy to several branches of knowledge; thereby producing economics, pedagogics, and poetics. He invented the philosophical syllogism, and gave philosophy the form which it preserved for centuries. His disciple Theophrastus (died 287 B.C.) followed his steps in the investigation of philosophy and natural history. But the more dogmatic was the philosophy of Aristotle, the more caution was requisite to the philosophical inquirer, and the spirit of doubt was salutary. This was particularly exhibited in the system of skepticism which originated with Pyrrho of Elis (330). A similar spirit subsisted in the middle and new academics, of which Arcesilaus (241) and Carneades (155) were the founders. The Stoic school, founded by Zeno of Citium in Cyprus (342–270), and the Epicurean, of which Epicurus (299–279) was the founder, were chiefly remarkable for the effect that they had in the development of moral speculation in opposite directions, which gradually brought about a great difference in the practice of the adherents of the opposite schools. Mathematics and astronomy made great progress in the schools at Alexandria, Rhodes, and Pergamus. And to whom are the names of Euclid (323–283), Archimedes (287–212), Eratosthenes (276–196), and Hipparchus (160–145) unknown? The expeditions and achievements of Alexander furnished abundant matter to history; but, on the whole, it gained in extent, not in value, since a preference for the wonderful over the actual had now become prevalent. The more gratifying, therefore, is the appearance of Polybius of Megalopolis (204–122), who is to be regarded as the author of the true method of historical exposition, by which universal history acquired a philosophical spirit and a worthy object. Geography, which Eratosthenes made a science, and Hipparchus united more closely with mathematics, was enriched in various ways. To the knowledge of countries and nations much was added by the accounts of Nearchus Agatharchides and others. With respect to poetry many remarkable changes occurred. In Athens the middle comedy gave place not without the intervention of political causes to the new which approaches to the modern "comedy of manners." (See DRAMA.) Among the many poets of this class Menander (342–291) and Philemon (330) were eminent. To this period also belong the celebrated idyllic poets Theocritus (270), and his contemporary Bion, as well as Moschus, who lived about 20 years later. The other kinds of poetry did not remain uncultivated; we may mention the learned poetry of Callimachus and of Lycophron, the epic of Apollonius Rhodius, the didactic of Aratus and Nicander; but all these labors, as well as the criticisms of poetry and the fine arts, point to Alexandria; and we shall therefore pass them over in this place. (See ALEXANDRIAN SCHOOL.) The Septuagint (q.v.) or Greek translation of the Old Testament was a work of scholars of the Alexandrian school. The period subsequent to 146 B.C. is known as the Græco-Roman. Polybius may be placed here as well as the other historians, Diodorus Siculus and Dionysius of Halicarnassus; while in the Christian era we have Josephus, Arrian, Appian, Herodian; the biographies of Plutarch, Diogenes Laertius, and Philostratus, the geographies of Strabo and Pausanias; the astronomy and geography of Ptolemy;

the informatory works of Athenæus, Ælian, and Stobæus; the medical works of Galen; the satirical works of Lucian; and the Greek romances best represented in Heliodorus, Achilles Tatius, and Chariton. See BYZANTINE LITERATURE.

The following are among the best works on Greek literature: K. O. Müller's 'Geschichte der griechischen Litteratur' (4th ed. 1882–4); Bergk's 'Griechische Litteraturgeschichte' (1892–4); Bernhardy's 'Grundriss der griechischen Litteratur' (new ed. 1892); Mure's 'Critical History of the Language and Literature of Ancient Greece' (1854–60); Mahaffy's 'Classical Greek Literature' (1890); Jevons' 'History of Greek Literature' (1890); Croiset's 'Histoire de la littérature grècque (1889–95); Susemihl's 'Geschichte der griechischen Litteratur in der Alexandrinerzeit' (1891–2).

Greece, Modern (Greek *Hellas*), a kingdom in the southeast of Europe, bounded on the north by Turkey, and on all other sides by the sea — the Ionian Sea on the west, the Mediterranean proper on the south, and the Ægean Sea on the east. The mainland forms two chief portions, united by the narrow Isthmus of Corinth; a northern, called Northern Greece or Livadia, and a southern peninsula, called the Peloponnesus or Morea. By far the largest island is Eubœa, only separated from the mainland of Livadia by the narrow channel of Euripo. The other islands form several groups: The northern Sporades on the northeast of Eubœa including Skiathos, Skopelos, Khiliodromia, Pelagonisi, Sarakinon or Peristeri, and Skyros; the western Sporades, chiefly in the Gulf of Egina, or between it and the Gulf of Nauplia, including Hydra, Spetsæ, Poros, Egina, and Salamis or Koluri, the Cyclades; and the Ionian Islands. (See GREECE, ANCIENT.) The capital and largest town is Athens.

Physical Features.— See GREECE, ANCIENT.

Divisions.— Greece is politically divided into 16 nomarchies, which are again subdivided into eparchies, and these again into demes. The following table gives the names of the nomarchies, with the area of each of them, and the population according to the returns for 1896:

Nomarchies		Area in sq. m.	Pop. 1896.
Northern Greece:	Attica and Bœotia...	2,472	313,069
	Phocis and Phthiotis.	2,044	147,297
	Acarnania and Ætolia	3,013	170,565
Peloponnesus:	Argolis and Corinth.	1,442	157,578
	Achaia and Elis.....	1,901	236,251
	Arcadia	2,020	167,092
	Messenia	1,221	205,798
	Laconia	1,679	135,462
Islands:	Eubœa and Sporades.	2,216	115,515
	Cyclades	923	134,747
	Corfu	431	124,578
	Zante	277	45,032
	Cephalonia	302	83,363
Thessaly:	Arta	395	39,144
	Trikkala	2,200	176,773
	Larissa	2,478	181,542
	Total............	25,014	2,433,806

By the law of 17 July 1899 there is a new division into 26 nomarchies, namely: Attica, Bœotia, Phthiotis, Phocis, Ætolia and Acarnania, Eurytania, Larissa, Magnesia, Trikkala, Karditsa, Arta, Achaia, Elis, Eubœa, Cyclades, Kerkyra (Corfu), Leucas, Kephallenia (Cephalonia), Zacynthos (Zante). These are subdivided into 69 districts and 442 communes.

Climate.— In general the first snow falls in October and the last in April. During the summer rain scarcely ever falls, and the channels of almost all the minor streams become dry. The air is then remarkably clear, and a month will sometimes pass away without a cloud being seen. A sudden change, however, takes place toward the end of harvest. Rain becomes frequent and copious; and the streams which had been dried up not only fill their channels, but frequently overflow them, and lay considerable tracts under water. In this way stagnant pools and marshes are occasionally formed, which give rise to intermittent fevers. Compare GREECE, ANCIENT (*Climate*).

Vegetation, Agriculture, etc.— The cultivated land in Greece has recently been estimated at rather more than 5,563,100 acres. There are besides 5,000,000 acres of pasture land, and 3,000,000 acres of waste land. The draining of Lake Copais redeems 60,000 acres of land, which the company divides into holdings of from 5 to 50 acres. English agricultural machinery is being introduced, but still agriculture is in a backward state.

Thessaly is the richest portion of Greece agriculturally. The condition of the agricultural population is said to be very satisfactory. The principal cereal crops are wheat, barley, and maize, but the quantity raised is not sufficient, and much grain is imported. All the fruits of the latitude are grown — figs, almonds, oranges, citrons, melons, etc.— in abundance and of excellent quality, without receiving any great share of attention. The vine also grows vigorously, and considerable quantities of wine are made, some of the sorts being of high quality. But a much more important product of Greece, especially on the coasts of the Peloponnesus, and in the islands of Cephalonia, Zante, Ithaca, and Santa Maura, is the Corinthian grape or currant, the export of which has increased in value from $7,558,350 in 1898 to $8,238,118 in 1900. Another important object of cultivation is the olive, for which both the soil and the climate are alike favorable. The culture of the mulberry for the rearing of silk-worms is carried on to some extent. Some good tobacco is grown. The forests contain, among other trees, the oak (*Quercus Ægilops*) which yields the valonia of commerce. The live stock are neither numerous nor of good breeds. The raising of artificial grasses for their maintenance may be said to be unknown, and the scanty herbage which natural pasture affords must be of little avail. Asses and mules are more numerous than horses; cattle are comparatively few; and the chief animals from which dairy produce is obtained are the sheep and the goat. The quantity of wool produced is considerable, but most of it is of a coarse description.

Manufactures, Trade, Communications, etc.— The manufactures are limited, but with all other branches of industry in Greece are increasing, and are furthered by high duties on imported goods. The employment of the steam-engine in manufacturing industries dates from about 1868, and is yet only developed to a small extent. Piræus is the chief industrial centre, having spinning and weaving factories for cotton, silk, and wool, machine-shops, paper-works, dyeworks, etc. Other centres are Syra, Corinth,

Nauplia, Patras, Larissa. Still, cottons and other textiles form by far the most important part of the imports of manufactured goods. Leather manufactures form an important branch of industry. Marble has been worked from the most ancient period in the quarries of the island of Paros. In 1871 the working of the ancient argentiferous lead mines of Laurion in Attica was resumed with good success; and quantities of manganese iron ore and zinc ore are also raised in this district. The most important branch of manufacturing industry is ship-building, which is carried on at various places. Much of the trade carried on is merely coasting, but the foreign trade also is of considerable extent. A large part of the foreign shipping of Greece is that which deals with the import of the manufactures of England, Germany, etc., into Greece, Turkey, and the Levant generally. In regard to this branch, the peculiar advantages which the Greeks possess in their knowledge of the languages, and acquaintance with the habits and wants, of the people of these countries, have been greatly in their favor. The chief ports of Greece are Piræus (population 42,169, the port of Athens), Syra, and Patras (population 37,958). The principal export is currants (very largely to Britain); but wine, olive-oil, dried figs, raisins, silver, lead, zinc ore, and manganese iron ore, tobacco, sponges, and other articles are also exported; the principal imports are cereals, coals, and cotton and woolen goods. The imports in 1891 were $27,800,260, the exports $21,497,040; in 1901 the imports were $27,773,010. The greatest hindrance to the development of Greece is the want of good roads, which are peculiarly necessary in so mountainous a country. Attention, however, has been directed to the supplying of this want, and there are now over 2,043 miles of roads. Among other public works which have engaged the energies of the Greeks are the construction and restoration of harbors, the erection of lighthouses, the execution of drainage works, etc. In 1883 there were only 58 miles of railways open, but in 1901 603 miles were open, and 300 were under construction. A ship canal across the isthmus of Corinth (4 miles) was opened in 1893.

Weights, Measures, and Money.— The French metric system of weights and measures has been introduced into Greece by the government, but the people still adhere to the old system. In the latter the standard lineal measure was the *pikē*, equal to three quarters of an English yard; the standard square measure was the *stremma*, nearly equal to .242 of an English acre; the standard weight was the *oke* = 2.80 pounds avoirdupois: 44 *okes* were equal to 1 *cantar*, or about 124 pounds avoirdupois. The weights and measures of the metric system are called royal, to distinguish them from the old weights and measures. In this system the French measures of length, millimetre, centimetre, decimetre, and metre are called respectively *gramma, daktylos, palamē*, and *pēcheus* (cubit). The kilometre is called a *stadion*, and the myriametre *skoinis*. The new or royal measures of surface are the square *pecheus* = the square metre, and the *stremma* = the are. The measures of capacity are the *kybos, mystron, kotylē, litra*, and *koilon*, respectively equal to the millilitre, centilitre, decilitre, litre, and hectolitre. The weights for gold, silver, and precious stones are the *kokkos, obolos*, and *drachmē*, respectively equal to the centigramme, decigramme, and gramme. The commercial unit of weight is the *mna* = 1,500 *drachmēs* = 1½ kilogramme. The *talanton* is equal to the quintal, and the *tonos* equal to the tonneau.

In 1875 Greece entered the monetary league of which the other members are France, Italy, Switzerland, and Belgium, and all the members of which have a monetary unit equal to the franc in value. The name of the Greek unit is the *drachma*, divided into 100 *lepta*, nominally equal to a franc but varying considerably in value.

Government and People.— As settled by the present constitution the throne is hereditary according to the law of primogeniture in the family of King George. The king must be a member of the Greek Orthodox Church. He attains his majority at the age of 18. The legislative authority is vested in a single chamber, called the Boulē, the members of which (proportioned in number to the amount of the population) are elected for four years by ballot by manhood suffrage. It meets every year on 1 November, unless called at an earlier date for special business. The executive power is exercised by the king through a responsible ministry. The Greek Orthodox Church alone is established, but all other forms of religion enjoy toleration. The highest ecclesiastical authority, subject to the king, is vested in a permanent synod, which sits at Athens, and consists of five members appointed by the king from the highest dignitaries of the Church. There is 1 metropolitan, who has his seat at Athens, 21 archbishops, and 29 bishops, who are presented and ordained by the synod, and confirmed and invested by the king. Justice is administered, on the basis of the French civil code, by a supreme court (*Areios Pagos*), which has its seat at Athens; five higher courts, one at Athens, one at Nauplia, one at Patras, one at Larissa, and one at Corfu; and a number of courts of primary resort (*Protodokeia*), in the principal towns. The public revenue, derived chiefly from direct taxes, customs, stamps, excise, monopolies, the rent of national property, etc., was estimated for 1900 at $18,519,755, and the expenditure at $17,687,135. Revenue for 1902 was estimated at $23,621,675, and expenditure at $23,621,680. Greece has a very large public debt. In 1899 the amount of this debt was about $152,500,000. A considerable portion of the debt incurred in recent years has been in the way of raising loans for the making of railways. Of the foreign debt one loan is guaranteed by Great Britain, France, and Russia, which have latterly had to pay the dividends on it, and which are now accordingly heavy claimants on Greece. The payment of the interest on its public debt has long been with Greece a matter of difficulty. Every male Greek on attaining the age of 21 years is liable to military service, his term being 2 years with the colors, 10 with the reserve, 8 in the national guard, and 10 in the national guard reserve. The army in 1900 numbered about 25,000 on a peace footing, expanding easily to 82,000 in time of war. The navy in 1903 consisted of 3 armorclad ships, 19 torpedo-boats, besides several unprotected gun-vessels and cruisers. The population contains a considerable intermixture of foreign stocks, among which the Albanese, or Arnauts, are the most numerous; but the great

GREECE.

1. The Academy at Athens. 2. The University at Athens.

majority, though not without some taint in their blood, are of genuine Greek extraction, and, both in physical and mental features, bear a marked resemblance to their celebrated forefathers. It is true that the degrading bondage to which they were subjected for centuries has sunk them far below their natural level, and too often substituted sycophancy and low cunning for the intellectual superiority which, in earlier and better times, displayed itself in immortal productions of the chisel and the pen; but that the original elements of greatness still exist has been proved by the noble struggles which they have made for independence. The educational system of Greece, organized in 1834 by George Gennadius, one of the leaders of the war of independence, is very complete. There are three grades of schools, the demotic or primary national schools, the Hellenic or secondary grammar schools, and the gymnasia, in which, it is asserted, the range and the level of the teaching are much the same as in a German gymnasium or in the upper parts of our public schools. In all three grades of schools education is gratuitous, and in the primary schools it is compulsory on all children between 5 and 12. There is a university at Athens, attended by nearly 3,000 students, many of whom come from districts under the rule of the Sultan. Thus far, however, education seems to be actually diffused among the people only to a limited extent, though the numbers that receive a university education are so great that many such young men find themselves without any proper sphere of employment, and are obliged to adopt the career of politician and place-hunter. Many of these are now, however, said to be finding better ways of turning their education to account through the rapid development of trade and industry. The national dress of the Greeks resembles the Albanian costume. In the men it consists of a tight jacket, generally scarlet, a white linen kilt in numerous folds, a bright-colored sash round the waist, and embroidered gaiters; in the women it consists of a vest or jacket fitting close to the shape, and a skirt, on the head a kind of fez or skull-cap.

History.— From the year 1715 (see preceding article) till 1821 the Greeks were subject to the domination of the Turks. In 1770, and again in 1790, they made attempts at insurrection, which, however, were speedily frustrated. In the early years of the 19th century a secret society was formed for the purpose of effecting their liberation from the galling yoke, and in 1821 they found an opportunity of breaking out into another insurrection, which in the end proved successful. In that year Ali, the pasha of Janina, revolted against the Sultan Mahmoud II., and secured the aid of the Greeks by promising them their independence. The rising of the Greeks took place on 6 March, under Alexander Ypsilanti, and on 1 Jan. 1822 they published a declaration of independence. In the same year Ali was assassinated by the Turks, but the Greeks nevertheless continued the struggle that they had begun, and in which they were encouraged by the sympathy of nearly all the nations of Europe. Among the most distinguished of their leaders were Marcos Bozzaris, Capo d'Istria, Constantine Kanaris, Kolocotroni, Miaulis, Mavrocordato, Mavromichaelis, etc. In 1823 they were joined by Lord Byron, who, during the last year of his life, did all in his power to further their cause by his wealth, as well as by his active efforts on their behalf. Unfortunately he died in April of the following year. In 1825, the Turks having called to their aid Mehemet-Ali, the pasha of Egypt, the latter sent his son, Ibrahim Pasha, whose talents secured them the success that they had hitherto been unable to attain. Tripolitza, the capital of the Morea, was taken, as was also Missolonghi, in spite of the valor of the Suliote mountaineers. It was about this time that the Greek patriots received the aid of the English admiral Lord Cochrane, who organized their fleet, and of the French colonel Fabvier, who instructed their army in the system of European tactics. In spite of this, however, the Turks continued to triumph everywhere, and resisted all the pressure that was put upon them by other European powers to make concessions. A treaty was then concluded at London (6 July 1827) between Britain, France, and Russia, for the pacification of Greece, and when the mediation of these three powers was declined by the Sultan, their united fleets, under Admiral Codrington, attacked and annihilated the Turkish fleet off Navarino, 20 Oct. 1827. In the beginning of the following year (1828) Count Capo d'Istria became president of the state, and later on in the same year Ibrahim Pasha was forced to evacuate Greece. At last, on 3 Feb. 1830, a protocol of the allied powers declared the independence of Greece, which was recognized by the Porte on 25 April of this year. The new member of the states of Europe received from the allies a monarchical form of government, and offered the crown to Leopold, Prince of Saxe-Coburg, and when he refused it, to Otho, a young prince of Bavaria. The latter accepted the offer, and was proclaimed king of the Hellenes at Nauplia, on 30 Aug. 1832. The power of the king was at first almost absolute, and his arbitrary measures, and more especially the preponderance which he gave to Germans in the government, soon made him unpopular. At the same time the finances of the kingdom were in a very embarrassed condition, and a general uneasiness prevailed. In 1843 a rebellion took place, after which a constitution was drawn up. But Otho was after that no more popular than before, and after the outbreak of another rebellion in February 1862, he saw himself compelled to abdicate the throne (24 October). A provisional government was then set up at Athens, and the National Assembly after declaring that the throne had been forfeited by Otho, offered it in succession to Prince Alfred, of England, and Prince William George, of Denmark. The latter accepted it, and 30 March 1863 was proclaimed as King George I. At the end of that year a constituent assembly was elected for the purpose of framing a new constitution, and the result of its labors was the constitution which is still in force. In 1864 an addition was made to the small kingdom by the annexation of the Ionian Islands, which had hitherto formed an independent republic under the protection of Britain. From the first Greece has been watching for an opportunity of extending its frontier northward, so as to include the large Greek population in Thessaly and Epirus. In January 1878, during the Russo-Turkish war, Greek troops were moved into Thessaly and Epirus to the assistance of their brethren who had risen there, but on the remonstrance of England these troops were with-

drawn. The Treaty of Berlin made no definite provisions for any extension of Greek territory, but in 1881 Turkey had to cede about 5,000 square miles of Thessaly to Greece. After the union of eastern Roumelia with Bulgaria, in 1885, war with Turkey was only prevented by the great powers. In 1896 an insurrection of the Christians in Crete led to the interference of Greece and to war with Turkey. The Turks speedily drove back the Greeks from the northern frontier and overran Thessaly; and Greece was enabled only through the efforts of the great powers to obtain reasonable terms of peace. The recent internal political history of Greece relates mainly to her financial obligations. After the expulsion of the Turkish troops from Crete in 1898 Prince George was appointed high commissioner of the island.

Modern Greek Language and Literature.— The Greek language seems to have preserved its purity longer than any other known to us; but a deadly blow was inflicted when the Greeks were enslaved by the fall of Constantinople (1453 A.D.). All the cultivated classes, who still retained the pure Greek, the language of the Byzantine princes, either perished in the conflict or took to flight, or courted the favor of their rude conquerors, by adopting their dialect. In the lower classes only did the common Greek survive (the *koinē, dēmodēs, haplē, idiotikē dialektos*) the vulgar dialect of the polished classes, the traces of which occur, indeed, in earlier authors, but which first appears distinctly in the 6th century. This Greek *patois* departed still more from the purity of the written language — which took refuge at court, in the tribunals of justice, and the halls of instruction — when the Frank crusaders augmented it by their own peculiar expressions, and the barbarians in the neighborhood engrafted theirs also upon it. This popular dialect first appears as a complete written language in the chronicles of Simon Sethos, in 1070–80. After the Ottomans had become masters of the country all the institutions which had contributed to preserve a better idiom perished at once. The people, left to themselves, oppressed by the most brutal despotism, would finally have abandoned their own dialect, which became constantly more corrupt, had not the Greeks possessed a sort of rallying-point in their Church. But even here, owing chiefly to the ignorance and corruption prevailing among the clergy, little could be found to prevent the further debasement of this fine dialect, which continued till the middle of the 18th century. About this time many of the Greeks began to resort for instruction to the universities of the West, whence they returned to their native country to animate their fellow-countrymen with the desire of making nearer approaches to the more civilized nations of Europe, so as not to remain behind in the general progress. One consequence of this was that the Greeks began to pay more attention to their mother tongue, and this tendency was increased by intercourse with the more refined West, by means of more frequent visits from intelligent men of that quarter to the ruins of Grecian greatness. The Patriarch (Samuel Eugene Bulgars Theotokos) of Corfu, and the unfortunate Rhigas, may be mentioned as eminent at this period.

At first a large part of the literature of awakened Greece consisted of translations from the French, but the country now furnishes original writers in every department of literature. Among the theological works of modern Greece perhaps the most remarkable is that on 'Truth,' by Pharmakidis (1852), which is one of the most important works in the modern Greek language. The philosophical and mathematical sciences are all well represented. For these branches of knowledge much has been done by the University of Athens, many of the professors of which have published manuals (some of which have no inconsiderable scientific value) on the subjects on which they lecture. With the exception of poetry, history is perhaps the department which has attracted most writers in the modern Greek language. On this head the long and learned dissertations prefixed by Spiridion Zampelios to his 'Popular Songs of Greece' (Corfu 1852), and 'Studies on Constantinople' (1858), affording valuable and interesting materials for the history of Greece in the Middle Ages, deserve to be particularly mentioned. In the department of philology and scholarship Coray has performed important services by collecting a large mass of materials for acquiring a more thorough knowledge both of ancient and modern Greek; and after him Doukas, Darbaris, Asopios, and Rhangabe, ought to be noticed for their editions of the ancient classics with commentaries in modern Greek. At the head of the orators of the time of the struggle for independence stands Trikoupis, some of whose speeches were collected and published in 1829, and a second and enlarged edition of them in 1860. In the department of poetry a distinction must be made between that of the people and that of the cultivated classes. The former is represented chiefly in the songs of the Klephts and other songs dating from the war of independence, which are a faithful mirror of the public life at the time to which they belong. At this period the war-songs of Rhigas were caught up by the whole nation and sung with enthusiasm. At a later period the two Soutsos, Panagios and Alexander, Calvos, Solomos, and others, earned distinction in the same kind of poetry. The Soutsos were distinguished also as dramatists and novelists, and Alexander also as a satirist. Among the other leading dramatists are Rizos Neroulos and Zampelios. The most distinguished recent author, both a poet and a scholar, is A. R. Rangabé, while Demetrius Bikelas is the chief novelist.

Modern Greek, as spoken by the uneducated classes, is called Romaic, from the fact that it took on its special character at the time when the Greeks considered themselves as natives of the Roman empire, and hence called themselves *Romaioi*, or Romans. The Greek of the educated classes, that used in the newspapers and other literature of the present day, is distinguished from it by a greater resemblance to the Greek of antiquity, which renders it easy for any one who has a satisfactory acquaintance with ancient Greek to read the literary Greek of the present day. The domain of the Romaic comprises not only the whole of the present kingdom of Greece (including Thessaly), but also part of Roumelia, Albania, and Anatolia, the islands of Crete and Cyprus, as well as the islands of the archipelago not belonging to Greece. The purest Romaic is spoken in the

less frequented isles of the archipelago, and in some of the mountainous districts of the interior. It is in these districts particularly that modes of expression are still found belonging to the most classical antiquity. At Megara the language is less corrupt than at Athens, where it is mixed with a considerable number of Italian words. In the northern provinces it is mixed chiefly with Albanian. Besides the foreign words which have been introduced into northern Greek, a pretty large number of words are found which have changed their original signification although they have retained their original form. Ancient words are most commonly found in significations the most remote from the original or derivative sense. The grammar has also undergone considerable modifications. For example, the numbers have been reduced to two by the suppression of the dual; and the cases to four, by the disappearance of the dative, the signification of which is now expressed by means of a preposition with the accusative. The first of the cardinal numerals is now used as an indefinite article. The degrees of comparison are sometimes expressed by the ancient inflexions, but at other times by the use of *pleon* (more). The past tenses of the verb are formed by the aid of the verb *echō* (I have), and the future tenses by the aid of *thelō* (I will). The infinitive mood, which has fallen out of use, has its place supplied by a periphrasis, in which the verb is put in the subjunctive. The middle voice has disappeared, and what remains of the old conjugation is of so little consequence that it may be regarded as an irregularity. The ancient orthography of the language is still preserved, but considerable changes appear to have taken place in the pronunciation. The vowels η, ι, and υ, and the diphthongs ει, οι, and υι, are all pronounced like *ea* in the English word *mean*. Β is now pronounced as *v*, and the sound of *b* is expressed by μπ. Δ is pronounced like *th* in *thus*, and θ like *th* in *think*.

Greek Architecture. *First*, that which has existed in Greece, that is the land of the Hellenes, which, for art purposes, includes everything south of Mount Olympus on the east coast and the Island of Corfu on the west. This architecture is of several very distinct epochs. *Second*, the architecture identified with the Greek spirit at the time of the highest intellectual development of the race — viz. from about 500 B.C. to the Roman Conquest; and which is in architecture represented by the famous styles called Doric and Ionic, with the Corinthian just appearing at the time when the freedom of Greece was at an end. Each of these definitions of the term requires separate treatment.

First.— The architecture of the land of Greece is known to us in its earliest form by certain tombal chambers, in which a circular or polygonal room is enclosed and roofed with stone by one operation, that is, by laying the stones in courses continually projecting inwards, and so decreasing the size of the chamber within, until at last a single cap-stone closes the aperture at the top. These stone structures had passages leading to them, enclosed and roofed with stone; and these passages allowed of the covering in of the whole stone edifice with earth, perhaps in huge, high mounds. In this way, as in northern Europe and also in the peninsula of India, a great funereal monument was erected which cost nothing but the labor of transporting many thousand tons of earth and rough stone in addition to the comparatively slight building of the stone chamber and passage. The largest of these is among the ruins of Mycenæ, and has been known for many years as the Treasury of Atreus. More elaborate buildings are of what is known as the Mycenæan epoch (see MYCENÆAN) which is not accurately fixed, but which it is customary now (1904) to place at about 1700 B.C., lasting perhaps for 500 years. The name Mycenæan comes from the city of Mycenæ, explored first by Dr. Schilemann in 1876. We know only its remains, painting upon walls, inlays of metal, pottery and the like, and something is known of the plan of the royal palace and its accessory buildings; but no part of this enables us to fix the date. If we assume that this artistic civilization lasted until about 1200 B.C. there is less a lapse of time before the Homeric conditions began; for the palaces and fortresses described in the Iliad are generally accepted as of about 1,000 B.C. Again a blank occurs, and the earliest buildings of the Proto-Doric may be thought to begin about 600 B.C.

For the classical art of Greece, that is the building of the celebrated and beautiful temples, see the second part of this paper. This classical epoch lasts until the Roman conquest, and even beyond it in a modified form. Thus the gateway of the Agora in Athens is Doric of a style not used until the Roman control had begun; and it is extremely curious to compare this with the Doric of 500 years earlier. The Roman governors and generals built memorial buildings, porticoes and temples in a curiously modified style, partly pure Greek, partly of that Romanized Greek which was beginning to be recognized as the Imperial art for the whole Mediterranean world. Under the reign of Hadrian an attempt was made to return to a purer taste, but this was of brief duration. Greece was not to have an art of her own again until the Byzantine style was well established (see ARCHITECTURE and BYZANTINE ARCHITECTURE). The Byzantine style in the land of Greece was singularly characterized by very small proportions; there has never been an interesting style of which the monuments are so diminutive; important churches exist in Athens and other cities which would not hold two hundred persons and which are delicately built in a refined shape, and prettily if not richly decorated. The architecture of modern times in Greece is not more intelligent than that of the rest of Europe, while it is very simple and inexpensive. The country is small and poor, and even a royal palace cannot have much costly treatment; moreover the buildings in Athens are mostly of German design, according to the taste of the first dynasty established there after the freeing of Greece in 1823.

Second.— Grecian architecture in the sense of the classical style begins with what we call the Proto-Doric style as exemplified by the temple at Corinth, a building with low, thick columns and a comparatively high entablature, as far as can be ascertained. It is thought by some that the Heraion (that is the temple of Hera) at Olympia, is a still older building, and in that

case the earliest piece of classical Greek architecture. It is curious in form, as it has six columns at each end with sixteen on each side, the corner columns being counted twice, that is to say, there are forty columns in all. The peculiarity of this will be seen when we speak below of the perfected type of Doric temples. In the Olympia building the columns are of different sizes, varying even more than a foot in their thickness, and the capitals also differ. The common explanation, that the columns were originally of wood and were replaced by stone, one at a time, at all events points to the extreme irregularity of the structure. The Doric buildings of accepted and permanent type may thus be thought to appear first at the beginning of the 5th century B.C. The Greek colonies in southern Italy and Sicily were flourishing at this time and we find some of the earliest Doric temples of classical form in Pesto (the Roman Paestum, the Greek Poseidonia), in Campania and in Selinunte and Girgenti in Sicily. The style rapidly took definite form and was reduced at an early date to a very definite set of rules. Thus it became a recognized arrangement that the columns on the flank of the peristylar temple should be twice as many as those on the front and one more: the corner column being always counted twice. Thus the hexastyle temples at Athens, in Pesto and elsewhere, having 6 columns in front, have 13 on the side; and the only two octostyle Doric temples known — the Parthenon at Athens and the great temple at Selinunte — have 17 columns on the side. But all temples were not peristylar; on the contrary by far the greater number had porticoes only at the east front or at the east and west end. The essential parts of the temple are, of course, the closed naos or, as the Romans called it, the cella, in which the statue of the divinity was preserved, together with certain treasures, consecrated gifts and the like. There must have been thousands of these little shrines in Greece, the Greek islands and the colonies. A somewhat larger temple would have a second chamber, the treasury (opisthodomos) at the rear or west end of the cella, and this would have its own portico. The Temple of Theseus (so called) at Athens seems to have had a single chamber and two porticoes, one at either end, these being deep and sheltered and affording place for certain sacred statues and the like. Larger temples, like the Temple of Zeus at Olympia, the Parthenon at Athens, and the one at Pesto, called the Temple of Neptune, have the interior of the cella divided into a nave and aisles by two rows of columns; but just what the connection was between these columns and the carrying of the roof is not rightly understood. Some archæologists associate them with the assumed arrangement for admitting daylight into the interior through the roof (see HYPÆTHRAL THEORY).

The style of design was this — the columns were thick in proportion to their height and tapered from bottom to top, but not as a cone tapers, for the diminution of thickness follows a decided and even visible curve which is called the entasis. These columns are channeled from top to bottom by grooves, usually twenty in number, each having an elliptical curve or nearly so and meeting one another at sharp arrises. These shafts carried capitals made of one or two blocks of stone but always in two architectural parts. The lower part is what is called the echinus. It is a circular slab of stone projecting all round as much as half the diameter of the shaft in the earliest examples, perhaps a quarter of that diameter in the later ones; and this projection is rounded in a very subtle way, becoming flat below near the shaft and rounding more rapidly above. The curve of some of these echinus capitals is of extraordinary beauty. The uppermost member of the capital is a thick square block, or die, or plinth, sharp-cornered, without ornament of any sort except for the painting. These columns carry the epistyle or architrave, which, in the Doric style, is usually plain. Upon this rests what is known as the frieze, which consists of a series of upright blocks of stone perhaps half as high again as they are wide, and their height increased in appearance by grooves running vertically. These triglyphs carry, or seem to carry, the third or crowning member, the cornice, but between the triglyphs are the spaces called metopes, which are commonly filled by slabs or blocks of stone, the outer surface of which was always a favorite place for ornamentation. The cornice projected very much beyond the frieze, and its under side was cut with a drip moulding so that rain-water would not back up and run down the entablature, that being the name given to the three parts taken together, that is, to the whole horizontal superstructure laid upon the columns. There was nothing above this cornice except at the two ends the rising gable which marks the slope of the roof (see PEDIMENT), and on the side a gutter for rain-water with spouts or scuppers in its outer space.

The building of the temple was in this way as simple as possible — square cornered, oblong, roofed with a simple gable-roof, without arches or windows or chimneys. Its decoration was largely in the extreme refinement of the parts. The proportion of height to width, the spacing of columns and their shape and character were helped out by an extraordinary system of curves by which a grace was added to the building which the eye could hardly follow in its cause or character, but which changed the whole aspect very greatly. Thus the entablature was cut with an upward curve toward the middle and in this way the whole building had a lighter aspect than if it had been strictly horizontal. The same upward curve was repeated in the stylobate or stone floor on which the columns stood. The columns themselves were curved in outline as above stated, and they were set so as to slope inward, the outer ones the most, this for the obvious purpose of making the building seem more solidly set upon its base. To the building so carefully designed there was often added a great deal of elaborate sculpture (see below) and, apparently in all cases, rich chromatic decoration. For this subject see POLYCHROMY; but it may be mentioned here that the modern world has no very clear notion of what was the effect of brilliant painting in red and blue, with gilded metal, applied to a marble building standing high upon a prominent rock in the heart of a town, the recognized centre of interest and the chief religious shrine. No living man has ever seen anything at all like that; and it is probable that no imagination can reproduce it in thought.

To the modern student, the Doric style as described above, is much the most important part of Grecian architecture; but to a Greek of the time of Alexander the Great the Ionic temples along the shore of Asia Minor would have seemed the more grand and costly, the more recent, and therefore the more identified with advanced civilization. Those great temples have disappeared with a strange completeness. While there are Doric temples nearly complete except for the roof — which has, of course, disappeared,— while there are many others of which large and most interesting remains exist, many columns standing erect and some parts of the superstructure,— there is almost nothing remaining in complete condition of all the great Ionic temples. It is on this account that the exquisite building on the Acropolis at Athens, the Erectheum, contains in itself almost all our modern notions of the style. Very near it on the Acropolis is the little square amphiprostyle temple, known as the Temple of Athenæ Nike, or as the Temple of the Wingless Victory, and this shrine may also be considered an unchanged Greek building, because, though it was entirely destroyed, the stones of it were found built into a Turkish fortification and the whole structure was piled up again by the engineers of the first European king of Greece, Otho of Bavaria, who reigned from 1832 to 1862.

We learn from these buildings what the style really was. The shafts of the columns are much more slender than those of the Doric style and are fluted with circular grooves which are separated from one another by narrow fillets instead of meeting at a sharp edge. There is a base composed of mouldings running around the column. The capital is very peculiar, having volutes or scrolls at either side so that each capital has a front and a back precisely alike, and two ends alike, differing from all other capitals in not being alike on at least four sides. The members of the entablature are the same as those of the Doric style, but there are important differences in them. Thus the epistyle, instead of being a plain smooth block, is divided into three parallel surfaces, each one slightly overhanging the one below; the frieze is continuous and not broken by triglyphs; the cornice is more richly sculptured. Figure sculpture is applied in a somewhat different way. Thus as the frieze has no triglyphs it may be carved continuously; and in the Erectheum the sculpture is in the form of statuettes in white marble secured to a gray marble ground. It is not quite decided whether this color effect was helped out by painting or gilding, and how far the other parts of the temple were painted in bright colors. Again in the famous temple of Artemis (Diana) at Ephesus, the lower part of the shafts of the columns was in some cases very richly sculptured. The term *columna cælata* is applied to one of these columns and in any one of them is found this unique device:— the base is rather unusually high and is divided up by many mouldings; beginning about four feet from the pavement is a circle of figures larger than life surrounding the lowermost of those blocks of marble which make up the shaft proper; the flutings then begin above the band of sculptured figures and stop beneath the capital in the usual way. Not all the columns were arranged in this way, apparently only about one fourth of the whole number. The ancient Temple of Artemis which existed before the later magnificent structure was built had the same singular arrangement of sculptured shafts. Near Ephesus there have been found some capitals in which the head and shoulders of a bull project on either side beyond the volutes of the capital; and on the Island of Delos there are capitals made up entirely, so far as their decorations are concerned, of the heads of bulls. In the Erectheum of Athens there is that wonderful Portico of the Maidens in which an entablature made up of peristyle and cornice alone, without frieze, is supported on the heads of six caryatides, that is, draped female statues. In the National Museum at Athens are some caryatides of another portico. In the Incantada, a ruined Greek building in Salonica, there is a row of caryatides high up in the wall. The pilasters are treated with capitals of a curious style of Asiatic sculpture in the temple of Miletus. If to this we add the extraordinary capitals which some few monuments possess, monuments which must be called Grecian, but which are quaint and barbaric in appearance and almost grotesque, it appears that the Ionic was not as disciplined a style as the Doric but was influenced by the highly decorative sense of the Asiatic peoples and allowed of great variety of decorative design.

The Corinthian style is so little known to us as of Greek invention and use that it is almost always considered as a Roman or at most a Greco-Roman style; but the unquestionably Greek building, the little choragic monument of Lysicrates in Athens is Corinthian and the equally unquestioned and much more splendid round building at Epidaurus, was absolutely Greek, of pure type, and possessed a Corinthian order; the capitals completely developed. The dates are approximately, of the Athens building, 335 B.C.; of the Tholos, about the middle of 4th century B.C. The Athenian monument stands tolerably complete. The round building at Epidaurus is ruined and the capitals much scattered, but a single capital was found in a cellar or a chamber built for that purpose, and evidently intended to preserve it as a pattern, and this is intact. It is also one of the most beautiful Corinthian capitals known to us. The style, however, is almost identified with Roman work and will be treated in connection with ROMAN IMPERIAL ARCHITECTURE.

RUSSELL STURGIS.

Greek Art. Modern students of Grecian archæology do not doubt that the Greeks of different epochs were as successful in painting of stately and religious subjects and of painting and drawing in a slighter and more popular way as they were in sculpture; but this is merely an inference. Absolutely nothing remains to us of Greek painting of high class. We can study the figures on Greek painted vases and notice their admirable disposition and the beautiful designs made of their combinations, and we can note the technical system followed, sometimes by drawing on the clay with a hard point, sometimes without that help and drawn evidently with the brush alone. The use of pigment, too, generally black but sometimes of other colors, can be perfectly understood; but this is all of the simplest character, nor can we draw any conclusions at all about the wall-paintings or panel-paintings

of the Greeks. In the houses of Pompeii there are many wall-paintings which seem to have had a non-Italian and probably Greek origin, and furthermore it is known that Pompeii was a town of Greek settlement and retained much Grecian influence even under the Roman Empire. Some portrait heads have been found in Egypt painted on panel (that is, thin boards) and these are certainly non-Egyptian; they may be assumed to be Greek, of the Alexandrian epoch. In these, however, there is no background, no added incident, which might guide us to a knowledge of Greek design in Graphic art. Finally, some paintings discovered in Rome, though belonging to houses of late date, are altogether Greek in design; and these may well be reduced copies, or imitations, of famous originals three hundred years earlier. None of these paintings are of great importance. None of them give us an exalted idea of the painting which stood for their original impulse. The statements made by ancient writers with regard to the paintings of their own time and those who were then famous as having belonged to earlier times, are of very little use, because we have no standard with which to compare their critical remarks, and furthermore because no one of the books remaining to us from antiquity seems to be the work of a man greatly interested in fine art. For this reason the paintings on the vases are worthy of the most minute examination. The earliest style in which the subjects represented are at all elaborate are of the undetermined epoch which we call the Mycenæan. Those vases are rich in patterns of scrolls, bands, zigzags and spots with, somewhat rarely, animal forms introduced in bands and (as in Crete and Cyprus) as a principal subject and covering a large part of the body of the vase. The painting is generally in brownish red on a dull yellow ground, which is the natural color of the clay. The famous Warrior Vase found at Mycenæ and now in the Central Museum at Athens and which we must suppose to date from 1000 B.C., has much of that grotesque indifference to form and perfect satisfaction with an indication of meaning which we associate with barbaric art in all ages: the human form is drawn without any comeliness or grace and without any success in getting control of gesture; but the purpose is clear, viz., the displaying of a procession of warriors wearing large helmets, carrying great shields of the curious kidney shape long afterward associated with certain Asiatic influences, and carrying spears in the right hand, which spears have sometimes two heads or what seem to be heads.

The paintings on pottery which are of the most interest are those of the period beginning about 600 B.C. and ending about 150 B.C. The earlier pieces are, of course, difficult to date even approximately. They represent warriors engaged in battle, the scene forming a broad band running around the vase; lions, bulls and stags arranged again in horizontal bands; figures draped in long garments, men as well as women carrying stringed instruments, weapons, baskets and the like; occasionally a scene which can be identified, as where Hercules brings the Erymanthian boar to show to his brother, king Eurystheus, or where Peleus is about to carry off Thetis from among her attendant nymphs; or they represent a feast, with men reclining on couches and others acting as attendants bringing pitchers and vases to fill the cup held by the reclining guest. The beautiful black glaze of the vases is used sometimes as the pigment for the figures and sometimes to work the background around the figures. These two styles are known as the black-on-red or black-figure style, the other as the red-on-black or red-figure style, and this latter style is known as the later of the two. There is still another form which is generally the latest of all. In this the black glaze is worked over the whole vase except for a panel or medallion or even a band around the vase, which is left in the red color of the pottery, and upon this the figures are painted in black. From the 5th century on the drawing is extremely vigorous and significant. It is grotesque sometimes, as where the muscles are given excessive prominence or where the attitude is exaggerated in the attempt to make it tell the story; but everywhere the drawing of the outline and the filling in with color shows singular mastery.

In a few cases the drawing itself is faultless; but in by far the greater number of cases, even of a good time, it is rather the evidently slight and swift work of a man familiar with nature and with the best traditions of art but not using his whole strength in the slight painting of the earthenware. The use of pigments other than the black glaze is not very frequent; but a red somewhat brighter than the color of the clay is used, also a kind of violet, more rarely a green, and in some cases gilding is applied — especially in late and very elaborate work. A small class of vases, identified with the city of Athens, has the body covered with a solid coat of white, upon which figures are painted in various bright colors; but this work is perishable.

In close connection with the drawing and painting applied to pottery is the engraved work on the backs of bronze mirrors, on pieces of armor, and on cists (*cistæ*). Even as in modern times some of the most elaborate and precious drawing is that of the engraver working on copper-plate (though he proposes to take prints on paper from his engraving), so the Grecian draughtsman put some of his finest work on those engravings meant for pure decoration. As we have no free drawing on paper or plaster or wood — nothing that shows how the Greek drew with a free hand — we can only reason backward from the firm and resolute setting down of lines drawn on the resistant material with the sharp point, and infer the vigor and daring of the more unfettered design.

Sculpture in its different forms is, after all, that which Greece has left us which is most important. We have the marble reliefs carved upon temples, tombs, and the walls of sacred enclosures, and also a great number of slabs which, when more than two or three feet in either dimension are generally tombstones, but which, when small, are frequently mere records carved upon a boundary stone or a memorial, or else a votive slab dedicated at the shrine of some divinity. In all of these the propriety and the freedom of design are wonderful and, in relief sculpture at least, the Greeks have set an example which has never been equalled since, neither in the actual beauty of the form nor in the intelligence shown in the composition. The

GREEK VASES

GRECIAN ART.

most wonderful of the low reliefs are those of the famous frieze which forms the crowning member of the wall of the Parthenon within the screen of columns, the wall of the naos or cella. The well-known fact that this whole composition was painted in bright colors changes at once our ideas as to its decorative effect as a part of the building, but modern students can form no correct idea of the appearance of elaborate sculptures painted in an artistical fashion because they have never seen anything of the kind. One special reason why the reliefs are peculiarly important to modern students is their undoubted originality. The sculptures found at Phigalia, at Halicarnassus, at Xanthos, and at Gjolbaschi in Asia Minor are the undoubted work of the 4th and 5th centuries, and moreover they were designed for the places in which we now find them. This is not so with statues and busts, for of all the great world of Grecian statuary only three or four undoubted originals of the first rank remain. The Hermes of Praxiteles was found as Pausanius saw it in the 2d century A.D.; the Winged Victory of Paionios also; and these two were found in the excavations at Olympia in Greece. Statues of somewhat less importance have been found in the islands of the Greek archipelago and in specially protected underground chambers in the mainland of Europe, and a number of splendid bronzes, were found in a single great country house at Herculaneum near Naples; but as a general thing it has to be settled by internal evidence whether the piece discovered is of unmingled Greek character or of a less simple and perfect later style. The statues of the pediments, however, those which once stood at either end of the Parthenon, the Temple of Zeus at Olympia, the great temple of Ægina, and those which seem to have been placed between the columns of the Nereid Monument at Xanthos, are almost as certainly of their apparent epoch as are the bas-reliefs of the same buildings. In this way we have a score of fairly complete marble statues, two or three bronze statues of the highest rank, and a dozen less important ones, a score of life-size busts, and many smaller bronzes, all of which are assuredly of the best time of Greek art. Our knowledge of this subject is greatly helped by the study of engraved gems and coins. The gems were used for seals, or set in finger rings worn hung by a string, and the materials used were, of course, very hard stones, such as chalcedony and sardonyx; though glass was used also, and some seals are engraved in gold. The figure engraved in intaglio can be seen as if in relief when the stone is transparent and is looked at from the back. But commonly the student takes a cast in plaster or wax and studies that relief together with the original hollow sculpture of the gem. The number of these gems in our public and private collections is very great, even if we consider only those of undoubted Grecian origin. The coins are, in art, of the same character as the gems, because they are struck from a die, which die has been engraved in the same way in which the intaglio in hard stone is engraved: that is, the artist in either case keeps in mind the future relief and carves his hollow or sunken design rather with a view to its utility as a die than as to its own appearance. Greek coins are the subject of much and careful study among modern students. Greek sculpture includes also the earthenware figurines which have been found in great number in the neighborhood of Smyrna, in Sicily and the other islands of the Mediterranean, and especially in the neighborhood of Tanagra in Greece.

The years since 1850 have been rich in books on the subject of Grecian archæology, which archæology is, in great measure, the study of the existing works of art; books on Grecian vase-painting, gems and coins are to be counted by scores and hundreds. The latest are generally the best to begin with. The student will find in them the best means of judging what earlier books he may need; and at the same time he will find the latest discoveries and the most mature opinions of archæologists. The same remark applies to the periodicals, of which there are many and very valuable, for indeed much of the comparative study of this subject has been carried on in the columns of German, French and English periodicals, often issued by learned societies.

RUSSELL STURGIS.

Greek Church, or Holy Oriental Orthodox Apostolic Church, that section of the Christian church dominant in Eastern Europe and Western Asia, especially in Turkey, Greece, Russia, and some parts of Austria. In the first ages of Christianity numerous churches were founded by the apostles and their successors in Greek-speaking countries; in Greece itself, in Syria, Egypt, Mesopotamia, Asia Minor, Thrace, and Macedonia. These were subsequently called Greek, in contradistinction to the churches in which the Latin tongue prevailed. The removal of the seat of empire by Constantine to Constantinople, and the subsequent separation of the eastern and western empires, afforded the opportunity for diversities of language, modes of thinking, and customs to manifest themselves, and added political causes to the grounds of separation. During the earliest period the chief seats of influence in the Eastern Church were Jerusalem, Antioch, and Alexandria, the seat of that mystical philosophy, by which the oriental church was distinguished. In 341, soon after the synod of Antioch, the rivalry between the Bishop of Rome and the Bishop of Constantinople began to assume importance, and before the year 400 differences of doctrine with respect to the procession of the Holy Spirit appeared. The Council of Chalcedon in 451 reaffirmed the "pre-eminence of honor" after Rome, which had been granted Constantinople by the Second General Council in 381, but also accorded to its bishop supremacy, not only over Thrace, but over Pontus and Asia. This canon, the famous 28th, Rome refused to confirm. The title of *Œcumenical Patriarch* was assumed by John, bishop of Constantinople, in 588, and in the following year the phrase 'Filioque' ('and the Son') was added by the Latins to the Nicene Creed (which now read 'proceeding from the father and the son'), an addition to which the Greek Church was opposed. In 648 Pope Theodore deposed Patriarch Paul II.; but a reconciliation of the churches was effected at the Council of Rome (680). The doctrines of the Greek Church were defined by John Damascenus in 730. The disruption was hastened by the banishment of Ignatius by Michael the Drunken, and the consecration of Photius (858). Pope Nicholas I. refused to sanction

the usurpation of Photius and excommunicated him. The schism was temporarily healed after the death of Photius, but Michael Cerularius reopened it by charging the Latins with heterodoxy. He was excommunicated by Leo IX. in 1054, since which the Greeks have been severed from the Roman communion, though the Russo-Greek Church was not separated until the 12th century. The presence of the Crusaders in the East aggravated the quarrel; Latin patriarchates were established in Antioch and Jerusalem, and, though on the capture of Constantinople by the Crusaders a Latin patriarchate was set up there (1204), the schism was revived there as soon as the Latin empire fell (1262). Reunion was proposed in 1273 by Patriarch Joseph, and effected, with the acknowledgment of the pope as primate, at the Council of Lyons (1274). The union, however, was annulled in 1282 by Emperor Andronicus II., and in 1283 and 1285 by synods of Constantinople. It was again effected under John Palæologus at Florence in 1439, but was repudiated in 1443 by the Patriarchs of Alexandria, Antioch, and Jerusalem. In 1453, when the patriarch fled from the Turks, a schismatic, Gregory Scholarius, was chosen in his place. In 1575 unsuccessful negotiations were commenced with a view to union with the Lutherans, and in 1723 the English bishops even proposed that the Greek and Anglican churches should unite, a proposal revived by the archbishop of Moscow in 1866. The claims of the czar in 1853 to the protectorate of the Greek churches in Turkey was one of the causes of the Crimean War.

The Greek Church is the only church which holds that the Holy Ghost proceeds from the Father only; the Roman Catholic and Protestant Churches deriving the Holy Ghost from the Father and the Son. Like the Roman Catholic Church it has seven sacraments — baptism; chrism; penance, preceded with confession; the eucharist; ordination; marriage; and unction. But it is peculiar (1), administering baptism by threefold immersion, the chrism (confirmation) following immediately after it; (2), in adopting, as to the eucharist, the doctrine of the real presence and transubstantiation; but in ordering the bread to be leavened, the wine to be mixed with water, and both elements to be distributed to every one, even to children; (3), the parochial clergy are required to be married, but only once and to a virgin, and marriage must take place before ordination; widowed clergy are not permitted to retain their livings, but go into a cloister, where they are called *hieromonachi.* Rarely is a widowed bishop allowed to preserve his diocese. The Greek Church grants divorce in case of proved adultery, but it does not allow even the laity a fourth marriage. It differs also from the Roman Catholic Church in anointing with the holy oil, not the dying but the sick, for the restoration of health, forgiveness, and sanctification. It rejects the doctrine of purgatory, works of supererogation, indulgences, and dispensations, but admits prayers for the dead, whose condition appears to be considered undetermined until the final judgment. It recognizes no visible vicar of Christ on earth, but the spiritual authority of patriarch is little inferior to that of the pope. It allows no carved, sculptured, or molten image of holy persons or subjects; but the representations of Christ (except in the crucifix), of Mary, and the saints, must be merely painted, and at most inlaid with precious stones. In the Russian churches, however, works of sculpture are found. In the invocation of the saints, and especially of the Virgin, the Greeks resemble the Latins. They also hold relics, graves, and crosses sacred; and crossing in the name of Jesus they consider as having a wonderful and blessed influence. Among the means of penance, fasts are particularly numerous with them. They fast Wednesday and Friday of every week, and besides observe four great annual fasts, namely forty days before Easter; from Whitsuntide to the days of Sts. Peter and Paul; the fast of the Virgin Mary, from the 1st to the 15th of August; and the apostle Philip's fast, from the 15th to the 26th of November; besides the day of the beheading of John the Baptist, and of the elevation of the cross. The calendar of the Greek Church is in the old style, their New Year's Day falling on 13 January.

The services of the Greek Church consist almost entirely in outward forms. Preaching and catechizing constitute the least part of it. Instrumental music is excluded altogether. The Mass is considered of the first importance. The convents conform, for the most part, to the strict rule of St. Basil. The Greek abbot is termed *hegumenos,* the abbess *hegumenē.* The abbot of a Greek convent which has several others under its inspection is termed *archimandrite,* and ranks next a bishop. The lower clergy in the Greek Church consist of readers, singers, deacons, etc., and of priests or popes and protopopes or archpriests, who are the first clergy in the cathedrals and metropolitan churches. The members of the lower clergy can rise no higher than protopopes, for the bishops are chosen from among the monks, and from the bishops are selected the archbishops, metropolitans, and patriarchs. In Russia there are twenty-four dioceses. With which of them the archiepiscopal dignity shall be united depends on the will of the emperor. The seats of the four metropolitans of the Russian Empire are St. Petersburg, Kiev, Kasan, and Tobolsk. In the Turkish dominions the dignities of Patriarch of Constantinople, Alexandria, Antioch, and Jerusalem still subsist. The Patriarch of Constantinople still possesses the ancient authority of his see; the other three patriarchs exercise a very limited jurisdiction, and live for the most part on the aid afforded them by the Patriarch of Constantinople.

The United Greek Churches comprise those Churches of Greek rite which are in communion with the See of Rome: the adherents of these Churches are commonly styled Uniates, and the Churches Uniate Churches. There are five such Uniate Greek Churches, namely, those of the Melchites, of the Ruthenians, of the Greek Catholics of Italy, of the Græco-Romaic rite, and of the Bulgarians. These several Churches retain their several Greek or Oriental liturgies and sacramental rites and most of the usages and ceremonies of the Eastern schismatical Churches from which they are sprung.

The Melchites represent those Churches of Syria and Egypt which, in 1686 and later, seceded from jurisdictions of the Monophysite patriarchs of Antioch, Jerusalem, and Alexandria. Their number is small, perhaps not exceeding 50,000 souls, but they have three patriarchs, with bishops subordinate to them.

The Ruthenian United Church is an offshoot of the Russian Greek Church by secession; the membership of this Church in Russian Poland and in the Austro-Hungary monarchy comprises probably 1,000,000 souls.

The United Greeks of Italy, mostly in Calabria, are estimated at 30,000.

The Græco-Romaic Church of Hungary and Transylvania has about 1,000,000 adherents.

The United Bulgarian Church dates from 1860, when several bishops with a considerable following of their people were received into the communion of the Church of Rome.

All these Churches retain the ancient Greek liturgies of the Eastern Churches from which they seceded, and to a great extent their ancient systems of discipline. The priest, as in the Greek orthodox and in the Russian orthodox Church, must be married, and the bishops must be celibates: hence the bishops are usually chosen from the monastic order. The widowed priest is not permitted to contract a second marriage. In short, these Churches retain, of the religious practices and of the discipline of the several Eastern Churches from which they seceded, whatever is not inconsistent with allegiance to the supreme pontiff in matters of doctrine.

The language of the Ruthenian United Church's liturgy is Old Sclavonic, and translated from one of the ancient Greek liturgies. The liturgy of the Melchites is that of St. John Chrysostom, and on certain occasions that of St. Basil, both in the original Greek. The liturgy of the Bulgarian Church is also of Greek origin, but translated into an ancient Sclavic idiom.

Greek Fire, a combustible composition made probably of naphtha, sulphur and nitre, which was first used in 673 A.D. by the Greeks of the Byzantine Empire against the Saracens. Its invention has usually been ascribed to Callinicus of Heliopolis, and to the year 668 A.D. The mixture appears to have been highly inflammable, and to have been difficult to extinguish; was poured out, burning, from ladles on besiegers, projected out of tubes to a distance, or shot from balistæ, burning on tow tied to arrows. At Constantinople the process of making Greek fire was kept a secret for several centuries; but the knowledge of its composition and the use of it, gradually spread to the West. It was in use for a short time after the invention of gunpowder. Combustibles of a similar kind were used at the siege of Charleston in 1863, composed of sulphur, nitre, and lampblack: and naphtha in shells was also tried.

Greek-letter Societies, or **College Fraternities**, are found in nearly all leading educational institutions, particularly the great universities, in the United States. Branches of the various societies are known as "chapters," and are found in nearly every college as well as in every large city in the country. No society has more than one chapter in any one college. While these societies are secret in character there is neither ritual nor mystery in their conduct, the protection of meetings, constitution and mottoes being all the secrecy involved. The Greek alphabet is generally used in naming a fraternity, or a chapter. There are three types of badges worn by members, the name badge, monogram badge, and symbol badge. In the latter a key, skull, or scroll is usually employed.

The oldest of these literary and social brotherhoods was established as early as 1776, and continued the sole society of its kind for 50 years. There were in 1902 more than 800 chapters of these societies in American colleges, with a membership including the alumni, of more than 100,000. It has become quite the practice for students of a particular fraternity to reside together during their college course in their "chapter" house. In 1901 there were 70 such houses in the United States owned by the "chapters," and 200 other houses rented by them. Princeton is the only prominent college in the country where the fraternal society is prohibited, and the fact that all the other leading institutions permit these organizations to exist affords strong presumption that they are regarded with favor, and that their influence is for good rather than for evil. In 1902 there were 25 of these societies for men and 8 for women, in the universities and colleges of the United States.

Phi Beta Kappa.— This, the oldest organization, is composed of 53 college chapters, and was founded 5 Dec. 1776, at William and Mary College, Williamsburg, Va. A chapter was formed at Yale, in New Haven, in Dec. 1779, and soon after at Harvard, Dartmouth, Bowdoin and Amherst. The society in 1902 had a membership of 11,000. The national council meets triennially. The badge of the society is a golden key. Among prominent members are T. W. Higginson, Seth Low, Joseph H. Choate, and H. W. Mabie.

Kappa Alpha.— Founded in 1825 at Old Union College by four members of the Phi Delta Kappa. It likewise had a golden key as a badge design. The first branch of this society was established at Williams College. The society had 1,000 members in 1902, prominent among them being Wheeler H. Peckham, John Boyd Thatcher, L. Clark Seelye, and Edward S. Bragg.

Sigma Phi.— Founded at Union College, Schenectady, N. Y., 4 March 1827, the society established branches at Hamilton, Williams, Hobart, Lehigh, Cornell and the Universities of Michigan and Vermont. It had a membership of 1,400 in 1902. The badge of the society is of the monogram type; the colors are light blue and white. Among its members are Elihu Root, Andrew D. White, and John H. Post.

Delta Phi.— Founded at Union College, 17 Nov. 1827, this society established branches at Columbia, Rutgers, Harvard, Johns Hopkins, Cornell, and other colleges. The badge is in the form of a Maltese cross; colors blue and white. There are several thousand members, among them John Jacob Astor, Ernest Howard Crosby, and R. O. Doremus.

Alpha Delta Phi.— Founded at Hamilton College, Clinton, N. Y., in 1832, the society established chapters in 10 other colleges and had a membership of 8,400 in 1902. There are 16 houses owned by the society and 24 active chapters. The badge is of green and white, with the star and cresent as symbols. Among prominent members are W. R. Day, Bartow S. Weeks, Henry Clews, Jr., Jas. K. Hackett, and H. E. Lippincott.

Psi Upsilon.— Founded at Union College, 24 Nov. 1833, this society had 4 of its original founders still living in 1902. The membership of the organization is over 10,000, with 22 chapters in various colleges. The badge is of gold, dia-

mond-shaped; colors garnet and gold. Among its members are Chauncey M. Depew, Wm. C. Whitney, G. R. Schieffelin, and Herbert L. Bridgeman.

Delta Upsilon.— Founded at Williams College in 1834, the society has chapters in 34 colleges and universities, with a membership of 8,000. It is an open, non-secret organization and owns 24 chapter houses. Among its prominent members are David Starr Jordan, Rossiter Johnson, W. H. P. Faunce, and Rev. Charles M. Sheldon.

Beta Theta Pi.— Founded at Miami University, Oxford, Ohio, in 1839, this was the pioneer society of the Middle West. It has a membership of 12,500, with 54 active chapters. The badge is a shield with 8 sides curved inward; the colors are light pink and blue. Among its prominent members are Foster L. Backus, Paul Wilcox, and W. R. Baird.

Chi Psi.— Founded at Union College, in 1841, this was the first Eastern society to establish chapters in the West, extending its organization to the Universities of Michigan and Minnesota. It had a membership in 1902 of 4,500 with 19 active chapters. The chapter house at Cornell is the finest fraternity house in this country. The society is more secret than most of its fellows. The badge is a jeweled monogram. Among its members are Willis J. Abbot, Francis M. Scott, and Allan Lee Smidt.

Delta Kappa Epsilon.— Founded at Yale College, New Haven, Conn., 22 June 1844, by 15 members of the junior class. The society has established 48 chapters and had a membership in 1902 of 13,548, being the strongest numerically of any college fraternity. Among prominent members of the society are President Roosevelt, John D. Long, Whitelaw Reid, Howard Gould, Julian Hawthorne, Cyrus C. Adams, John DeWitt Warner, M. G. Hyde, Julius Chambers, and G. R. Hawes.

Zeta Psi.— Founded at the New York University, 1 June 1847, this society established 21 chapters, and had a membership in 1902 of 5,330. The badge is a monogram; the color white, with which each chapter blends its college colors. Among prominent members are Augustus Van Wyck, Wm. Shrady, Harrison Grey Fiske, and H. W. Bookstaver.

Delta Psi.— Founded at Columbia College, New York, in Jan. 1847, has 11 chapters and a membership of 3,000. The badge of the society is a St. Anthony cross, bearing a shield of blue enamel. Among its prominent members are Thomas Nelson Page, W. Seward Webb, F. W. Vanderbilt, Brander Matthews, Wm. E. Curtis, and D. S. Appleton.

Theta Delta Chi.— Founded like several of its predecessors at Union College, this society was organized in 1848, and has 22 chapters and 4,000 members. The badge is a monogram; the colors black, white and blue. Among its members are John Hay, J. W. Griggs, H. H. Hanna, S. Fred Nixon, and Rev. David Gregg.

Phi Gamma Delta.— Founded at Jefferson College, Canonsburg, Pa., in May 1848, this society has established 57 chapters and has a membership of 8,753. The badge is a diamond-shaped shield on a field of black, bound by a golden cord; the color royal purple. Among its members are Gen. Lew Wallace, Edward Eggleston, S. S. McClure, Leigh H. Hunt, and R. Lloyd Jones.

Phi Delta Theta.— Founded at Miami University, Oxford, Ohio, 26 Dec. 1848, this society has established 68 chapters and has a membership of 12,000. The badge is a shield, bearing a scroll; the fraternity colors are argent and azure. Among its members are C. P. Bassett, Irving R. Bacon, C. P. Van Alen, and Rev. E. A. Dent.

Phi Kappa Sigma.— Founded at the University of Pennsylvania, 16 Aug. 1850, has established 15 chapters and has a membership of 1,000. The badge is a gold Maltese cross, with a skull and crossbone centre; the colors are old gold and black. Its membership includes H. C. King, J. R. Paxton, M. J. Asch, Geo. G. Battle, and Wm. McClure.

Phi Kappa Psi.— Founded at Jefferson College, Canonsburg, Pa., 19 Feb. 1852, has established 40 chapters and had, in 1902, over 8,000 members. The badge is a shield of gold; the colors pink and lavender. Prominent among its members are Henry T. Scudder, F. E. Hamlin, W. L. Stoddard and Thos. A. Nelson.

Chi Pi.— Founded at Hobart College, in Dec. 1854, has organized 19 chapters with a membership of 4,700. The fraternity was reorganized in 1896. The badge is a monogram. Geo. S. Hobart, H. C. Platt, F. A. Mandeville, and F. C. Weber are among its prominent members.

Sigma Chi.— Founded at Miami University, Oxford, Ohio, 20 June 1855, has organized 50 chapters and has 8,000 members. The badge is a cross of gold and white enamel; the colors are blue and gold. Among its members are Thos. Ewing, Jr., Wm. E. Quimby, H. W. Chatfield, and Henry A. Potter.

Sigma Alpha Epsilon.— Founded at the University of Alabama in 1856, has organized 59 chapters and has 7,000 members. Among its prominent members are Charles B. Harvey, F. K. Knowlton, T. W. Beach, and H. P. Nash.

Delta Tau Delta.— Founded at Bethany College in 1860, has organized 37 chapters and has a membership of 1,200. The colors are purple, gold and white.

Alpha Tau Omega.— Founded at the Virginia Military Institute, 11 Sept. 1865, has organized 45 chapters and has a membership of 6,000. Among its prominent members are Irving Bacheller, Hugh S. Thompson, E. B. Southworth and Walter H. Page.

Kappa Sigma.— Founded at the University of Virginia in 1867, has established 49 chapters and has a membership of 3,500. The badge is a crescent and star; the colors old gold, maroon and blue.

Sigma Nu.— Founded at the Virginia Military Institute, 1 Jan. 1869, has organized 46 chapters and has a membership of 5,000. The badge is designed after that of the Legion of Honor of France; the colors are black, white and gold.

Phi Sigma Kappa.— Founded at the Massachusetts Agricultural College, 15 March 1873, has organized 14 chapters and has a membership of 1,050. The colors of the society are silver and magenta. Among its members are Wm. H. Bishop, S. C. Thompson, J. W. Goff, Jr., and M. C. Valentine.

Among the Greek-letter Societies of women are the Alpha Chi Omega, Alpha Phi, Chi Omega, Delta Delta Delta, Delta Gamma, Kappa Alpha Theta, Kappa Kappa Gamma, and Pi Beta Phi. The Alpha Phi was founded in 1872, has 10 chapters and 1,100 members. The Delta Delta

Delta was founded in 1888, has 17 chapters and a membership of 1,000.

In October 1903 there was organized at the Indiana University the first negro Greek-letter society in the United States. It is known as the Alpha Kappa, with a charter membership of 10.

Greek Music, the theory and practice of melody and harmonics among the ancient inhabitants of Hellas. The subject of Greek music is an obscure and difficult one, but there are enough data extant to afford us a general idea of the Greek musical scale, of the use of instruments, and employment of the voice in solo and chorus among the Greeks. The earliest notion of music was derived from the necessity of keeping time in the dance. This at first would be effected by merely clapping the hands. The use of instruments of percussion would follow, and the drum and cymbal came into use. The cymbal originated in Egypt, and reached Greece as a permanent element in the practice of music. The rustle of the wind through the reeds, sometimes with a shrill whistling vibration, suggested the application of the human breath to hollow pipes, and what is still called the Pan's pipes was invented. Wind instruments of various kinds came afterwards into vogue, the flute, and the double flute were employed, and seem generally to have been blown as accompaniments to the elegy and the love song. These pipes were of various kinds and were considered as good accompaniments to the recitations of the poet, as well as for regulation of movement in a dance. They were employed in the ceremonies of the mysteries, and Plato speaks of an often recurring thought as resembling "the sound of the flute in the ear of the mystic."

Instrumental music attained its highest development in the invention of the lyre. The Egyptians attributed this invention to their god Thoth. In Greece Hermes is celebrated as the inventor of the lyre, which became henceforth the instrument of the epic poet and the rhapsode or reciter. It had originally four strings, which it is said were suggested by the tendons stretched over the shell of a tortoise. The first Greek philosopher to attempt a scientific theory of musical scales and intervals appears to have been that profound and versatile man Pythagoras (585 B.C.). The Greeks did not use the word music in application to the art which we so name. Music to them comprised everything which the Muses inspired, and even history and astronomy as well as poetry were music. What we mean by the term was called by the Greeks harmonics, which means the art of fitting, that is, adjusting the intervals in a scale, in the strings of a lyre. The scale of Pythagoras had seven notes, corresponding with the seven strings of his lyre, and he professed to derive his idea of music from the music of the spheres. The sun revolving round the earth was to him the chief planet, and was represented by the middle string of the lyre which was considered the key-note, corresponding with A in the modern scale. On one side were strings representing Mercury, Venus and the Moon, on the other side three more corresponding with Mars, Jupiter and Saturn. It is said that Pythagoras discovered the ratios of the perfect intervals from hearing blacksmiths striking an anvil with hammers of different weights. Aristoxenus (B.C. 300) discovered the difference between the major and minor tones and has been called "the father of temperament." Claudius Ptolemy (B.C. 150) demonstrated the musical axiom which obtains in modern times that the major tone should be below the minor.

The Greeks had four modes or scales, the Dorian, the Phrygian, the Lydian, and the Mito-Lydian. The Dorian was set in the key of F natural, and the rest were distinguished by analogous differences.

The ancient Greeks were passionately fond of music, and elaborate treatises were written by them on the science and art. They did not understand harmony, and Aristotle (384 B.C.) speaks of the only chorus singing known as that of men singing a melody an eighth lower than it was sung by boys, which of course would be unison. Music was employed at Athens by wandering epic minstrels; it was also common in religious ceremonies, and to regulate the movements of the army. It formed part of the drama. We are told that Æschylus, the father of tragedy, composed the music for his own dramas and that Sophocles accompanied on the lyre the performance of one of his plays.

Greek Philosophy, the various speculations of the ancient Greeks with regard to the origin of things. This is but a partial description of the intellectual efforts made by the keen and powerful minds of the ancient world to solve those problems which science now-a-days is so eagerly investigating. The origin of Greek philosophy was the gradual disbelief that had seized men's minds as to the truth of the ancient poetical cosmogonies, and antique mythologies of religion. Faith was dead and reason had awakened. In the 7th century before our era, in the flourishing city of Miletus, capital of the Ionian colony, the first Greek philosopher propounded the question which is still being put, What is the basic substratum of all phenomena? In our own days Huxley called it protoplasm; Herbert Spencer said it was force. Thales of Miletus (636 B.C.) declared it was water, which to him seemed to permeate and give life to all things. Thales was the first of the Greek physicists, or materialists, and was considered one of the Seven Wise Men of Greece. He was the founder of the Ionian School of Philosophy. He was succeeded in the long line of philosophical inquirers by Anaximenes (529 B.C.): who looking for the first element, the first cause, found it in air. Air was universal and must be the parent of all things. It was the breath of life and must therefore be the source of it. Diogenes of Apollonia (460 B.C.) fixed upon a higher notion as the first cause of things. He saw the ruling race of mankind prevailed over nature by their intelligence. He decided that intelligence was the cause and foundation of all things. In these speculations as to the nature of the universe and its origin we come upon two remarkable men, Anaximander of Miletus (610 B.C.) and Pythagoras, who invented the word philosophy. The former taught that all existence came from the infinite — a vague term, which did not mean the infinite intelligence but the infinite existence. Pythagoras said that number was the first thing, from which all else proceeded — a metaphysical abstraction, which almost defies analysis. Aristotle says the Pythagoreans "taught that number was the beginning of things, the cause of their mate-

rial existence, and of their modifications and different states."

The school of Eleatics is chiefly represented by the poet Xenophanes (620 B.C.). His philosophic creed is thus described by Aristotle: "Casting his eyes upward at the immensity of heaven, he declared that *The One* was God." Reason and imagination led this thinker to become at once a Monotheist and a Pantheist. Parmenides who was born (536 B.C.) at Elea, a city which gave its name to Eleatics, was the first to make the great distinction between truth and opinion, between the deductions of reason and the impressions of sense. He made being the basis of things, for non-being was impossible — a discovery which at that stage in philosophical speculation was of great importance. Zeno, another Eleatic, b. 500 B.C., who was the inventor of logic, was persecuted and put to death for free-thinking, and was a follower and disciple of Parmenides. Plato says that the master proved the existence of the one; the disciple established the non-existence of the many. He preserved his master's distinction between truth and opinion. "Your senses," he would say, "tell you that there are many things existing; reason avers that there is but one."

A contemporary of Zeno was a man who began at Ephesus those speculations as to the origin of the universe to which as preliminary he added a theory on the origin of knowledge. This was Heraclitus (503 B.C.). He was a disciple of Xenophanes, and taught that fire is the origin of everything, and there is no existence, but only change; things cannot be said to be, but only to be becoming; processes and not states formed the mode of existence. We cannot know or name anything with truth, for as we look at it, it changes, and is something different from what we thought it.

Anaxagoras came from Clazomenæ to Athens just when the age of Pericles was dawning; he had indeed Pericles, Euripides, and Socrates as his pupils. He attacked the patriotic religion of the proud city and was banished to Lampsacus. He thought that all sense — knowledge — was delusive until corrected by reason. He believed that intelligence was the creative and regulating influence of the universe. Things as they are were brought about by the concourse of infinite atoms; but these atoms were of all sorts, and that like was united to like in an infinite series of movement and combination; gold by the union of gold atoms that had existed from eternity, fires from fire atoms, air from atoms of air. These atoms were the famous homœomeriæ spoken of and condemned by Aristotle. Empedocles (444 B.C.) was of the great city of Agrigentum; in his views of knowledge he belonged to the Eleatics, and maintained that the senses were fallible, while reason was a sure guide to truth. He was a poet and declaimed against anthropomorphic ideas of deity. He gathered in one the doctrines of the Ionian physicists declaring the primary elements were four, namely, earth, air, fire and water. Love was the formative principle of things, hate the dissolver and destroyer. One was harmony, the other discord, and God is the One, "a sphere fixed in the bosom of harmony, rejoicing in calm rest."

Democritus of Abdera (460 B.C.) was a rich man who entertained Xerxes at his house. He went one step further than Anaxagoras, and almost entered the circle of our modern science by teaching the atomic theory, namely that everything in the world is the result of a fortuitous concourse of atoms, all of the same substance, but making various things through the various forms they take in uniting. Color, sweetness, cold, are the result not of substances essentially differing; all is form.

All attempts had so far failed to solve the problems of the material world, and of human knowledge. Many theories were put forth, none were universally accepted, although they were each discussed. This brought the Sophists on to the stage of philosophy — men who taught the arts of discussion, not of investigation. One of the greatest of them was Protagoras. He was a disciple of Democritus, and taught that opinion was everything, "Man, the individual man, each for himself, is the measure of all things." The Sophists were the first skeptics, but a new epoch rose with Socrates (469 B.C.). He was the most remarkable man in all the Greek world; for his love of disputation he was classed by some with the Sophists, for his ridicule of traditional views in religion and physics, he was condemned to death — yet he succeeded in substituting morals for physics as the subject of philosophy. He first gave to philosophical methods the definition and the inductive argument, or reasoning by analogy. One of his disciples, Aristippus of Cyrene, while he followed the method of his master, founded the Cyrenaic school which taught that pleasure was the criterion of the true: Socrates had taught that the good as judged by the individual conscience was that criterion. Then followed the Cynics, under Antisthenes, who went to the opposite extreme to Aristippus, became an ostentatious ascetic, and in this was followed by Diogenes of Sinope, who made his home in a cask or tun, and tried to set the example of a rugged virtue, which is misanthropic, but triumphant over bodily appetite. It was left to Plato to exhibit the complete adoption and application of the Socratic method. He believed that in each man resided the power of detecting the truth, from having seen the perfection of things, in an ideal world during a previous state of existence; he could judge of the good and the beautiful here from his memory of what their perfect archetypes were. His voluminous writings enable us to judge both of his ethical and political system, but they both fail in practicality. His most famous pupil was Aristotle (384 B.C.), a man of encyclopedic mind, the first scientific observer, the inventor of the syllogism. Plato was an idealist and a rationalist; Aristotle a materialist and an empiric. The one trusted to reason, the other to experience. Aristotle always argued against the ideal theory of his master, and deduced his conclusions from things as he saw them. He invented grammar as well as logic, and was in himself an epitome of the philosophic learning of his predecessors. But by reasoning from experience he had opened the way for the skeptics, of whom the first was Pyrrho, who taught that there is no criterion of truth. Phenomena are mere appearances, how can we prove they are anything else? This was what in modern times is called agnosticism, for we cannot prove and therefore cannot know the truth of anything we see. But after this suicide of philosophy in the school of Pyrrho, she revived again as a moral mentor in the person of Epi-

curus, of Samos (342 B.C.). He taught the highest good is pleasure; this is the moral end of existence. He was controverted by the Stoics. Zeno was their leader, a man of stern unbending character and abstemious life, whose aim was to show that virtue consisted in manhood, and manhood in the power to endure hardness and to despise the body. Skepticism, indifference, sensuality and epicurean softness were not to be combated by the vague dreams of Plato, or the cumbrous system of Aristotle. The Stoic attempted to meet the growing decadence by an exactly opposite self-denial and impassive reserve. But Stoicism was egotistic; its aim was the repression of feeling, it was apathy, death in life. The last struggle of Greek philosophy to dominate the mind of society was witnessed in the rise of the New Platonists and their New Academy. Carneades (213 B.C.) was their most illustrious representative, and he was the type of a school that took up the doctrines of Plato, expanded and enlarged them until the time when Christianity appeared, and faith, not reason, as in the old days seven hundred years before, dominated the world of opinion. See PHILOSOPHY, HISTORY OF.

Greek Theatre, First in America, the gift of William R. Hearst to the University of California, is exactly similar in its proportions to the famous theatre of Dionysus at Athens.

The structure was used for the first time at the University of California commencement 1903 when President Roosevelt was the orator of the day. It was then learned that every one of the 8,000 spectators seated in the theatre could hear with perfect distinctness.

No roof shuts out the sunlight or starlight from the audience. Situated right in the heart of magnificent scenery, tall trees towering up above the walls on all sides and the building itself being an architectural gem, it will readily be seen that very little stage scenery will be needed when presenting the early plays which will be given by university students and the leading actors of the world as soon as all is ready.

The entire structure is white; the hangings will be a blending of the Greek and Roman colors; but there will be very few decorations used aside from architectural carvings, the splendor of the place being in its dimensions and simplicity.

Though this theatre is modeled in a general way after the ancient classic buildings of a similar character, no single historic example has been literally followed. The theatre at Epidaurus, in Greece, however, offers many points of similarity, notably in the difference of slope between the upper tiers of seats and the inner and lower portions of the auditorium. The new theatre is of approximately the same size as the larger theatre at Pompeii.

The building is, as a whole, made up of two separate and distinct parts, namely, the stage, corresponding to the ancient logeion, and the auditorium.

The floor of the stage is 133 feet wide and 28 feet deep. It is entirely open toward the auditorium and surrounded on the other three sides by a wall 42 feet in height. This wall, which corresponds with the ancient skene, is enriched by a complete classic order of Greek Doric columns with stylobate and entablature, the ends of the side walls toward the auditorium forming two massive pylons. Five openings pierce the wall, the entrance in the centre of the back of the stage being the most important — the so-called royal door of the ancients. This is flanked by two minor doors to the right and left, the two remaining openings occurring on the return walls at either end of the stage.

The auditorium or theatre proper is semicircular in form, 254 feet in diameter, and is divided into two concentric series or tiers of seats. The first series is arranged about a level circle 50 feet in diameter and 5½ feet below the stage, which corresponds to the space anciently devoted to the chorus, orchestra, etc.

From this circle the receding rows of seats step up gradually until the stage level is reached at a circle corresponding in diameter with the terminal pylons of the stage wall. This line is marked architecturally by a passage, anciently named the diazoma or diodos, running around the semicircle of seats midway between the orchestra and the topmost circle. The diazoma is protected on its outer side by a wall, beyond which the seats step up more steeply, approximately at an angle of 30 degrees with the horizontal, to the outer limit of the theatre.

It is estimated that more than 7,000 persons can be seated in the theatre proper. The stage will accommodate some 600 more, a number which can be readily added to by the temporary extension of the stage floor toward the auditorium.

Greeley, Horace, American journalist: b. Amherst, N. H., 3 Feb. 1811; d. Pleasantville, N. Y., 29 Nov. 1872. More than 30 years after his death, Horace Greeley's name remains at the head of the roll of American journalists. Successors in the primacy of current discussion may surpass him, as doubtless some of them already have, in consistency and learning, but hardly in the chief essentials of a journalistic style; others may exert a more salutary influence, if not so personally diffused: but in the respect of high ideals, courage, intellectual force, and personal magnetism, the qualities which impel a man of letters to be also a man of action, Horace Greeley was of heroic mold. He was no pop-gun journalist firing from a sky-sanctum, but a face-to-face champion in the arena of public affairs, laying about him with pen and speech like an ancient Bayard with his sword. The battles he fought for humanity, and the blows he gave and received, have made him for all time the epic figure of the American press.

Born in rural New Hampshire, of English and Scotch-Irish descent, he epitomized his heritage and his attainment in the dedication of his autobiography "To our American boys, who, born in poverty, cradled in obscurity, and early called from school to rugged labor, are seeking to convert obstacle into opportunity, and wrest achievement from difficulty."

Though physically a weak child, his intellect was strong, and when near his tenth year his father removed to Vermont, the boy took with him the reputation of a mental prodigy; so, with little schooling and much reading, he was thought when 14 to be a fit apprentice to a printer, setting forth four years later as a journeyman. His parents had moved to western Pennsylvania, and he followed; but after a desultory practice of his art he came to the metropolis on August 17, 1831, with $10 in his pocket, and so rustic in dress and manners as to fall under suspicion of being a runaway apprentice. Later

in life, at least, his face and his figure would have lent distinction to the utmost elegance of style: but his dress was so careless even after the long period of comparative poverty was passed, that the peculiarity became one of his distinguishing features as a public character; and to the last there were friends of little discernment who thought this eccentricity was studied affectation: but manifestly his dress, like his unkempt handwriting was the unconscious expression of a spirit so concentrated on the intellectual interests of its life as to be oblivious to mere appearances.

After 18 months of dubious success in New York as a journeyman, in his 21st year, he joined a friend in setting up a modest printing-office, which on March 22, 1834, issued the 'New Yorker,' a literary weekly in the general style of Willis' 'Mirror,' under the firm name of H. Greeley & Company. For four years the young printer showed his editorial aptitude to such good effect that in 1838 he was asked to conduct the 'Jeffersonian,' a Whig campaign paper. This was so effective that in 1840 he was encouraged to edit and publish the 'Log-Cabin,' a weekly which gained a circulation of 80,000, brought him a reputation as a political writer, and active participation in politics with the Whig leaders, Gov. Seward and Thurlow Weed. It contributed much to the election of Gen. Harrison, but very little to the purse of the ambitious editor. On April 10 of the following year, 1841, he issued the first number of the New York *Tribune*, as a Whig daily of independent spirit. He was still editing the 'New-Yorker' and the 'Log-Cabin,' both of which were soon discontinued, the 'Weekly Tribune' in a way taking their place. Though the 'New-Yorker' had brought him literary reputation, it had not been profitable, because of uncollectible bills which at the end amounted to $10,000. Still, at the outset of the *Tribune* he was able to count $2,000 to his credit in cash and material. He was then 30 years of age, and for 30 years thereafter the paper grew steadily in circulation, influence, and profit, until, a few weeks after his death, a sale of the majority interest indicated that the "good-will" of the *Tribune*, aside from its material and real estate, was held to be worth about a million dollars. The Greeley interest was then small, since he had parted with most of it to sustain his generous methods of giving and lending.

He had great capacity for literary work, and when absent for travel or business was a copious contributor to his paper. To his rather delicate physical habit was perhaps due his distaste for all stimulants, alcoholic or otherwise, and his adherence through life to the vegetarian doctrines of Dr. Graham; another follower of the latter being his wife, Mary Young Cheney, also a writer, whom he married in 1836. His moderate advocacy of temperance in food and drink, coupled with his then unorthodox denial of eternal punishment, helped to identify him in the public mind with most of the "isms" of the time, including Fourierism and spiritualism; when in fact his mind and his paper were merely open to free inquiry, and were active in exposing vagaries of opinion wherever manifested. Protection to American industry, and abolitionism, were the only varieties which he accepted without qualification; and while the pro-slavery party detested him as a dangerous agitator, it is possible at this day even from their point of view to admire the moderation, the candor, and the gentle humanity of his treatment of the slavery question. In all issues concerning the practical affairs of life, like marriage and divorce, he was guided by rare common-sense, and usually his arguments were scholarly and moderate; but in matters of personal controversy he was distinctly human, uniting with a taste for the intellectual fray a command of facts, and a force and pungency of presentation, which never seem admirable in an opponent.

He was in great demand as a lecturer and as a speaker at agricultural fairs, his addresses always being distinguished by a desire to be helpful to working humanity and by elevated motives. Though not a jester, genial humor and intellectual exchange were characteristic of his social intercourse. His books, with one or two exceptions, were collections of his addresses and newspaper articles. His first book, 'Hints Toward Reforms,' appeared in 1850, and was followed by: 'Glances at Europe' (1851); 'A History of the Struggle for Slavery Extension or Restriction' (1856); 'The Overland Journey to California' (1859); 'An Address on Success in Business' (1867); 'Recollections of a Busy Life,' formed on a series of articles in the New York 'Ledger' (1869); 'Essays Designed to Elucidate the Science of Political Economy' (1870); 'Letters from Texas and the Lower Mississippi, and an Address to the Farmers of Texas' (1871); 'What I Know of Farming' (1871); and 'The American Conflict,' written as a book, the first volume appearing in 1864 and the second in 1867. This work on the Civil War is remarkable, when considered in the light of his purpose to show "the inevitable sequence whereby ideas proved the germ of events"; but it was hastily prepared, and while strikingly accurate in the large sense, will not bear scrutiny in some of the minor details of war history.

Neither his political friends, nor his party, nor the causes he espoused, could hold him to a course of partisan loyalty contrary to his own convictions of right and duty. As a member of the Seward-Weed-Greeley "triumvirate," he was often a thorn in the flesh of the senior members; his letter of Nov. 11, 1854, dissolving "the political firm," being one of the frankest documents in the history of American politics. During the Civil War he occasionally embarrassed Mr. Lincoln's administration by what seemed then to be untimely cries of "On to Richmond!" immediate emancipation, and peace. On the whole, his influence for the Union cause was powerful; but when, the War being over, he advocated general amnesty, and finally as an object lesson went on the bail bond of Jefferson Davis, he lost the support of a large body of his most ardent anti-slavery admirers. The clamor against him called forth a characteristic defiance in his letter to members of the Union League Club, who were seeking to discipline him. Having further alienated the Republican party by his general attitude in "reconstruction" matters, he became the logical candidate for the Presidency, in 1872, of the Democrats at Baltimore and the Liberal Republicans at Cincinnati, in opposition to a second term for Gen. Grant. Though personally he made a brilliant canvass,

the influences at work in his favor were inharmonious and disintegrating, and the result was a most humiliating defeat. This he appeared to bear with mental buoyancy, despite the affliction of his wife's death, which occurred a week before the election, he having left the stump in September to watch unremittingly at her bedside. On November 6, the day after his defeat, he resumed the editorship of the *Tribune*, which six months before he had relinquished to Whitelaw Reid. Thereafter he contributed to only four issues of the paper, for the strain of his domestic and political misfortunes had aggravated his tendency to insomnia; on the 12th he was seriously ill, and on the 29th he succumbed to inflammation of the brain. The last few months of his eventful career supplied most of the elements essential to a Greek tragedy. On December 23, the *Tribune* having been reorganized, with Mr. Reid in permanent control, there first appeared at the head of the editorial page the line "Founded by Horace Greeley," as a memorial to the great journalist and reformer. A bronze statue has been erected in the portal of the new *Tribune* office, and another statue in the angle made by Broadway and Sixth Avenue, appropriately named "Greeley Square," after the man who was second to no other citizen in establishing the intellectual ascendency of the metropolis. CLARENCE CLOUGH BUEL.

Greeley, Colo., city, county-seat of Weld County; on the Cache la Poudre River, the Union P. and the C. & S. Railroads; about 50 miles north of Denver. The place was settled in 1870 by the "Greeley Colony" (named after Horace Greeley), made up mainly of New England people. By irrigation they have made of the almost barren region an excellent agricultural country. It is the seat of a State Normal School. The chief manufactures are flour, beet-sugar, and lumber. Its trade is in its manufactured articles, also sheep, cattle, grain, and vegetables. Pop. (1900) 3,023.

Greely, Adolphus Washington, American Arctic explorer: b. Newburyport, Mass., 27 March 1844. After receiving a high school education he enlisted as a private in the 19th Massachusetts volunteer infantry, serving in the Civil War from 1861 to 1865. He entered the regular army in 1867 as second lieutenant and was appointed to the signal service. In 1881 he was put in command of an Arctic expedition, organized to carry out the plan of establishing circumpolar stations in accordance with the recommendations of the International Geographical Congress held at Hamburg in 1879. The exploring party made their headquarters for two years at Discovery Harbor, Grinnell Land. In an expedition made by a detailed party, the highest point north attained up to that date, 83° 24′, was reached. On his way back he reached Cape Sabine with great difficulty, and during the winter of 1883 lost, through cold and famine, all but seven of his twenty-five companions. Meanwhile Com. Winfield S. Schley had been despatched on a relief expedition, and in June 1884 rescued them at Cape Sabine. From his services to geographical science Lieutenant Greely was awarded the Founder's Medal of the Royal Geographical Society, and the Roquette Medal by the Société de Géographie of Paris. He was promoted to the rank of captain in the United States Army, and in 1887 succeeded Gen. W. B. Hazen as chief signal officer, with the rank of brigadier-general. Consult: Greely, 'Three Years of Arctic Service' (1886); Schley, 'The Rescue of Greely' (1885).

Green, Alice Sophia Amelia (STOPFORD), English historian: b. Kells, Ireland, 1849. She was privately educated. In 1877 she was married to J. R. Green (q.v.) the well-known historian. She collaborated with him in 'A Short Geography of the British Islands' (1879), edited his 'Conquest of England' (1883), prepared a revised edition (1888) and, with Miss K. Norgate, a finely illustrated edition (1892) of the 'Short History of the English People.' Her original works are 'Henry II.' (1888) and 'Town Life in the Fifteenth Century' (1894).

Green, Andrew Haswell, American lawyer: b. Worcester, Mass., 6 Oct. 1820; d. 13 Nov. 1903. He studied law, practised his profession in New York, and was there president of the board of commissioners of education, and comptroller (1871–6). In the latter capacity he re-established the municipal credit, seriously impaired by the embezzlements of the Tweed ring. He originated in 1868 the plan for Greater New York, executed in 1897, and also devised the plan for the consolidation of the Astor, Lenox, and Tilden foundations as the New York Public Library. He also assisted in establishing the American Museum of Natural History and the Metropolitan Museum of Art, and founded and became president of the New York Zoological Society. He was shot by Cornelius M. Williams, a negro, pronounced insane. It developed that he lost his life through resemblance to another against whom the assassin had a supposed grievance.

Green, Anna Katharine. See ROHLFS, ANNA K. G.

Green, Ashbel, American Presbyterian clergyman: b. 6 July 1762; d. 19 May 1848. He was graduated from the College of New Jersey (now Princeton University) in 1783, and appointed tutor and subsequently professor of mathematics and natural philosophy in that institution, which latter position he held for a year and a half. In 1786 he was licensed to preach and took up ministerial work in Philadelphia. From 1792 to 1800 he was chaplain to Congress, and in 1809 took a prominent part in forming the Philadelphia Bible Society, the earliest institution of the kind in the United States. He drafted the constitution of the Princeton theological seminary, of which he was one of the originators, and in 1812 was elected president of Princeton College. In 1822 he resigned this office and returned to Philadelphia to edit the 'Christian Advocate,' a religious monthly. For half a century he was one of the leading men in the Presbyterian Church. Among his many writings are 'Discourse Delivered in the College of New Jersey, with a History of the College' (1822); 'History of Presbyterian Missions'; 'Lectures on the Shorter Catechism.'

Green, Bartholomew, American publisher: b. Cambridge, Mass., 1666; d. 1732. He published the first newspaper that appeared in the American colonies, and succeeding to his father's business at Cambridge extended it at Boston, where the office of the 'Boston News Letter' was situated. The proprietor and editor was John Campbell, postmaster of Boston. He event-

ually bought in the paper, which became notable for outspokenness on topics of religion and politics.

Green, Beriah, American abolitionist: b. New York State 1794; d. 1874. He was educated at Middlebury College, Vermont, became professor of sacred literature in Western Reserve College in 1821, but was compelled to resign in a few months through the opposition aroused by his anti-slavery views. He was for many years president of the Oneida Institute, Ohio. He was a great friend of William Lloyd Garrison, and exerted a wide influence in abolitionist circles. Among his writings are 'History of the Quakers' (1823).

Green, Duff, American politician and journalist: b. Woodford County, Ky., 1791; d. Dalton, Ga., 1875. He served with the Kentucky militia in the War of 1812; after the admission of Missouri as a State was appointed State Senator (1823), and became editor and proprietor of the St. Louis *Enquirer*. In 1825 he removed to Washington, D. C., where he purchased the United States *Telegraph*. This became the administration organ, and Green rose to high favor with President Jackson. He was a member of the "Kitchen Cabinet." After the rupture between Calhoun and Jackson, the *Telegraph* as the organ of the nullificationists bitterly attacked Jackson. After some years spent in Europe he returned to the United States (1844) and edited a short-lived newspaper in New York. During the latter years of his life he was actively engaged in promoting the development of the South, and was one of the founders of the town of Dalton, Ga.

Green, Hetty Howland Robinson, American financier: b. New Bedford, Mass. 21 Nov. 1835. She is the richest woman in America and probably the boldest and ablest woman financier of her time. Although she has an interest in nearly every large corporation and important enterprise in the world, she manages personally her own property in stocks, bonds, and real estate in Chicago, New York, and elsewhere.

Green, Jacob, American Presbyterian clergyman: b. Malden, Mass., 1722; d. 1796. He became president of the College of New Jersey in 1757, and in 1775, as a member of the New Jersey Provincial Congress, was chairman of the committee chosen to prepare a State Constitution. He suggested in print a scheme for the redemption of the Continental currency, closely resembling that which Congress later adopted.

Green, John Cleve, American merchant and philanthropist: b. Lawrenceville, Mercer County, N. J., 14 April 1800; d. New York 28 April 1875. He entered a counting-house in New York, went as supercargo to South America and China, and in 1833 became a member of the firm of Russell & Co. at Canton. In 1839 he returned to New York, where he continued in the Chinese trade. For many years he was a director of the Chamber of Commerce, and officially connected with numerous public and charitable institutions. He was liberal in his gifts, particularly to New York University, and Princeton University. At Princeton he established (1873) the John C. Green School of Science by the gift of $50,000, subsequently increased by the residuary legatees. In this school instruction is given in general science, civil engineering, and electrical engineering. The courses are four years in length and lead to the degrees of bachelor of science, civil engineer and master of science. In 1902–3 the number of students in this department was 505. The endowed proprietary school for boys at Lawrenceville, N. J. was re-established in 1882 upon a gift from the executors of his estate known as 'The John C. Green Foundation.'

Green, John Richard, English historian: b. Oxford 1837; d. Mentone, France, 7 May 1883. He was graduated in 1859 from Jesus College, Oxford, where, since the study of modern history had not yet taken any considerable place in the university, the officers failed of sympathy with his preference for Matthew Paris to the classics. In 1860 he was ordained deacon and became curate of St. Barnabas, London, in 1863 was appointed to Holy Trinity, Hoxton, and in 1866 to St. Philip's, Stepney. Failing health and increasingly liberal views caused him to withdraw from clerical life, and from 1869 he was librarian at Lambeth. His first literary work of importance consisted of articles, especially brief essays, on historical subjects, in the 'Saturday Review.' In 1874, after having been twice rewritten, his 'Short History of the English People' appeared. This work unified English history as no other had yet done. 'What Macaulay had done for a period of English history,' says Creighton, 'Green did for it as a whole.' Green's purpose was to exhibit the development of popular life by a description of the leading manifestations of social progress. The book was skilful in arrangement and artistic in style, and met with an instant and large success. The author expanded it into his 'History of the English People' (1877–80), not only to secure greater fulness but also to defend views merely stated in the smaller work. He then attempted a history for scholars, of which but two parts were published — 'The Making of England' (1882), which extends from Britain as left by the Romans to the consolidation under Egbert, and secured his fame as a critical historian, particularly through his method of employing archæology for the purposes of history; and 'The Conquest of England' (1883), which continued the narrative to the arrival of the Normans. Green's influence on historical studies in England was very great, and his 'Short History' and 'History' still hold a foremost rank. The Oxford Historical Society and the 'English Historical Review' were originally suggested by him; and he further published: 'Stray Studies in England and Italy' (1876), a reprint of early papers; 'Readings from English History' (1879), a series of extracts; 'A Short Geography of the British Isles' (1880); and an edition of Addison's 'Essays' (1881). His 'Letters' were published in 1901.

Green, Joseph, American poet: b. Boston, Mass., 1706; d. London, England, 11 Dec. 1780. He was graduated at Harvard 1726, and was famous for his wit and satirical powers. During the War of the Revolution he was prominent on the Loyalist side. His works include: 'The Wonderful Lament of Old Mr. Tenor' (1744); 'Poems and Satires' (1780).

Green, Seth, American pisciculturist: b. Irondequoit, N. Y., 19 March 1817; d. Rochester, N. Y., 20 Aug. 1888. He learned the natural history necessary for his profession from observation and private reading, and began his

life's work by the artificial hatching of trout roe. He was looked upon as the leading expert in this department of fish culture, but his first great triumph in new fields came with his success in the reproduction of shad. The Seth Green shad-hatching box was invented in 1867, and, although it has been superseded, by this device shad culture was first demonstrated to be possible and its inventor must be looked upon as the pioneer in this difficult department of pisciculture. The Connecticut River was restocked by means of this invention. In 1868 he was made fish commissioner for the State of New York, and the following year undertook the artificial reproduction of whitefish. He was successful in his experiments, and was acknowledged as one of the fathers of fish culture in the United States. From 1870 until his death he was superintendent of the state hatchery at Caledonia, N. Y.

Green, Thomas Hill, English philosopher: b. Birkin, Yorkshire, 7 April 1836; d. Oxford, 15 March 1882. He was educated at Rugby and Oxford; was elected fellow at Balliol in 1862, the first lay tutor on that foundation (1867), and in 1878 Whyte professor of moral philosophy in the university. His principal work as a philosopher was the foundation of the so-called Neo-Hegelian School. He is supposed to have been taken by Mrs. Ward as a model for her Mr. Gray in 'Robert Elsmere'; but the resemblance is by no means complete, as Mr. Gray's work is undoubtedly, as he appears in 'Robert Elsmere,' rather that of a destructive literary critic than a constructive philosopher. His works include: 'Introduction to Hume's Treatise of Human Nature' (1874); and 'Prolegomena to Ethics' (1883.)

Green Bay, Wis., a city and county-seat of Brown County, situated at the head or southern point of the bay of the same name, and at the mouth of the Fox River, on the Chicago & Northwestern, Chicago, Milwaukee & St. Paul, the Green Bay & Western R. R.'s.

Commerce and Industry.— Green Bay has an extensive commerce. Twenty-four passenger trains arrive daily over the four railroads entering the city. An extensive lake traffic is also carried on, the harbor, through government appropriations, having been made accessible to the largest vessels upon the Great Lakes. Coal constitutes the largest single import, Green Bay being an advantageous distributing point. The largest export by way of the lakes is grain, although much lumber has hitherto been shipped out. A line of excursion steamers is also run to nearby summer resorts and to Mackinac and the "Soo." The city is provided with a complete electric railway system, including an interurban line up the Fox River valley to Kaukauna, where a junction is made with another electric line passing through Appleton, Neenah, Oshkosh and Fond du Lac. A light and power plant furnishes gas for lighting and heating and electricity for light and power, many electric motors now being in use. There are a number of manufacturing plants — 3 large breweries, 2 paper mills and 1 sulphite mill, 2 large saw mills, 2 planing mills, 1 very large canning factory, 1 shoe factory, 1 glove factory, 1 pure milk factory, 1 furniture factory, 2 woodenware factories, 3 machine shops, 1 candy and biscuit factory, 1 pickle factory, 1 coffin factory, 1 carriage factory, 1 cornice factory, 1 paper-box factory. Several jobbing and wholesale houses do a large business, the most important being a grocery house, a hardware house, and a crockery house. An extensive fish-shipping business is also carried on. Water is supplied from artesian wells by a private company.

Educational Institutions, Etc.— Green Bay has a number of fine public buildings, the Kellogg library, the Federal Buildings, Saint Joseph's Academy, three Hospitals, and just outside the city limits the State Reform School. The public school system consists of 2 high schools and 13 ward schools, employing 84 teachers. There are also several parish schools, graded in the same manner as the public schools. There are 6 Roman Catholic churches, 2 Baptist 2 Congregational, 1 Episcopal, 2 Evangelical, 2 Lutheran, 4 Methodist, 2 Moravian, 2 Presbyterian, and 1 Christian Scientist.

History.— Green Bay, the oldest town in Wisconsin, was first visited in 1634 by Jean Nicollet, who had been sent by Champlain, governor of New France, to find the rumored short route to China. The site was a favorable one for an Indian village as well as a landing place for explorers and missionaries. It is known that Marquette, Joliet, Allouez, and Tonti spent considerable time here. The town was therefore settled by the French, who impressed their character upon it for over 200 years, although it fell into the hands of the English at the close of the French and Indian war in 1763. In 1816 the Americans established a fort on the opposite side of the river, known as Fort Howard, around which a prosperous town of the same name grew up. In 1895 Fort Howard was annexed to Green Bay, and is now known as the West-Side.

Government, Etc.— The government of the city is administered by a mayor and common council, the latter consisting of sixteen members, elected for two years, two from each ward. Assessed valuation: Lots exclusive of buildings, \$4,150,235; buildings, \$4,279,740; personal property, \$2,827,140; total, \$11,257,115. Pop. (1903 est.) 20,142.

A. W. Burton,
Superintendent of Schools.

Green Bay, an arm of Lake Michigan, on the southwestern coast of the upper peninsula of Michigan and the eastern coast of Wisconsin. It is 120 miles long, from 10 to 20 miles wide, has an average depth of about 100 feet. Fox River, the outlet of Lake Winnebago, enters the bay at its head, at the city of Green Bay. The bay is navigable for the largest lake steamers. The largest cities on the bay are Green Bay and Marinette, in Wisconsin, and Menominee and Escanaba in Michigan.

Green Cove Springs, Fla., town, county-seat of Clay County; on the St. John's River, the Jacksonville, T. & K. W. railroad. It contains a warm sulphur spring noted for its medicinal properties. The trade is chiefly in fruits, vegetables, and lumber. Pop. 1,015.

Green Island, N. Y., a village of Albany County, on an island in the Hudson River opposite Troy, on the Delaware & H. and the New York C. & H. R. R.R.'s. It is connected with Watervliet and Troy by bridges; and has iron manufactories, machine shops and railroad car shops. Pop. (1900) 4,770.

ually bought in the paper, which became notable for outspokenness on topics of religion and politics.

Green, Beriah, American abolitionist: b. New York State 1794; d. 1874. He was educated at Middlebury College, Vermont, became professor of sacred literature in Western Reserve College in 1821, but was compelled to resign in a few months through the opposition aroused by his anti-slavery views. He was for many years president of the Oneida Institute, Ohio. He was a great friend of William Lloyd Garrison, and exerted a wide influence in abolitionist circles. Among his writings are 'History of the Quakers' (1823).

Green, Duff, American politician and journalist: b. Woodford County, Ky., 1791; d. Dalton, Ga., 1875. He served with the Kentucky militia in the War of 1812; after the admission of Missouri as a State was appointed State Senator (1823), and became editor and proprietor of the St. Louis *Enquirer*. In 1825 he removed to Washington, D. C., where he purchased the United States *Telegraph*. This became the administration organ, and Green rose to high favor with President Jackson. He was a member of the "Kitchen Cabinet." After the rupture between Calhoun and Jackson, the *Telegraph* as the organ of the nullificationists bitterly attacked Jackson. After some years spent in Europe he returned to the United States (1844) and edited a short-lived newspaper in New York. During the latter years of his life he was actively engaged in promoting the development of the South, and was one of the founders of the town of Dalton, Ga.

Green, Hetty Howland Robinson, American financier: b. New Bedford, Mass., 21 Nov. 1835. She is the richest woman in America and probably the boldest and ablest woman financier of her time. Although she has an interest in nearly every large corporation and important enterprise in the world, she manages personally her own property in stocks, bonds, and real estate in Chicago, New York, and elsewhere.

Green, Jacob, American Presbyterian clergyman: b. Malden, Mass., 1722; d. 1796. He became president of the College of New Jersey in 1757, and in 1775, as a member of the New Jersey Provincial Congress, was chairman of the committee chosen to prepare a State Constitution. He suggested in print a scheme for the redemption of the Continental currency, closely resembling that which Congress later adopted.

Green, John Cleve, American merchant and philanthropist: b. Lawrenceville, Mercer County, N. J., 14 April 1800; d. New York 28 April 1875. He entered a counting-house in New York, went as supercargo to South America and China, and in 1833 became a member of the firm of Russell & Co. at Canton. In 1839 he returned to New York, where he continued in the Chinese trade. For many years he was a director of the Chamber of Commerce, and officially connected with numerous public and charitable institutions. He was liberal in his gifts, particularly to New York University, and Princeton University. At Princeton he established (1873) the John C. Green School of Science by the gift of $50,000, subsequently increased by the residuary legatees. In this school instruction is given in general science, civil engineering, and electrical engineering. The courses are four years in length and lead to the degrees of bachelor of science, civil engineer and master of science. In 1902–3 the number of students in this department was 505. The endowed proprietary school for boys at Lawrenceville, N. J. was re-established in 1882 upon a gift from the executors of his estate known as 'The John C. Green Foundation.'

Green, John Richard, English historian: b. Oxford 1837; d. Mentone, France, 7 May 1883. He was graduated in 1859 from Jesus College, Oxford, where, since the study of modern history had not yet taken any considerable place in the university, the officers failed of sympathy with his preference for Matthew Paris to the classics. In 1860 he was ordained deacon and became curate of St. Barnabas, London, in 1863 was appointed to Holy Trinity, Hoxton, and in 1866 to St. Philip's, Stepney. Failing health and increasingly liberal views caused him to withdraw from clerical life, and from 1869 he was librarian at Lambeth. His first literary work of importance consisted of articles, especially brief essays, on historical subjects, in the 'Saturday Review.' In 1874, after having been twice rewritten, his 'Short History of the English People' appeared. This work unified English history as no other had yet done. 'What Macaulay had done for a period of English history,' says Creighton, 'Green did for it as a whole.' Green's purpose was to exhibit the development of popular life by a description of the leading manifestations of social progress. The book was skilful in arrangement and artistic in style, and met with an instant and large success. The author expanded it into his 'History of the English People' (1877–80), not only to secure greater fulness but also to defend views merely stated in the smaller work. He then attempted a history for scholars, of which but two parts were published — 'The Making of England' (1882), which extends from Britain as left by the Romans to the consolidation under Egbert, and secured his fame as a critical historian, particularly through his method of employing archæology for the purposes of history; and 'The Conquest of England' (1883), which continued the narrative to the arrival of the Normans. Green's influence on historical studies in England was very great, and his 'Short History' and 'History' still hold a foremost rank. The Oxford Historical Society and the 'English Historical Review' were originally suggested by him; and he further published: 'Stray Studies in England and Italy' (1876), a reprint of early papers; 'Readings from English History' (1879), a series of extracts; 'A Short Geography of the British Isles' (1880); and an edition of Addison's 'Essays' (1881). His 'Letters' were published in 1901.

Green, Joseph, American poet: b. Boston, Mass., 1706; d. London, England, 11 Dec. 1780. He was graduated at Harvard 1726, and was famous for his wit and satirical powers. During the War of the Revolution he was prominent on the Loyalist side. His works include: 'The Wonderful Lament of Old Mr. Tenor' (1744); 'Poems and Satires' (1780).

Green, Seth, American pisciculturist: b. Irondequoit, N. Y., 19 March 1817; d. Rochester, N. Y., 20 Aug. 1888. He learned the natural history necessary for his profession from observation and private reading, and began his

life's work by the artificial hatching of trout roe. He was looked upon as the leading expert in this department of fish culture, but his first great triumph in new fields came with his success in the reproduction of shad. The Seth Green shad-hatching box was invented in 1867, and, although it has been superseded, by this device shad culture was first demonstrated to be possible and its inventor must be looked upon as the pioneer in this difficult department of pisciculture. The Connecticut River was restocked by means of this invention. In 1868 he was made fish commissioner for the State of New York, and the following year undertook the artificial reproduction of whitefish. He was successful in his experiments, and was acknowledged as one of the fathers of fish culture in the United States. From 1870 until his death he was superintendent of the state hatchery at Caledonia, N. Y.

Green, Thomas Hill, English philosopher: b. Birkin, Yorkshire, 7 April 1836; d. Oxford, 15 March 1882. He was educated at Rugby and Oxford; was elected fellow at Balliol in 1862, the first lay tutor on that foundation (1867), and in 1878 Whyte professor of moral philosophy in the university. His principal work as a philosopher was the foundation of the so-called Neo-Hegelian School. He is supposed to have been taken by Mrs. Ward as a model for her Mr. Gray in 'Robert Elsmere'; but the resemblance is by no means complete, as Mr. Gray's work is undoubtedly, as he appears in 'Robert Elsmere,' rather that of a destructive literary critic than a constructive philosopher. His works include: 'Introduction to Hume's Treatise of Human Nature' (1874); and 'Prolegomena to Ethics' (1883.)

Green Bay, Wis., a city and county-seat of Brown County, situated at the head or southern point of the bay of the same name, and at the mouth of the Fox River, on the Chicago & Northwestern, Chicago, Milwaukee & St. Paul, the Green Bay & Western R. R.'s.

Commerce and Industry.— Green Bay has an extensive commerce. Twenty-four passenger trains arrive daily over the four railroads entering the city. An extensive lake traffic is also carried on, the harbor, through government appropriations, having been made accessible to the largest vessels upon the Great Lakes. Coal constitutes the largest single import, Green Bay being an advantageous distributing point. The largest export by way of the lakes is grain, although much lumber has hitherto been shipped out. A line of excursion steamers is also run to nearby summer resorts and to Mackinac and the "Soo." The city is provided with a complete electric railway system, including an interurban line up the Fox River valley to Kaukauna, where a junction is made with another electric line passing through Appleton, Neenah, Oshkosh and Fond du Lac. A light and power plant furnishes gas for lighting and heating and electricity for light and power, many electric motors now being in use. There are a number of manufacturing plants — 3 large breweries, 2 paper mills and 1 sulphite mill, 2 large saw mills, 2 planing mills, 1 very large canning factory, 1 shoe factory, 1 glove factory, 1 pure milk factory, 1 furniture factory, 2 woodenware factories, 3 machine shops, 1 candy and biscuit factory, 1 pickle factory, 1 coffin factory, 1 carriage factory, 1 cornice factory, 1 paper-box factory. Several jobbing and wholesale houses do a large business, the most important being a grocery house, a hardware house, and a crockery house. An extensive fish-shipping business is also carried on. Water is supplied from artesian wells by a private company.

Educational Institutions, Etc.— Green Bay has a number of fine public buildings, the Kellogg library, the Federal Buildings, Saint Joseph's Academy, three Hospitals, and just outside the city limits the State Reform School. The public school system consists of 2 high schools and 13 ward schools, employing 84 teachers. There are also several parish schools, graded in the same manner as the public schools. There are 6 Roman Catholic churches, 2 Baptist 2 Congregational, 1 Episcopal, 2 Evangelical, 2 Lutheran, 4 Methodist, 2 Moravian, 2 Presbyterian, and 1 Christian Scientist.

History.— Green Bay, the oldest town in Wisconsin, was first visited in 1634 by Jean Nicollet, who had been sent by Champlain, governor of New France, to find the rumored short route to China. The site was a favorable one for an Indian village as well as a landing place for explorers and missionaries. It is known that Marquette, Joliet, Allouez, and Tonti spent considerable time here. The town was therefore settled by the French, who impressed their character upon it for over 200 years, although it fell into the hands of the English at the close of the French and Indian war in 1763. In 1816 the Americans established a fort on the opposite side of the river, known as Fort Howard, around which a prosperous town of the same name grew up. In 1895 Fort Howard was annexed to Green Bay, and is now known as the West-Side.

Government, Etc.— The government of the city is administered by a mayor and common council, the latter consisting of sixteen members, elected for two years, two from each ward. Assessed valuation: Lots exclusive of buildings, $4,150,235; buildings, $4,279,740; personal property, $2,827,140; total, $11,257,115. Pop. (1903 est.) 20,142.

A. W. Burton,
Superintendent of Schools.

Green Bay, an arm of Lake Michigan, on the southwestern coast of the upper peninsula of Michigan and the eastern coast of Wisconsin. It is 120 miles long, from 10 to 20 miles wide, has an average depth of about 100 feet. Fox River, the outlet of Lake Winnebago, enters the bay at its head, at the city of Green Bay. The bay is navigable for the largest lake steamers. The largest cities on the bay are Green Bay and Marinette, in Wisconsin, and Menominee and Escanaba in Michigan.

Green Cove Springs, Fla., town, county-seat of Clay County; on the St. John's River, the Jacksonville, T. & K. W. railroad. It contains a warm sulphur spring noted for its medicinal properties. The trade is chiefly in fruits, vegetables, and lumber. Pop. 1,015.

Green Island, N. Y., a village of Albany County, on an island in the Hudson River opposite Troy, on the Delaware & H. and the New York C. & H. R. R.R.'s. It is connected with Watervliet and Troy by bridges; and has iron manufactories, machine shops and railroad car shops. Pop. (1900) 4,770.

Green Manuring, the agricultural practice of plowing under crops while succulent in order that they may enrich the surface layer by their decay. It is of ancient origin and wide popularity, especially in mild climates; less in tropical than it should be. The objects gained are the opening of the soil and especially the subsoil by the roots of deep feeding plants; the raising of plant food from the lower strata to the surface layer and the saving of available plant food in the surface layer, material that would leach away beyond the reach of shallow-rooted plants; the addition of humus to the soil by the decay of the plants; and, with certain crops, the addition of nitrogenous foods obtained from the air. As the plants decay they also act upon insoluble plant food in the soil and make it available. They belong to two classes: (1) shallow-rooted plants such as rye, buckwheat, mustard, rape, etc., which are specially useful on hard and poor soils open the way for more exacting crops; (2) deep-rooted plants such as clover, cow-pea, velvet bean, vetch and other leguminous plants which are still further useful because of their power of obtaining nitrogen from the air. See CLOVER; FERTILIZERS; LEGUMINOUS PLANTS; MANURES AND MANURING; ROOT-TUBERCLES; SOIL, and articles on the crops mentioned.

Green Monkeys, three similar species of small African monkeys, often seen in menageries, and representing the genus *Cercopithecus,* may properly be called green monkeys because of the prevailing tint of their fur. The one most commonly seen is *C. callitrichus,* the size of a cat, and remarkable for its unbroken silence. The vervet (*C. lalandi*) is smaller, grayish green, reddish white on the cheeks, throat and underparts, while the face, paws and end of the tail are jet black. It is common all over South Africa, where no other species of its large genus are found. The grivet (*C. griseoviridis*) is speckled olive-green, with a whitish forehead, chin and rump; it dwells in Abyssinia and is not numerous. All these monkeys, at least when young, are exceedingly docile and good-natured in captivity.

Green Mountain Boys, the regiments of Vermont settlers raised to defend the New Hampshire grantees against the efforts of New York to oust them or collect quit-rents, and later for service in the Revolution. See ALLEN, ETHAN.

Green Mountain State, a popular name for the State of Vermont, from its being crossed by the Green Mountains. See GREEN MOUNTAINS; VERMONT.

Green Mountains, a range belonging to the Appalachian system properly extending from near Long Island Sound through the western part of Connecticut and Massachusetts, into Vermont and Canada. In the State of Vermont the range is known as Green Mountains; but south, in Massachusetts and Connecticut, it is called by the names Berkshire Hills, Taconic Mountains, and Hoosac Mountains. The peaks of this range, one of the oldest in North America, have been worn down by erosion and weathering, until in many places they have become low, round hills. Their greatest elevation is in Vermont; Mounts Killington, Mansfield, Camels Hump, Lincoln, and Jay being the highest. Summit, a hamlet in the town of Mount Holly, in Rutland County, is the highest point crossed by a railroad. Some of the best building stone in the country is obtained from the Green Mountains. Granite and marble exist in large quantities, and on the western slope are layers of red sandstone. Iron and slate abound, and copper and manganese are found in several places. The range forms the divide between the basin of the Connecticut on the east and the Lake Champlain and Hudson River basins on the west. The rivers rising in the Green Mountains are short streams, but their water-power is abundant. In the fertile valleys are rich farms, and sheep and cattle are raised on the uplands. The hemlock, spruce, pine, and other evergreens which form striking parts of the forests, have given the name to this range. Hard wood trees and the sugar maple are found on both the east and west slopes of the mountains. The beauty of the scenery and the climate make the Green Mountains a place much frequented in summer by tourists.

Green River, in Kentucky, has its rise in Lincoln County, flows south and west to Adair County; west, a very irregular course, to Butler County; then northwest to the Ohio River which it enters a few miles above Evansville, Ind. It is about 350 miles long, and is navigable for small steamers for a distance of about 200 miles from the Ohio; but for a part of this distance artificial means have been used to make it navigable. In Edmonson County this river passes within 80 feet of the mouth of Mammoth Cave. The subterranean stream called Echo River, which is seen in connection with the Mammoth Cave, flows into Green River.

Green River, in Utah, has its rise in the western part of Wyoming, flows south and east into Colorado, south and west into Utah, then in a southern direction to the southeastern part of the State where it unites with the Grand to form the Colorado River. Major Powell (q.v.) and other explorers have passed through several of the remarkable cañons of this river. Its length is about 525 miles.

Green Snake, in the United States, a very slender, agile, harmless, grass-green, yellow-bellied serpent (*Liopeltis vernalis*), which is not only common in grassy places but in bushes, its color concealing it well in both places. It feeds mainly on insects. Several poisonous serpents of the far East, are called "green snakes" by English-speaking residents on account of their color.

Green Springs, Va., Battle of, 6 July 1781. Lafayette, reinforced by Steuben, was pressing close on Cornwallis' rear down York peninsula; and the advance-guard under Wayne came unexpectedly upon an entire division of the British at Green Springs, on the James River. Immediate retreat meaning destruction, he charged them so fiercely that Cornwallis, thinking the entire American army was upon him, merely repelled the assaulting party and drew off his men, while Wayne retreated in the other direction. The American loss was 145.

Green Vitriol. See COPPERAS.

Green'away, Kate, English artist: b. London 1846; d. there 8 Nov. 1901. She studied at Heatherley's, South Kensington, and the Slade School, and first exhibited in 1868 at the Dudley Gallery. For many years her work regularly appeared in the exhibitions of the Water Color

Society and the Academy. Her illustrations were widely published and popular in the United States as well as in Great Britain. She became especially famous for her pictures of child life, characterized by individuality of design, skilful coloring, and humorous touches. Her books include 'A Painting Book for Boys and Girls' and 'Kate Greenaway Birthday Book.'

Greenback-Labor Party, or **National Party.** The workingmen during the "panic years" (1874–8) increasingly resorted to political activity to right their grievances, and in Ohio in 1877 began to call their local organization the "National Party." In Massachusetts and Pennsylvania they fused with the Greenback Party (q.v.). On 22 Feb. 1878, at Toledo, Ohio, they held a convention which organized the fusion as the "National Party;" but the popular name for it was the old fusion name "Greenback-Labor." Their platform was the Greenback one, with planks against prison contract labor and in favor of legislation for shorter hours. The new organization awakened hopes in the hopeless minorities in several States where the majority, Republican or Democratic, could not be overturned; and they organized fusions with it, which raised it at once to a popular vote (apparently) of over 1,000,000, and elected 14 Congressmen. In the close States each old party kept its own vote, with a slight falling off to the new one. The party proper elected but two representatives, five of the 14 being really Republicans and seven Democrats. In 1880 (9–10 June) it held a national convention at Chicago, and nominated James B. Weaver of Iowa, and B. J. Chambers of Texas, for President and Vice-President; Chambers declined, but no substitute was nominated. The platform had all the old planks in substance, and new ones against Chinese immigration, land-grants to railroads, and favors to corporations and bondholders, and in favor of sanitary regulations for manufactories. The fusions had largely disappeared, and the popular vote sunk to 306,867, and the Congressmen to eight; four from Missouri, two from Maine, one from New York, and one from Texas. It retained its organization till 1884,when it fused with the Anti-Monopoly Party (q.v.) and nominated Benjamin F. Butler for the Presidency, polling in all 175,380 votes. It then practically disappeared.

Greenback Party (its own name Independent Party), 1874–6. The prosperity of western agriculture during the War, due largely to the heavy government purchases and the payability of mortgages in depreciated paper, was attributed by a large section there to the plentifulness of the paper by itself; hence, when hard times had succeeded, it was believed that a fresh inflation of greenbacks would reproduce the same conditions. The chief obstacle to this was thought to be the eastern banking interests, which, having bought government bonds in greenbacks, had obtained the act of 1869 making them payable in coin whether so specified or not; and should have been forced to take what they gave, the more since paper was now at par and their bonds were not taxed. By 1868 the Ohio Democrats, led by George H. Pendleton, were insisting on the payment in greenbacks of all bonds not specifically payable in coin, as the 5–20's; this was called the "Ohio Idea." Western Democratic conventions placed this plank in their platforms for three or four years, but the nomination of Greeley put an end to that in 1872. The revival of greenbackism is often attributed to the silver demonetization act of 1873; but in fact silver was above par at that time, the act drew no general attention, and but for the later fall in silver probably never would have done so. The real cause was the bringing forward of the Resumption Act, passed 14 Jan. 1875, to take effect 1879. On 25 Nov. 1874 a Greenback convention was held to protest against it, and adopted three resolutions — (1) that all bank and corporation currency should be withdrawn; (2) that no currency be allowed except government paper "based on the faith and resources of the nation," and exchangeable on demand for 3.65 per cent bonds; (3) that coin should be paid only for interest on the national debt, and for that part of the principal which promised it. Several Democratic conventions indorsed these; but in 1876 the prospect of the hard-money Tilden being the next Presidential candidate, led the party to form an organization of its own. At a convention at Indianapolis, 17 May, they nominated Peter Cooper of New York and Newton Booth of California for President and Vice-President; Booth declined, and Samuel F. Cary of Ohio was substituted. The platform, besides the three points above, demanded the repeal of the Resumption Act. The ticket polled 81,737 votes, over half of them in Michigan, Illinois, Indiana, Iowa, and Kansas. In the State elections the next year the party polled 187,095 votes, but the main strength continued to be in the West. The next year it was absorbed in the Greenback-Labor Party (q.v.).

Greenbacks (as printed in green ink), the current name, from the first, of the legal-tender notes first issued by the government during the Civil War. (See Debt, National.) The authorizing act was signed by Lincoln 25 Feb. 1862; it was the first ever passed by Congress making anything but coin legal tender, and nearly all the Democrats and many Republicans declared it unconstitutional. But war necessities were too exigent, and the bill authorized $150,000,000 of the notes, not receivable for import dues nor payable by the government as interest on its obligations. On 11 June 1862 and 3 March 1863 further issues were authorized; and on 3 Jan. 1864 they reached their maximum amount of $449,338,902. The great inflation, the uncertain fortunes of the War, and the belief that even if victorious the United States neither could nor would pay its enormous debt at face value, but would repudiate or scale it, combined to depreciate the value of the notes; throughout 1864 they were worth on an average only about 45 cents on the dollar, and on one day, 11 July, when Early was threatening Washington, they dropped in panic to about 35 cents — or as currently expressed, the "premium on gold" was 285. The legal-tender acts had always been understood to be temporary war measures only, and a choice of evils; the secretary of the treasury (McCulloch) in his report for 1865, expressed the opinion that they ought not to be in force a day longer than was necessary to prepare for a return to the gold standard. The House passed a resolution of cordial concurrence, 144 to 6; and on 12 March 1866 both houses agreed on a reducing act, by which on 31 Dec. 1867 the volume of greenbacks stood at $356,000,000. But the demoralization of economic sentiment and

judgment wrought by them, which afterward issued in the Greenback party, was already at work; many attributed the prosperity of the time to the currency inflation, and even in Congress a majority had determined to make the paper currency a permanent feature of our finance. On 4 Feb. 1868 any further reduction was prohibited, and the volume stood at this mark till October 1872, when it began to increase, amounting on 15 Jan. 1874 to $372,979,815. On 20 June 1874 the maximum was fixed at $382,000,000. Meantime a test case had been made up to try the question of their constitutionality (Hepburn *v.* Griswold: see LEGAL TENDER CASES), and in 1869 the Supreme Court, by five to three, headed by Chief-Justice Chase, decided against them. The fiercest political opposition was roused by this, however, and it became a party question. The Supreme Court, in May 1871, reversed its decision by one majority. This experience has led the Supreme Court to be excessively cautious about taking jurisdiction in any case where strong political feeling is involved. The question of legal tender has become unimportant since the passage of the "Gold Standard Bill" (q.v.), under which no depreciation in value is possible.

Green'brier, any of various prickly vines of the genus *Smilax* (q.v.), commonly the catbrier (*S. rotundifolia*), which grows all over the eastern half of the United States and is especially numerous in the Southern Alleghanies, where it designates various mountain-ranges, streams, etc.

Greenbrier Mountains, a range of mountains in the eastern part of West Virginia, lying west of the main part of the Alleghanies and parallel to the Greenbrier River (q.v.). Their average height is about 2,000 feet, the highest point being about 3,500 feet.

Greenbrier River, a river of West Virginia, rising in the Rich Mountains, Randolph County, flowing southwest into New River; length 150 miles.

Greenbrier White Sulphur Springs, W. Va., the name sometimes given the White Sulphur Springs in the Greenbrier Mountains to distinguish them from less important springs of similar character. See WHITE SULPHUR SPRINGS, W. Va.

Green'bush, N. Y., formerly a town now a part of the city of Rensselaer in Rensselaer County on the Hudson River and the Boston & A. and the New York C. & H. R. Railroads. See RENSSELAER.

Green'castle, Ind., city and county-seat of Putnam County, on the Cleveland, C., C. & St. L., the Louisville, N., A. & C. and the Vandalia Line R.R.'s; 35 miles northeast of Terre Haute. It is the seat of De Pauw University, with her 9 large buildings. She has excellent public schools and a fine library building containing 7,000 volumes. It was settled in 1822 and incorporated in 1849. The form of government is by a mayor and a municipal council elected every two years. Greencastle contains lumber-mills and manufactories of lightning rods, pumps, and one of the largest and best equipped tin-plate factories in the world. Pop. (1904) 4,200.

Greene, Aella, American journalist and poet: b. Chester, Mass., 1838; d. Springfield, Mass., 1903. He was the author of: 'Rhymes of Yankee-Land'; 'Into the Sunshine' (1881); 'Stanza and Sequel' (1884); 'Gathered from Life.'

Greene, Albert Gorton, American lawyer and poet: b. Providence, R. I., 10 Feb. 1802; d. Cleveland, Ohio, 4 Jan. 1868. Graduated from Brown University 1820, he was admitted to the bar in 1823; in 1832 became clerk of the town and of the municipal court of Providence, and in 1858 judge of the court. From 1867 he was in Cleveland, Ohio. He was at one time president of the Rhode Island Historical Society, was a founder of the Providence Athenæum, began the Harris collection of American verse (now at Brown University), and wrote some well-known poems, such as 'Old Grimes' and 'The Baron's Last Banquet.'

Greene, Charles Ezra, American engineer: b. Cambridge, Mass., 12 Feb. 1842; d. Ann Arbor, Mich., 17 Oct. 1903. Graduated from Harvard in 1862 and from the Massachusetts Institute of Technology in 1868, he was United States assistant engineer in 1870–1, city engineer of Bangor, Maine, in 1871–2, and in 1872 became professor of civil engineering in the University of Michigan. He also practised as consulting engineer, and in 1876–7 was associate-editor of the 'Engineering News.' His writings include: 'Graphical Method of Analysis of Bridge Trusses' (1875), 'Structural Mechanics' (1897), and other technical works.

Greene, Christopher, American soldier: b. Warwick, R. I., 1737; d. Westchester County, N. Y., 13 May 1781. He was among the first to take the field on the American side after the engagements at Lexington and Concord. Subsequently, as colonel of a Rhode Island regiment, he participated in the campaign in Canada under Arnold. In 1777, while in command at Fort Mercer at Red Bank, on the Delaware, he sustained an attack from a large force of Hessians under Col. Donop, who were repulsed with great slaughter. For these services a sword was voted him by Congress, and a monument commemorative of the battle and of the valor of the American commander was erected in the neighborhood of Fort Mercer in 1829.

Greene, Edward Lee, American botanist: b. Hopkinton, R. I., 20 Aug. 1843. After studying at Albion College, Wis., he took orders in the Protestant Episcopal Church (1871); but in 1885 entered the Church of Rome. He has been professor of botany at the Roman Catholic University in Washington since 1895, and has published 'Illustrations of West American Oaks' (1890); 'Flora Franciscana' (1891); and 'Pittonia' (1890).

Greene, Francis Vinton, American soldier: b. Providence, R. I., 27 June 1850. He was graduated at West Point with the rank of second lieutenant of artillery. In 1876 he was made military attaché at St. Petersburg and remained at the headquarters of the Russian army during the Russo-Turkish War (1877–8), in the course of which he was twice decorated for bravery. Obtaining his captaincy in 1883 he was three years later appointed instructor in military engineering at West Point, but left the service to join the Barber Asphalt Company, and was president of the National Asphalt Company when the trust went into the hands of receivers. He entered the National Guard in

1889 on the staff of Gen. Louis Fitzgerald and was elected colonel of the Seventy-first regiment in 1892. In the Spanish-American War he was commissioned major-general of volunteers and served principally in the Philippines. In 1902 he was appointed police commissioner of New York. He has written: 'The Russian Army and its Campaign in Turkey' (1879); 'Army Life in Russia' (1880); 'The Mississippi' (1882); 'Life of General Nathanael Greene' (1893).

Greene, George Sears, American civil engineer and soldier: b. Warwick, R. I., 6 May 1801; d. Morristown, N. J., 28 Jan. 1899. He was graduated at West Point in 1823 and was for several years one of the professors there, but in 1836 adopted civil engineering as a profession, after sending in his resignation as an officer in the United States army. He was engaged subsequently in railway construction in many eastern States, and in 1856 the Croton Aqueduct Department of New York city commissioned him to execute several important works. He designed and constructed the reservoir in Central Park, widened High Bridge, and built a water tower and reservoir at its western extremity. At the beginning of the Civil War he took command of the Sixtieth New York Volunteers, and was put in command of a brigade at Cedar Mountain and a division at Antietam. He took part in many other important events of the war and was severely wounded in an engagement near Chattanooga, in 1863. In 1866 he retired from the army and the following year was appointed commissioner and chief engineer of the Croton Aqueduct Department, and in 1871 was called to Washington, D. C., as chief engineer of public works. During his three years' incumbency of that office he planned the sewer system of the national capital.

Greene, George Washington, American historian: b. East Greenwich, R. I., 8 April 1811; d. there 2 Feb. 1883. He was a grandson of Gen. Nathanael Greene (q.v.) of Revolutionary fame. After study in Brown University, he traveled extensively in Europe, was United States consul at Rome in 1839–45, and from 1848 until his resignation in 1852 was professor of modern languages at Brown University. He was appointed non-resident professor of history at Cornell in 1872. His publications include several historical works, such as: 'Historical View of the American Revolution' (1865), 'Life of Nathanael Greene' (1867–71), 'The German Element in the War of American Independence' (1876), and a 'Short History of Rhode Island' (1877).

Greene, Homer, American author and lawyer: b. Ariel, Pa., 10 Jan. 1853. He was graduated from Union College in 1876, from the Albany Law School in 1878, was admitted to the bar in 1879, and entered practice at Honesdale, Pa. In Pennsylvania politics he has been active as a Republican. He has contributed much verse and prose to the magazines, and published: 'The Blind Brother,' 'Burnham Breaker,' 'Coal and the Coal Mines,' and 'The Riverpark Rebellion.'

Greene, Nathanael, American soldier: b. Patawomut, Warwick County, R. I., 7 Aug. 1742; d. Mulberry Grove, Ga., 19 June 1786. His father, a leading preacher among the Quakers, was the owner of an anchor forge and a grist mill. He was brought up as a Quaker, and trained from childhood to work on the farm and at the forge. Resolute perseverance in the midst of many obstacles gave him in the course of time a more than ordinary familiarity with ancient and English history, geometry, law, and moral and political science. In 1770 he was chosen a member of the general assembly for Coventry, whither he had removed to take charge of another forge; and from that time continued to take an active part in public affairs. He was one of the first to engage in the military exercises which prepared the way for resistance to the encroachments of the mother country, and this open renunciation of the principles of his sect was promptly followed by formal excommunication. In 1774 he joined the Kentish guards as a private; in July of the same year was married to Catharine Littlefield of Block Island, and in 1775 was appointed by the general assembly to command as brigadier-general the Rhode Island contingent to the army before Boston. He joined his command at Roxbury on 3 June and from that time remained in active service without a day's furlough till the final disbandment of the army in 1783. At Boston his brigade was distinguished by its discipline, and after the evacuation he was entrusted with the defense of Long Island. He distinguished himself in the battle of Harlem Heights, later commanded a portion of Washington's army near Ft. Washington on the Hudson, and in September he was made major-general, and appointed to the command in New Jersey. At Trenton he led the division with which Washington marched in person, and, with Knox, was for following up the advantages of that brilliant surprise by advancing directly upon the other detachments of the enemy. He took an equal part in the battle of Princeton, and was entrusted by Washington during the winter with a confidential communication to Congress. At the Brandywine he commanded a division, and by a rapid march and successful stand preserved the army from utter destruction. At Germantown he commanded the left wing which penetrated into the village. On 2 March 1778, he accepted the office of quartermaster-general, which he held till August 1780, fulfilling its arduous and complicated duties in such a manner as to call forth from Washington when he left it the declaration "that the States have had in you, in my opinion, an able, upright, and diligent servant." On 23 June 1780, he checked with two brigades and a small body of militia the advance of a corps of 5,000 of the enemy in the brilliant battle of Springfield. He was in command of the army during Washington's visit to Hartford in September 1780, when Arnold's conspiracy was discovered, and sat as president of the court of inquiry upon Major André. In October of the same year, he was appointed to the command of the Southern army, which he found on his arrival, in December, in a state of utter disorganization and want. He soon advanced to a well-chosen camp on the banks of the Pedee, and began a series of operations which in less than a year stripped the enemy of nearly all their hard-won conquests in the two Carolinas and Georgia, and shut them up within the narrow limits of Charleston and its immediate neighborhood. Among the events of this active year were the battle of the Cowpens, won by Gen. Morgan at the opening of the campaign; a brilliant retreat from the Catawba

to the Dan; the battle of Guilford Court House, in which he lost the field, but gained the end for which he fought; the pursuit of Cornwallis to the Deep River; the daring advance into South Carolina; the battle of Hobkirk's Hill, a second defeat followed by the results of victory; the siege of Fort Ninety-six, raised by the advance of Lord Rawdon, but followed by the immediate evacuation of the post and the retreat of the enemy toward the west; the drawn battle of Eutaw Springs, and the advance upon Dorchester, spoken of by Washington as another "proof of the singular abilities" of Gen. Greene. Congress presented him with a medal for services in the battle of Eutaw Springs, and North and South Carolina and Georgia made him valuable grants of property. He removed to the estate of Mulberry Grove, on the Savannah River, Georgia, where he died of a sunstroke. Greene was a brilliant soldier, energetic, watchful, and strong in emergency. He was also much of a diplomat in persuading Congress of the necessities of the army, and in levying troops in a district not wholly favorable to the patriot cause. Consult: G. W. Greene, 'Life' (1867–71); F. V. Greene, 'General Nathanael Greene' (1893).

Greene, Nathaniel, American journalist: b. Boscawen, N. H., 20 May 1797; d. Boston, Mass., 29 Nov. 1877. At 12 he entered the office of the 'New Hampshire Patriot,' published at Concord, and at 15 became editor of the 'Concord Gazette.' After editing papers at Portsmouth, N. H., and Haverhill, Mass., he removed to Boston, where he established a new Democratic paper known as the 'Boston Statesman,' and published semi-weekly, its first appearance being on 6 Feb. 1821. During the administration of J. Q. Adams it was opposed to the almost unanimous sentiment of the city and State; but in 1829, when the general government passed into the hands of the Democratic party, President Jackson appointed Greene postmaster of Boston. He held the office for 12 years without interruption, and, although removed in 1841, was reappointed to it by President Tyler in 1844, and held it until 1849. In 1836 he translated a 'History of Italy' from the Italian of Sforzozi, which was followed by the translation of two volumes of 'Tales from the German' (1837). In 1843 he published 'Tales and Sketches from the French, German, and Italian.'

Greene, Samuel Dana, American naval commander: b. Cumberland, Md., 11 Feb. 1840; d. Portsmouth, N. H., 11 Dec. 1884. Graduated at the Naval Academy in 1859, he volunteered in January 1862 to serve as executive officer of the Monitor, whose capabilities were then untested, and during the engagement of the Monitor with the Confederate ram Merrimac, in Hampton Roads, he commanded the vessel on account of an accident to Captain Worden, his superior. After the war he was a professor at the Naval Academy for 10 years.

Greene, Sarah Pratt McLean, American novelist: b. Simsbury, Conn., July 1856. She was educated at South Hadley Seminary, and for several years taught school in Plymouth, Mass. In 1887 she was married to F. L. Greene. She has published 'Cape Cod Folks,' which achieved wide notoriety through the author's use of the names of living people for her characters, and the consequent lawsuits in which the publishers were involved (1881); 'Towhead, the Story of a Girl' (1884); 'Lastchance Junction' (1889); 'Leon Pontifex' (1897); 'The Moral Imbeciles' (1898); 'Vesty of the Basins' (1900)

Greenfield, Ind., city, county-seat of Hancock County, on the Pittsburg, C., C. & St. L. R.R., 20 miles east of Indianapolis. It has foundries, machine shops, and manufactures of glass, paper, stoves, etc. It is the birthplace of James Whitcomb Riley (q.v.). Pop. (1900) 4,489.

Greenfield, Iowa, town, county-seat of Adair County, on the Chicago, B. & Q. R.R.; 130 miles southeast of Sioux City. It is the commercial centre of a farming district. Pop. (1900) 1,300.

Greenfield, Mass., town, county-seat of Franklin County; on the Connecticut River, the Boston & M. R.R.; about 34 miles north of Springfield. Greenfield was once a part of Deerfield; but in 1738 it petitioned for a separation, which was not granted until 1743. Greenfield and vicinity has many famous historic associations. The massacre of Deerfield occurred in the winter of 1704, and a monument marks the place where an Indian struck down Eunice Williams, the wife of the parson, John Williams, on 1 March 1704. She was one of the 112 captives the Indians had started on the 300-mile march to Canada. Captain Turner was killed fighting in Indian battle, in the Greenfield Meadows. Agrippa Wells, a blacksmith, a brave captain in the War of the Revolution, was a resident of Greenfield. In 1903 the town celebrated her 150th anniversary. The chief manufactures are machinery, cutlery, shoes, paper, boxes, wooden-ware, bricks, toys, children's carriages. Pop. (1900) 7,927.

Greenfinch, or **Greenlinnet,** one of the most common and beautiful of European finches (*Ligurinus chloris*). The general color of the male is olive-green; primaries grayish-black, with bright yellow edges; under parts yellow; female brownish. Although its song is uninteresting it is a favorite cage-bird in Germany.

In Texas a greenish towhee bunting (q.v.) is locally called "greenfinch."

Greenhalge, grēn'halj, **Frederick Thomas,** American politician: b. Clitheroe, England, 1842; d. March 1896. His parents emigrated to the United States in his early years, and after completing his education by studying at Harvard for three years, he entered the Confederate commissariat department, was invalided, returned north, studied law, and was called to the bar in 1865. He was a popular governor of Massachusetts from 1894 till his death.

Greenhouse, any glass-roofed house used for plant growing. The term excludes cold frames and hot-beds, but in America includes many structures known in Europe by special names such as stove-houses, graperies, conservatories, etc. Greenhouses may be divided according to the temperature maintained in them; for example, cool-house, used for such plants as violets, pansies, daisies, etc.; conservatory, used for plants displayed but not propagated or forwarded in growth; the forcing house, in which plants are rapidly pushed

1. Blue Passion-flower (P. cœrulea). 2. Pomegranate, with opened fruit and flower. 3. An Orchid (Cattleya). 4. Abutilon (A. insigne). 5. Monkshood (Tropælium).
6. Anthurium (A. scherzerianum). 7. Begonia (B. boliviensis). 8. Pitcairnia (P. furfuracea). 9. Ladies' Slipper (Cypripedium venustum).

to marketable condition; the warm-house, used for tropical and heat-loving plants. Then there are houses designed for special crops and known as rose-, carnation-, palm-, orchid-, asparagus-houses, etc.

Since the beginning of the 19th century, and especially during the latter half, improvements in greenhouse construction, heating, ventilation, and management have made remarkable progress. In place of the heavy shade-casting roof of large wooden rafters and small panes is the large-paned, small iron-raftered roof; steam and hot water have supplanted the old flue systems; and the carefully pitched roof which favors the entrance of light in winter and not in summer, has replaced the roof of scarcely considered slant. Much attention is also given to location, some points considered being exposure to the sun, shelter from prevailing winter winds, adequate water supply, proximity to market, etc.

An idea of the importance of greenhouses may be gained from the knowledge that during the first quarter of the 19th century there were almost no greenhouses except the few cumbersome ones upon some private places, and that in 1899 there were about 9,000 commercial florists' establishments averaging about 2,500 square feet, valued at 50 cents a square foot, and a producing capacity of $1.00 a square foot — totals of $11,250,000 and $22,500,000, respectively. Besides these are hundreds of private establishments, many of which would have been considered very extensive as commercial houses 75 or even 50 years ago.

Consult: Taft, 'Greenhouse Construction' (New York 1893); Leuchars, 'Hot-Houses' (1850); Hunt, 'How to Grow Cut Flowers' (Terre Haute, Ind., 1893); Taft, 'Greenhouse Management' (New York 1898); Scott, 'Florists' Manual' (Chicago 1899); Bailey, 'Forcing Book' (New York 1897); *id.*, 'Cyclopedia of American Horticulture' (New York 1900–02).

Greenhouse Insects. Plants cultivated under glass are as subject to insect depredations as are those growing in the garden and orchard, unless the greatest care is exercised. In addition to many species of foreign origin, such as numerous kinds of scale-insects (q.v.) and aphides which are constantly being imported with exotic plants, we have native insects firmly established as indoor pests. One of the commonest and most destructive is the black scale (*Lecanium oleæ*), which is also a pest of importance in groves of citrus fruits and olives. The related hemispherical scale (*Lecanium hemisphæricum*) is still more distinctively a greenhouse pest; and several injurious orchard scales and mealy bugs (q.v.) are likely at any time to become so, but all may be controlled by fumigation with hydrocyanic-acid gas. The "white fly" (q.v.), which name, as used by florists, covers a number of species of *Aleyrodes*, is to be similarly treated.

Many plants grown artificially are attacked also by omnivorous greenhouse pests, such as the red spider (*Tetranychus bimaculatus*) and the greenhouse leaf-tyer, and by general field and garden pests such as cutworms, wireworms, and white grubs (qq.v.). The greenhouse leaf-tyer (*Phlyctænia ferrugalis*) is less affected by fumigation than most insects, and, with other caterpillars, can be successfully controlled only by hand-picking, clipping off and destroying the affected leaves, and by spraying with arsenical mixtures.

Roses are peculiarly subject to insect injury, and there are several specific indoor rose pests, such as Fuller's rose beetle (*Aramigus fulleri*), which also attacks azaleas, begonias, lilies, primrose, geranium, canna, and others. It appears to be nearly immune to insecticides in the adult condition; one must, therefore, employ hand methods, collecting and destroying the beetles, preferably in November and December, when they congregate on various plants. Injured plants should be pulled out, and the larvæ about them destroyed with kerosene emulsion or bisulphid of carbon. Numerous leaf-rollers, budworms, and leaf-tyers (qq.v.) are very injurious to the rose, by eating into the buds just before blossoming. Roses are seriously injured at times by gall-flies and by the rose-scale (*Aulacaspis rosæ*), and other scale insects. Violets cultivated under glass are much injured by insect pests, principally by the black or brown aphis (*Rhopalosiphum violæ*), violet gall-fly (*Diplosis violicola*), violet saw-fly (*Emphytus canadensis*), and the red spider, and greenhouse leaf-tyer. The black aphis is still restricted and dependent on commerce for carriage from one greenhouse to another, but has caused losses of thousands of dollars to single firms. It may be controlled by fumigation with hydrocyanic-acid gas, which also destroys the saw-fly and the gall-fly (properly a gall-gnat, q.v.), which attacks the leaves while they are young, the larva or maggot developing in folds, incorrectly termed "galls." Tobacco preparations and bubach insect-powder are also useful against these minute pests.

Green'land, an extensive island belonging to Denmark; on the northeast of the continent of North America, from which it is separated by Davis Strait, Baffin Bay, and Smith Sound; area 46,740 square miles. A great part of its north and precipitous east coast is yet unknown; but it does not extend farther than about lat. 83° N. Like the northern parts of North America generally, Greenland is colder than the corresponding latitudes on the eastern side of the Atlantic. In June and July the sun is constantly above the horizon, the ice on the coast is broken up and a few small lakes are opened; but the short summer is followed by a long and dreary winter. The interior, which is lofty, is uninhabitable, and all the villages are confined to the coasts, which are lined with numerous islands and deeply penetrated by fiords. The Danish colony extends to the Bay of Disco, in lat. 69° N. Cultivation is confined to the low shores and valleys, where grassy meadows sometimes occur with stunted shrubs and dwarfed birch, alder, and pine trees. Attempts to raise oats and barley have failed, but potatoes and turnips attain the size of a pigeon's egg, and cabbages grow very small. The radish is the only vegetable which grows unchecked.

The inhabitants of Greenland (see ESKIMOS) are of the Eskimo race, more or less mixed with European blood. The individuals of the mixed race hardly differ as to language and habits from the genuine Eskimo. Besides the natives, about 250 Europeans usually reside in the country, 30 to 40 of whom have married native women. The inhabitants are largely dependent on hunting and fishing. Whale blubber and seal oil

are used as fuel. The land animals are the Eskimo dog, the reindeer, the polar bear, the Arctic fox (blue and white), the ermine, the Arctic hare, and the musk ox. Among the amphibia the walrus and several species of seal are common. The seas abound in fish, the whale and cod fisheries being of special importance. Seafowl are abundant in summer, and largely killed. The chief mineral product is cryolite, but graphite and miocene lignitic coal are also found. Oil, eider down, furs, and cryolite are exported. For administrative purposes Greenland, or rather its coast, is divided into two inspectorates of North and South Greenland. The residences of the inspectors are at Disco Island and Godhaab, but the most populous district is Julianehaab.

Greenland was discovered by an Icelander named Gunnbjörn about 876 or 877, and was colonized from Iceland about the end of the 10th century. In the reign of Elizabeth Frobisher and Davis rediscovered the coast, but nothing was done to explore it till the Danish government in 1721 assisted Hans Egede, a clergyman, to establish a European mission settlement. Good Hope (Godhaab), which was successfully carried on by him and his son. Whale fisheries were established on the coast by the English and Dutch about 100. The interior of the country was first crossed by Nansen in 1888. There are 12 chief stations for trading and the Danish Mission; the southernmost is Julianthaab, the northernmost Upernavik. At Godhaab there is a seminary for training native catechists; of late, too, natives have been appointed pastors. Pop. (1901) 67,681.

Greenland Whale, or **Bowhead,** the largest and most restricted of the "right" or whalebone whales of the genus *Balæna* (*B. mysticetus*), which is absolutely confined to the arctic region, reports of its occurrence on other coasts originating in mistaking for it the almost cosmopolitan southern right whale. It grows occasionally to a length of 70 feet, but is usually considerably less; and is black, except a white patch on the under side of the jaw. This whale may yield 275 barrels of oil, and 3,000 pounds of whalebone. It has become comparatively rare through constant pursuit. Its general habits agree with those of its family (*Balænidæ*), for which see WHALEBONE WHALES.

Greenleaf, Simon, American jurist: b. Newburyport, Mass., 5 Dec. 1783; d. Cambridge, Mass., 6 Oct. 1853. He commenced the practice of law in 1806 at Standish, afterward practising at Gray and Portland. He was a reporter of the Supreme Court 1820–32; professor of law at Harvard University 1833–48, succeeding Judge Story in the Dean professorship in 1846; and upon his resignation in 1848 was made professor emeritus. Beside nine volumes of reports of the Maine Supreme Court proceedings he published: 'Treatise on the Law of Evidence' (1842–53); 'Principles of Freemasonry' (1820); 'Examination of the Testimony of the Four Evangelists by the Rules of Evidence, as administered in Courts of Justice, with an Account of the Trial of Jesus' (1846). He also edited Cruise's 'Digest of the Laws of England respecting Real Property' (1849).

Greenlings, a family (*Hexagrammidæ*) of coast-fishes allied to the rose-fishes, many species of which occur abundantly from northern California to Bering Sea, including several excellent and of local importance as food-fishes. They are brilliant in color, yellow and green being prominent; are carnivorous; and seek their food among kelp and about rocks.

Greenock, grĕn'ŏk, Scotland, in Renfrewshire, on the south shore of the Firth of Clyde, 22½ miles by rail west-northwest of Glasgow. The Watt Institution contains a marble statue of Watt by Chantrey. The harbor works date from 1707, and have cost upward of $7,-500,000. Ship-building has been carried on since 1760; sugar refining began in 1765, and there are also manufactures of steam-engines, anchors and chain cables, ropes, sailcloth, paper, wool and worsted, etc. Besides being the birthplace of James Watt (q.v.), famous because of his work on steam-engines, of Spence the mathematician, and of Principal Caird, it has memories of Rob Roy, John Wilson, and Galt, and contains the grave of Burns' "Highland Mary." Pop. (1901) 67,645.

Gree'nockite, or **Cadmium Blende,** a native sulphid of cadmium, having the formula CdS, and crystallizing in hemimorphic forms belonging to the hexagonal sytem. It is transparent, or nearly so, and yellow, with a vitreous or resinous lustre. It turns carmine when heated in a closed tube, returning to its original color upon cooling; and it dissolves in hydrochloric acid, with liberation of sulphuretted hydrogen. Greenockite is brittle, and has a hardness of from 3 to 3.5, and a specific gravity of about 5.0. In the United States it is found in Marion County, Ark., in the zinc-bearing districts of southwestern Missouri, and in a zinc mine in Lehigh County, Pa.

Greenough, grēn'ō, **Horatio,** American sculptor: b. Boston 6 Sept. 1805; d. Somerville, Mass., 18 Dec. 1852. When he entered Harvard at 16 he had already modeled in clay and attempted sculpture. A French sculptor named Binon, resident in Boston, was his first master. During his college career he enjoyed the friendship and advice of Washington Allston, and produced the design from which the present Bunker Hill monument was erected. He was graduated in 1825, and went to Rome with letters to Thorwaldsen. He returned to Boston in 1826, and after modeling busts of John Quincy Adams, Chief Justice Marshall, and others, again went to Italy and established his studio in Florence. His first commission was from James Fenimore Cooper, for whom he executed his 'Chanting Cherubs,' suggested by a portion of one of Raphael's pictures. This was the first original group from the chisel of an American sculptor. To Cooper, also, he was indebted for the commission from Congress to execute his colossal statue of Washington, finished in 1843, after many years' labor, and now in the national capital. During this time he executed, among other original works, the 'Medora,' the 'Angel Abdiel,' and the 'Venus Victrix' (Gallery of the Boston Athenæum). In 1851 he returned to the United States to superintend placing in its destination in Washington his group of the 'Rescue,' in which the triumph of civilization is symbolized. Many vexatious delays prevented the arrival of the work from Italy, and Greenough, unaccustomed by long absence to the turmoil of American life, and the variations of the American climate,

was attacked by brain fever, soon after he had commenced, in Boston, a course of lectures on art. He published a volume of 'Essays' on art topics. Consult: Tuckerman, 'Memorial of Horatio Greenough' (1853).

Greenough, James Bradstreet, American Latin scholar: b. Portland, Me., 1833; d. Cambridge, Mass., 11 Oct. 1901. He was graduated from Harvard College in 1856, for some time practised law in Michigan, in 1865 was appointed tutor in Latin at Harvard, in 1874 assistant professor of Latin, and in 1883 professor. In 1872 he began at Harvard a course in Sanskrit and comparative philology, and until 1880, when a chair of Sanskrit was founded, gave instruction in those subjects. He became widely known through a series of Latin text-books, particularly a 'Latin Grammar,' prepared in collaboration with J. H. Allen; and wrote also a 'Special Vocabulary to Virgil' verse in both Latin and English, and, with G. L. Kittredge, 'Words and Their Ways in English Speech' (1901).

Greenough, Richard Saltonstall, American sculptor: b. Jamaica Plain, Mass., 27 April 1819; d. Rome, Italy, 23 April 1904. Among works by him are the notably fine bronze statue of Franklin in front of the City Hall, Boston; the marble statue of Governor Winthrop at Mount Auburn cemetery, Cambridge; 'The Shepherd Boy and the Eagle' at the Boston Athenæum.

Greenough, Sarah Dana Loring, American author: b. Boston 19 Feb. 1827; d. Franzensbad, Austria, 9 Aug. 1885. She was the wife of R. S. Greenough (q.v.). Her works include: 'Treason at Home,' a novel (1865); 'Arabesques' (1871); 'In Extremis, a Story of a Broken Law' (1872); and 'Mary Magdalen,' a poem (1880).

Greenport, N. Y., village of Suffolk County, on the eastern end of Long Island, on the Long Island R.R.; 90 miles east of Brooklyn. It has an excellent harbor and shipyards, and the chief industries are fishing and shipbuilding. It is also a popular summer resort. Pop. (1900) 2,366.

Greens, Pot-herbs. Any plant whose foliage and succulent stems are prepared for the table by boiling. The former term is less applied to the plants themselves than to the dish prepared from them; the latter is often applied to the living plants, but rarely to the culinary preparation. Greens are eminently a spring dish; by proper management they may be obtained long before spring-sown vegetables grow from seed planted out of doors, thus arriving at a time when the appetite is jaded with the usual winter vegetables. Comparatively few (for example, basella and New Zealand spinach) are useful during the hot summer months, but then other vegetables and many fruits take their place. Some (for example, mustard, witloof) are obtainable in the autumn, and a few (kale, endive) even during winter.

In general these plants should all be grown upon rich, moist, well-drained, friable, loamy soil, since upon such they grow quickly, to a large size, and remain succulent and edible longer than upon poorer or drier soils. A soil containing abundant available nitrogenous plant food is particularly desirable. The ground should be thoroughly prepared by deep plowing or digging and the surface made as fine as possible by harrowing or raking. For earliest crops of such hardy plants as spinach and corn salad, the seed may be sown in autumn, and, where the winters are severe, and especially if snowless, protected with a mulch of marsh hay or other material free from weed seeds. They may also be sown as early in the spring as the ground can be worked. Tender plants such as basella, and those that require a high temperature for the germination of their seeds, for instance, purslane, should be sown only after the ground becomes warm. Beyond keeping the surface of the soil loose and free from weeds, the crops need practically no further care. To be best appreciated, greens should be gathered while very succulent and within as few minutes of meal time as are possible to wash and cook them. Since most of them occupy the ground for only a few weeks in earliest spring, they are usually planted by market gardeners between the rows of other slower growing crops or as precursors to the main crop.

Besides the cultivated pot-herbs (in America a rather small list), there are several scores of plants known most widely as weeds. Several of these are superior in some ways to the cultivated kinds. There is no reason why they should not be cultivated; indeed, they deserve cultivation. When to be grown in the garden, and when seed cannot be purchased, seed should be selected from those plants that most nearly meet the intending grower's ideal. Probably the best known and most frequently used weeds or wild plants are the following, several of which are more or less cultivated: Lamb's quarters or Goosefoot (*Chenopodium album*), Pigweed (*Amarantus,* various species), Pokeweed (*Phytolacca decandra*), Marsh marigold, "Cowslip Greens" (*Caltha palustris*), Mustard (*Brassica,* various species), Dock (*Rumex,* various species), Quinoa (*Chenopodium Quinoa*), Sorrel (*Oxalis,* various species), Purslane (*Portulacca oleracea*), Plantain (*Plantago,* various species), Chicory (*Cichorium Intybus*), Cress (*Cardamine, Spilanthes, Barbarea, Senebiera, Gynandropsis, Nasturtium* — various species in each genus), Peppergrass (*Lepidium,* various species), Mercury or markery (*Chenopodium Bonus-Henricus*), Nettle (*Urtica,* various species), Winter purslane (*Montia perfoliata*), Rocket salad (*Eruca sativa*), Salad-burnet (*Porterium Sanguisorba*).

Of the cultivated pot-herbs the following are probably the best known and the most widely cultivated: Spinach, corn salad, chard, borage, dandelion, callards, mustard, kale, orach, marigold, basella, chicory, endive, nasturtium, unheaded cabbage and cauliflower, young beets and turnips, whole or only the leaves, and rape are frequently used also.

Green'sand, in geology, the name given to two series of cretaceous formations, the Upper and Lower Greensand. The Upper Greensand is a subdivision of the Upper Cretaceous rocks, and is situated immediately below the chalk marl, and just above the gault. The beds of which it is composed have in them green particles of a mineral called glauconite. Among the fossils peculiar to it are various ammonites, two pterodontas, two species of fusus, etc. Some are of opinion that the so-called Upper Greensand from which these fossils came is

itself gault. The Lower Greensand is a series of beds constituting the Lower Cretaceous rocks and the lowest member of the cretaceous group. It is called in Europe Neocomian, a name adopted by Lyell, he considering the term greensand peculiarly inapplicable, as in the district where these strata were first observed sand of a green color was rather the exception.

Greens'boro, Ala., town, county-seat of Hale County; on a branch of the Southern R.R.; about 72 miles southwest of Birmingham. It was settled in 1816, and is in a cotton-growing section. The chief industries are the cultivation of cotton and corn. It is the seat of Greensboro Female Academy and of the Southern University. The latter was established by the Methodist Episcopal Church, South, and was opened in 1859. Pop. (1900) 2,416.

Greensboro, Ga., city, county-seat of Greene County; on the Georgia R.R.; 70 miles west of Augusta. It is the trade centre for a thriving agricultural region, and it has a large creamery, a cotton-mill, cotton-gin, and a cottonseed-oil mill. Pop. (1900) 1,511.

Greensboro, N. C., city, capital of Guilford County, on the Southern R.R.; 81 miles northwest of Raleigh; named in honor of Gen. Greene, who commanded the Continental army in the battle of Guilford Court House 15 March 1781. Here are the Greensboro Female College, Bennett School for Colored Youth, Guilford College, and the State Normal and Industrial College. Greensboro is the centre of a tobacco, fruit, and grain region, which has gold, copper, and iron mines, and contains a blast furnace for the manufacture of Bessemer steel; cotton-mills and other industries. The growth of the city has been marvelous and shows the rapid development of the New South. Pop. (1880) 2,105; (1890) 3,317; (1900) 10,035; (1903) 22,000.

Greensboro Female College, a non-sectarian educational institution for women in Greensboro, N. C.; founded in 1826 as the Edgeworth Female Seminary; reported at the close of 1900: Professors and instructors, 15; students, 250; volumes in the library, 7,000; income, $25,000; number of graduates, 692.

Greensburg, Ind., city, county-seat of Decatur County; on the Cleveland, C. C. and St. L. R.R.; about 55 miles northeast of Cincinnati. Nearby are large stone-quarries; it is surrounded by a good agricultural region, and is supplied with natural gas. Its chief manufactures are flour, furniture, farm implements, and carriages. Pop. (1900) 5,034.

Greensburg, Pa., borough, county-seat of Westmoreland County; on the Pennsylvania R.R.; 31 miles east-southeast of Pittsburg. It is in a coal-mining, coking and natural gas region; and contains a steam-heating apparatus factory, steel works glass works, nut and bolt works, and has three National banks. It is the seat of St. Joseph's Academy. In Hanna's Town, which was near the present Greensburg, was held (1773) the first regularly organized court of justice west of the Alleghany Mountains. Hanna's Town was destroyed by the Indians in 1782. Pop. (1900) 6,508.

Green'shank, a large species of sandpiper (*Totanus glottis*) breeding in the northern parts of the Old World, and migrating far southward. Several allied species of similar habits occur in America, of which the greater and lesser yellowlegs (q.v.) are familiar to gunners.

Greens'let, Ferris, American writer: **b.** Glens Falls, N. Y., 30 June 1875. He was educated at Wesleyan University and beside contributions to reviews has published 'Joseph Glanville: a Study in English Thought and Letters of the 17th Century' (1900).

Green'stick Fracture, the name given to a fracture of a bone when continuity is not entirely severed one portion of the bone remaining unbroken or bent. The leg and arm bones of children are particularly liable to this fracture.

Green'stone, formerly a granular rock, consisting of hornblende and imperfectly crystallized feldspar, the feldspar being more abundant than in basalt, and the grains or crystals of the two minerals more distinct from each other. It was called also dolorite. Sir Charles Lyell included under the term greenstone those rocks in which augite was substituted for hornblende, the "olorite" of some writers, and those in which albite replaced common feldspar. This was sometimes termed andesite. The term is now used the same as diorite, which is an essentially crystalline granular admixture of triclinic feldspar and hornblende. It is not now held to be the equivalent of dolorite. In geology, volcanic rock, occurring in dykes, tabular masses, etc.

Green'ville, Ala., city, county-seat of Butler County; on the Louisville & N. R.R.; about 77 miles northeast of Mobile. Its chief manufactures are lumber and furniture; it has a cotton-gin, and its trade consists principally in cotton and lumber. Pop. (1900) 3,162.

Greenville, Ill., city, county-seat of Bond County; on the Vandalia & T. H., and the Louisville J. & St. L. R.R.'s; about 42 miles east of Alton. It is the seat of Greenville College, under the auspices of the Free Methodist Church. The chief manufactures are flour, lumber, wagons, and carriages, bricks, and in addition to its manufactured articles, it has considerable trade in coal, from the coal-fields of the vicinity, and in the agricultural products of the surrounding country. Pop. (1900) 2,504.

Greenville, Mich., city, in Montcalm County, on the Flat River, the Toledo, S. & M. and the Pere M. R.R.'s; about 42 miles northeast of Grand Rapids. Its chief manufactures are lumber, flour, agricultural and lumbering implements, refrigerators and furniture. Its trade is in its own manufactured products and in the agricultural products of the surrounding country. Pop. (1900) 3,381.

Greenville, Miss., city, county-seat of Washington County; on the Mississippi River, the Southern and the Yazoo & M. V. R.R.'s; about 139 miles south of Memphis. It contains several cottonseed-oil-, saw-, and planing-mills, a national bank, and has steamboat connection with all important ports on the river, and a large cotton trade. Pop. (1900) 7,642.

Greenville, Ohio, city, county-seat of Darke County; on Greenville Creek, and the Cincinnati, J. & M. the Dayton & U., and the Pittsburg, C., C. & St. L. R.R.'s; 35 miles north of Dayton. It is noted as the site of Anthony Wayne's treaty with the Indians, 3 Aug. 1795.

In the early part of the 19th century Tecumseh (q.v.) lived here, in a little Indian village. It has a foundry, lumber mills, and machine shops, and is the trade centre for a large agricultural section. Pop. (1900) 5,501.

Greenville, Pa., borough, in Mercer County; on the Shenango River, the Erie, the Pennsylvania, and the Pittsburg, B. & L. E. R.R.'s; about 52 miles southeast of Erie. The Shenango furnishes an abundance of good water-power. The chief industrial interests are flour-mills, woolen-mills, saw- and planing-mills, foundries, machine-shops, railroad-shops, carriage and wagon works, tube-mills, machinery for oil-wells, and coal-mining. The coal and oil fields and the stone-quarries in the vicinity add to the industries of the town. The trade of the town is considerable, as it is the commercial centre of a large section of Mercer County and places nearby in Ohio. Greenville was formerly the seat of Thiel College, opened in 1870 under the auspices of the Lutheran Church. Pop. (1890) 3,674; (1900) 4,814.

Greenville, S. C., city, county-seat of Greenville County; on the South Carolina & G., the Southern, the Atlantic C. L. R.R.'s.; 153 miles northwest of Columbia. It is the seat of Furman University (Baptist), Greenville College for Women, Chicora Female College (Presbyterian), Greenville Female College (Baptist), a military institute, and a business college. It has cotton mills, carriage and wagon works, iron works, and flour mills. Pop. (1900) 11,860.

Greenville, Texas, city, county-seat of Hunt County; on the St. Louis Southwestern, the Texas Midland, and the Missouri, Kansas & Texas R.R.'s; about 235 miles north of Houston and 51 miles northeast of Dallas. Greenville was settled in 1844 and incorporated in 1875. It is situated in an agricultural and stock-raising section. The chief industrial interests are connected with cotton and live stock. It has cotton-compresses, cottonseed-oil mills, flour mills, machine-shops, stock-yards, and brick-yards. It is the trade centre for a large extent of country and has a large cotton trade. It is the seat of Burleson College, under the auspices of the Baptist Church, and of Holiness College. Its executive officers are a mayor and a municipal council who hold office for two years. The electric-light plant is owned and operated by the city. Pop. (1890) 4,330; (1900) 6,860.

Greenville (Ohio), **Treaty of,** 7 Aug. 1795. A treaty between the United States and all the Northwestern Indian tribes; the former represented by Anthony Wayne, who had defeated the Indians in the campaign of 1794, especially at the battle of the Fallen Timbers (q.v.). A full delegation was present from every hostile tribe, the whole numbering 1,130. They surrendered to the whites all southern Ohio and southeastern Indiana, with lands around Fort Wayne, Fort Defiance, Detroit, Michillimackinac, and the French towns, and 150,000 acres near the Falls of the Ohio (Louisville) which had been allotted to George Rogers Clark and his soldiers. The United States acknowledged the Indian title to the remaining territory, and agreed to pay annuities of $9,500 in all to the tribes. All prisoners on both sides were restored. This peace secured quiet to the borders for 15 years. But the guaranty of the lands to the Indians enabled the British to use the latter to desolate the borders in the War of 1812; and after the war (see TREATY OF GHENT) Great Britain attempted to make this treaty boundary a permanent one, forbidding United States settlement beyond it. See GREENVILLE, O.

Greenway, Thomas, Canadian statesman: b. England, 1838. In 1844 he came with his father to Ontario. He took up land in Manitoba, and in 1887 became the Liberal leader and Prime Minister in the provincial government, when his party came into power in 1888. He has always studied the well-being and progress of his province; has attempted to abolish French as an official language, and to do away with the separate school system.

Greenweed. See DYEWEED.

Greenwich, grēn'wĭch, Conn., town, in Fairfield County, on Long Island Sound, the New York, N. H. & H. R.R., about 28 miles northeast of New York. The town was founded in 1640, as a part of the province of New York, and remained within the jurisdiction of the Dutch colony from 1642 to 1650, when, by agreement between the English and Dutch, it became a part of Connecticut. In order to preserve the charm of its country life, it has retained the old form of town meeting government, with three selectmen as agents, as it was over 250 years ago, except in the central part of the town, where a borough government, a warden and six burgesses, has charge of affairs. There are five residential centres within its area of 80 square miles; namely, Byram Shore, Belle Haven, Greenwich village, Riverside, and Sound Beach. It is the seat of Greenwich Academy, Brunswick School, and Rosemary Hall. Pop. (1900) 12,172. Consult: Mead, 'History of the Town of Greenwich.'

Greenwich, grĕn'ĭj, England, metropolitan borough of London, in Kent, five miles from St. Paul's Cathedral and six miles southeast of London Bridge. It has many noted institutions, one of which is the Greenwich Royal Observatory, founded in 1675 by Charles II.; its first astronomer-royal was Flamsteed. Geographers of all countries reckon longitude from the meridian of Greenwich, although the local geography of many countries may be reckoned from their respective capitals. Greenwich Hospital, founded by Queen Mary, for disabled seamen "who protected the public safety in the reign of William and Mary, 1694," is located on the site of the palace where Henry VIII. and his daughters Mary and Elizabeth were born, and where Edward VI. died. The hospital consists of four distinct buildings, one of which was designed by Inigo Jones (q.v.), and the other three by Sir Christopher Wren (q.v.). James Stuart made the designs for the restored portion of the chapel; and the statue of George II., in the central square, is by Rysbrach. In 1873 Greenwich Hospital became the college for the Royal Navy. The Royal Hospital School for boys who may enter the navy, and the Blue-Coat School, are liberally endowed. Pop. (1901) 185,149.

Greenwood, Grace. See LIPPINCOTT, SARAH JANE (CLARKE).

Greenwood Cemetery, N. Y., the principal burial place of New York and neighborhood, in South Brooklyn, near Gowanus Bay: area 475 acres. It occupies a picturesque site, and is laid out so handsomely as to make it almost without a rival in the world. From its heights the waters of New York Bay may be seen on the one hand, and the broad expanse of the Atlantic on the other. There are 20 miles of roadway and more than 25 miles of footpaths. Many distinguished men and women are buried here. The main gateway is adorned with four magnificent sculptures in *alto relievo*, representing four scenes in the resurrection. The number of interments up to 1901 exceeded 300,000.

Greer, David Hummell, American clergyman: b. Wheeling, W. Va., 20 March 1844. He was graduated from Washington College, Washington, Pa., in 1862, and studied theology in the Episcopal Seminary at Gambier, O. From Brown University and Kenyon College he received the titles of Doctor of Divinity and Doctor of Laws. His first ministry was at Covington, Ky.; from there he was transferred to Clarksburg, W. Va., and in 1871 he was called to Grace Church, Providence, R. I. In 1885, Dr. Greer became rector of St. Bartholomew's Parish, the most fashionable and richest of New York Episcopal parishes. In 1890 he established the St. Bartholomew's Parish House, at 42d street and 3d avenue, at a cost of $400,000, built largely through the liberality of Cornelius Vanderbilt. This parish house embraces a wide field of charitable, missionary and educational work.

In 1903 Dr. Greer was elected coadjutor to Bishop Potter of the New York Episcopal diocese. He had previously declined three bishoprics, that of coadjutor-bishop of Rhode Island, bishop of Pennsylvania, and bishop of Massachusetts to succeed Phillips Brooks.

Greer, James Augustin, American rear-admiral: b. Cincinnati, O., 28 Feb. 1833; d. Washington, D. C., 17 June 1904. Entering the navy in 1848, he was promoted lieutenant in 1855, and was on board the San Jacinto when that vessel intercepted the English steamer Trent, on which were Mason and Slidell, the Confederate commissioners. He commanded the ironclad Benton in the fleet that passed the Vicksburg batteries; and in 1873 was in command of the Tigress in its search of the polar seas for the Polaris. He became rear-admiral in 1892 and was retired in 1895.

Greey, grē, **Edward,** American writer: b. Sandwich, Kent, England, 1 Dec. 1835; d. New York 1 Oct. 1888. After spending several years in Japan, he came to the United States in 1868, became a citizen, and engaged in commercial pursuits in New York. He published 'Young Americans in Japan' (1881); 'The Wonderful City of Tokio'; 'The Golden Lotus' (1883); 'The Captive of Love,' founded on a Japanese romance; 'The Loyal Ronins,' a translation from the Japanese, etc.

Greg'arine, a parasitic sporozoan (see SPOROZOA) dwelling in the intestines of many insects, crawfishes, and other arthropods.

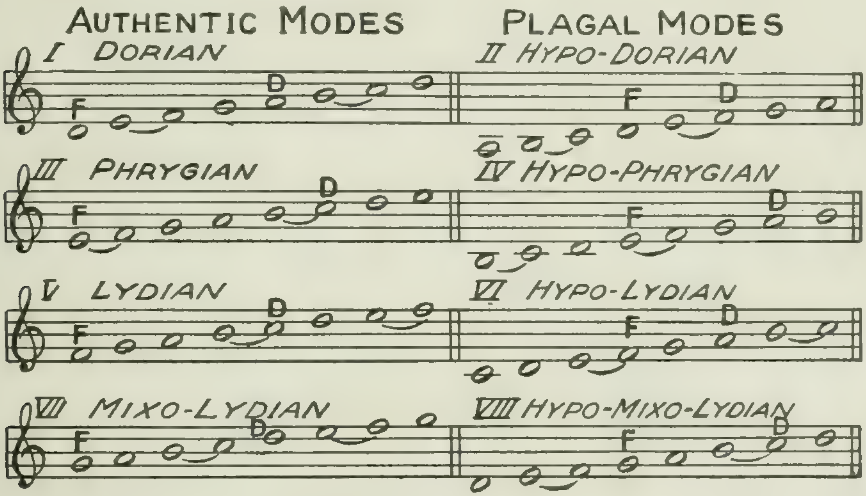
Gregg, David, American Presbyterian clergyman: b. Pittsburg, Pa., 25 March 1846. He was graduated at Washington and Jefferson College in 1865. He has been pastor in several places, and since 1889 has preached in Lafayette Avenue Presbyterian Church, Brooklyn, N. Y. He is editor of 'Our Banner,' and among his many published volumes may be mentioned: 'Makers of the American Republic' (1896); 'Ideal Young Men and Women' (1897); 'Facts that Call for Faith' (1898); 'Things of Northfield and Other Things' (1899).

Grégoire, Henri, ŏṅ-rē grā-gwär, COUNT, French churchman and statesman: b. 4 Dec. 1750; d. Paris 28 May 1831. In 1789, while cure of Emberménil, in the district of Nancy, he was sent by the clergy of Lorraine as their representative to the States-General. As one of the secretaries of the constituent assembly he joined the extreme democratic section, and in the convention voted for the condemnation, though not for the death, of the king. Although extreme in his democratic opinions, he was an unflinching Jansenist. He was a member of the Council of Five Hundred, of the corps législatif, and of the senate (1801). On the conclusion of the concordat he resigned his bishopric of Blois. He voted against the establishment of the imperial government, and alone in the senate resisted the restoration of titles of nobility. He himself afterward accepted the title of count, but in the senate always opposed Napoleon, and in 1814 was one of the first to vote for his deposition. He left numerous works, among them 'Ruines de Port Royal' (1801); 'Essai Historique sur les Libertés de l'Eglise Gallicane'; 'Historie des Sectes Religieuses depuis le Commencement de ce Siècle'; 'Annales de la Religion' (1795–1803).

Gregorian Chant (Latin, *cantus gregorianus, cantus planus, cantus firmus;* Italian *canto fermo;* French, *chant gregorien, plainchant;* German, *gregorianischer Choral*) is as old as the Church itself. As an integral part of the liturgy, music has its origin in the celebration of the Last Supper. According to the evangelists, Matthew and Mark, after the consecration and breaking of bread, our Lord and the apostles *sang* a hymn, which is commonly accepted to have been the "Great Hallel" of the Jewish passover celebration, that is, the Psalms, cxii.–cxvii. (Douai version), inclusive. The first Christian communities of Jerusalem in Palestine and Antioch in Syria were founded by newly converted Jews. Consequently it is more than probable that, although the converts from paganism were soon in the majority, melodies in use in the temple and in the synagogues continued to be sung at their religious meetings. This hypothesis is all the more reasonable because the recruits from paganism could offer nothing either in the way of poetry or music which would have been acceptable to the new cult. As to how the chant came to Rome and concerning its early development, archæology has so far been unable to ascertain any definite information. Conjecture and probability are the most we have to go by. Without doubt Greek music, which was known to the Romans, as was every other form of Hellenic culture, had its influence on the formation of the Christian worship music. It is certain also that there was a constant development and that singing played an ever greater role in the early liturgy. There were hardly any religious functions of which the singing of psalms, responsories and hymns did not form a part. From the fruitful soil of

the early Church sprang with great exuberance a new hymnology, which in turn, as its logical complement, was translated into melodies. Many of the latter were spontaneous improvisations, the children of ardent hearts and imaginations illumined by the New Light. At first the whole religious community participated in the singing, but as the liturgy became more elaborate and the assemblies more numerous, this participation on the part of all the faithful had to be restricted to certain portions of the service. Other, more particular parts were performed by the Primicerius, Præcentor or Monitor, who also had general charge of the singing and whose office it was to see that the faithful were well prepared for their allotted task. After emerging from the catacombs at the beginning of the 4th century the Church displayed its ever-growing vitality in the unfolding of her liturgy and the increasing splendor of her cult. At this period the chants used must have been numerous and varied. Popes and bishops fostered the liturgical music in every manner. Pope Sylvester (314) and Hilarius (461) founded schools for its cultivation. Saint Ambrose, Archbishop of Milan (397), took a step which was of greater importance than anything which had been done up to that time. He gave system and order to the melodies and chants in use in his archdiocese by giving them a theoretic basis. This he accomplished by adopting four modes or scales, each one of which had as its initial one of the four notes of the Tetrachord (sequence of four notes), D, E, F, G. The four modes adopted by Saint Ambrose were consequently: (*a*) (Dorian) D, E,F, G, a, b,c, d; (*b*) (Phrygian) E,F, G, a, b,c, d, e; (*c*) (Lydian) F, G, a, b,c, d, e,f, (*d*) Mixo-Lydian), G, a, b,c, d, e,f, g. All the melodies and chants used had some one of these modes for their foundation. Saint Ambrose originated the custom of singing hymns and psalms antiphonally.

When 200 years later, Gregory the Great, the man who gave the music of the Church its permanent character and from whom it is named, ascended the papal throne, the number of feasts and consequently of liturgical chants had increased to such an extent that the four modes fixed by Ambrose were no longer sufficient. Many of the new melodies did not belong to any one of the scales enumerated above. They had grown beyond the original frame. As Gregory partly reformed and, at least in outline, gave shape to the ecclesiastical year as we now know it, he was compelled also to rearrange existing chants, reject inferior ones, adapt old ones to new texts and add new ones of his own creation. In order to carry out this vast plan he found it necessary to enlarge the tonal system then in use. He retained the four Ambrosian modes, which were henceforth designated as the *authentic* modes, and added thereto four more which he called *plagal*. Gregory formed the new modes by transposing the last four notes of the existing — authentic — scales an octave lower, so that each plagal mode began a fourth below the *authentic* from which it sprang. Thus the tonal system as completed by Saint Gregory was as follows:



[N. B.— The letters F and D in the above diagram stand respectively for *final* and *dominant*. The *final* is the tone on which a melody finds repose, or a satisfactory ending. As will be observed, the *final* for any given authentic mode and its derived plagal are identical. The *dominant* is that tone which occurs oftenest or predominates in any melody.]

Four more modes were added to these in later centuries, but they are not different in essence from the eight named above. By means of various signs — dots, strokes, bars or hooks, collectively called neums — all of which had a conventional meaning, and which were placed over and alongside the words of the texts, Saint Gregory indicated the melodies to which these texts were to be sung. The book containing the chants for the numerous offices was called "antiphonarium cantorum." It was deposited near the altar of St. Peter so as to convey that the pontiff wished it to be considered as the norm for the whole Christian world.

In order to gain an insight into and an appreciation of the nature and character of the Gregorian melodies, it will be well to examine a little more closely the tonal material out of which they are constructed. We will notice that all the scales are diatonic, that is to say

that each one has five whole tones or steps and two half-steps or semi-tones; furthermore that the half-steps or semi-tones occur in a different place in each scale, according to what the initial note happens to be, and, finally that only one of them has a *leading tone* or half-step between the seventh step and the octave or repetition of the initial note. It is these three features which differentiate the Gregorian modes so markedly from our modern scales and which give them that impersonal and objective character so marvelously suited to the purpose they serve, namely, that of expressing the ideas and sentiments conveyed by the sacred texts. In other words, these modes, or tonalities, lend themselves to the expression of a mental attitude of objectivity as against the modern scales which, on account of their chromatic character, are more pliable vehicles for conveying the emotions springing from subjectivism and introspection. If we remember, in addition to the general character of the Gregorian, or Church modes — as they are often called — the rule which permits the use of six intervals only in the formation of Gregorian melodies, namely: the major and minor second, the major and minor third, the perfect fourth and the perfect fifth, we realize that this tonal system is better adapted for the expression of reverence, humility, peace, and joy, whereas the modern chromatic system is more suited for the expression of passion and dramatic conflict.

Saint Gregory used every means at his command to propagate the chant and have it universally adopted. He established schools for its proper interpretation. At one of these he is said to have taught in person. Missionaries who were sent from Rome into foreign lands took with them a copy of the antiphonarium, and, of course, a knowledge of how the melodies it contained should be sung. Thus, Saint Augustine brought the melodies to England at the command of St. Gregory himself. The great pope's successors continued the process of propaganda during the following centuries. In the 8th century Saint Boniface introduced the chant in Germany, and by him several "scholæ cantorum" were established on German soil. Through Pepin and after him through Charlemagne, it found its way into Gaul and into the whole territory under the emperor's sway.

It is held by many historians that the original chant was, in the main, syllabic, that is to say, that only one note was sung to each syllable and that only the word "alleluja" was ever extended over several notes. Be that as it may, it is certain that it gradually developed into a melismatic system, syllables being often extended over smaller and greater groups of notes.

From the time of Saint Gregory until the advent of Guido d'Arezzo (995–1050?) the primitive means of determining the melody, the neums described above, remained in use. As has been pointed out, these signs were intended to assist the memory of the singers in reproducing the melodies which they had learned by oral transmission. It is not to be wondered at that, in the course of time, many of the melodies were altered and modified in the many places where they were in use. There were frequent variations and modifications due to local habits, different temperaments, but, above all, to the insufficiency of the means employed to indicate with precision the form of the melodies. Careless copyists and finally the arbitrariness and caprice of singers in the various countries led to confusion. Before the time of Guido d'Arezzo, attempts had been made to fix with more precision the intervals of the melodies. He found in use two lines, a red and a yellow one, drawn across the page. Upon the red line was placed the F, and C was put upon the yellow one. Above, below and between these two lines the neums were written. By placing a black line between the two already existing and adding another above or below these three as the *ambitus* or range of the melody might require, Guido created the four line staff which has been used ever since for the chant, and made it possible to indicate precisely the form of a melody for all time to come. Guido and his pupils transcribed the existing chants into the new system of notation. Copies of these transcriptions found their way into the cathedrals and monasteries of many countries where they took the place of the books formerly in use. Though the neums as a *system of notation* were superseded by the more precise invention of Guido, they continued nevertheless to be employed to indicate the manner of *interpretation*. Although Guido's invention was epoch-making and of incalculable importance in the history of music, it must not be inferred that it was at once universally adopted. Neums as a means of notation continued in use in many places and institutions far into the 13th century. Nor must we imagine that because of the introduction of the new system of notation no further modifications of the chant took place. As new saints were canonized and new feasts instituted by the Church, offices and chants were necessarily created. Then the growing skill of professional singers gave rise, especially in the Alleluja following the gradual, to improvisations, elaborations and displays of virtuosity which often exceeded the limits of good taste and appropriateness.

As the melodies comprising ecclesiastical music grew out of the sacred texts and were never performed without being wedded to these texts, it is but natural to assume that the melodic construction partook of the rhythmical form of the texts. Especially must this have been the case when the chant was still largely syllabic. Some maintain that the ancient chant had a definite — artificial — rhythm, as in our modern music, in contradistinction to the natural, or that dictated by the rhythm of the text. Whatever the prevailing rhythm was at the beginning of the 10th century, it was now to undergo a gradual change. The monk Hucbald invented the *organum* or diaphony, that is, the practice of having a second voice sing the melody a fifth above or a fourth below the original, or add to the fifth also the octave, the first voice meantime maintaining the original melody. By this step Hucbald paved the way for the polyphony which was soon to develop and find its culmination in the wonderful creations of Palestrina and his school in the 16th century. Sulzer in his 'Allgemeine Theorie der Künste' in the article on harmony, points out that polyphony was latent in the unison singing of the Gregorian melodies by old and young, men and boys, each class of voice, soprano, alto, tenor, baritone, and bass, having a different pitch.

Hucbald's system of parallel motion of fifths and octaves was soon succeeded by attempts at contrary motion, and counterpoint as we know it, that is, point against point (or note against note) was born. To the Gregorian melody which now became "cantus firmus," that is, unchangeable melody, were added one or more others. In giving birth to the new system and continuing to be its foundation and the source whence polyphony drew its life and being, the Gregorian chant lost its most distinguishing characteristic, that is, its natural rhythm. The themes taken from the chant and used by contrapuntists as "canti fermi" were forced into the rhythmical straight-jacket. Each note of the cantus firmus had now to assume a definite value in order that the added melodies simultaneously sung might harmonize with it. Polyphony, or the new school of music, increased in favor very rapidly to the detriment of the old chant. Instrumental music, which was gradually developing, also had a deteriorating influence on the execution and cultivation of the ancient music of the Church. Counterpoint in many instances lost its original purpose and degenerated into artificiality. Composers used it to display their skill rather than to give expression to the ideas and emotions latent in and suggested by the text to which it was wedded. A reform movement toward primitive simplicity set in toward the end of the 15th and the beginning of the 16th century. The Council of Trent enacted laws concerning the abuses that had crept into the chant as well as against the extravagances which the display of skill for its own sake had brought about and which in fact almost caused the total exclusion of figured music from the Church. In a brief dated 25 Oct. 1577, Pope Gregory XIII. directs Giovanni Perluigi Palestrina and Annibale Zoilo (Palestrina was at the time director of the papal choir and Zoilo a member of the same) to revise the chants contained in the "Antiphonaria," "Gradualia," and "Psalteria," and "eliminate" therefrom "all barbarisms, obscure passages, contradictions, and superfluous additions which, through the ignorance, neglect, and also through the malice of composers, copyists, and singers, have crept into these books." A pupil of Palestrina, Giovanni Guidetti, had, a few years previously, edited the various chants for the celebrant contained in the Missal, which had been newly revised by a commission of cardinals appointed for this purpose after the Tridentine Council. Palestrina, Zoilo, and Guidetti in their labors of revision acted upon the principle which had been lost sight of for a time, but which was now generally accepted by musicians in Rome, "that the words of the texts should be sung to the notes as they ought to be spoken or declaimed without notes." This principle in its application brought into universal use the three different kinds of note-values: the longa, the brevis, and the semibrevis. The work of revision, of the Graduale only, which was continued and completed after Palestrina's death (2 Feb. 1594) by Felice Anerio and Francesco Suriano involved many excisions and abbreviations; reduced many chants which had been elaborately melismatic to a syllabic form. This revised edition derived its name "editio medicea," from the fact that it was printed by the "stamperia" or press of that name established in Rome by Cardinal Ferdinand de Medici. The Congregation of Sacred Rites, in 1595, appointed Giovanni Maria Nanino, Giovanni Andrea Dragoni, Luca Marenzio, and Fulgentio Valesio to edit, in accordance with the principles stated above, the 'Pontificale Romanum.' The revised books were now printed and published with the approbation of Pope Paul V. (1605–21) and that of the prefect of the Congregation of Sacred Rites. This approbation did not carry with it the prohibition of the use of the old, more elaborate, now called traditional, versions of the chant. No doubt because of the latitude thus permitted, the abbreviated version did not make much headway outside of the papal territory. Besides this, monody (solo singing) and the theatrical style in general came into vogue in Italy at the beginning of the 17th century. It took such a hold of public taste that even the works of Palestrina and the masters of his school were temporarily forgotten for the trashy and trivial products which now had the upper hand. This being the case with regard to the polyphonic style, it was natural that the austere, chaste, and simple Gregorian melodies should suffer even greater neglect. While in Italy and in some other parts of the world the chant was for a time neglected, there were countries, such as France, Belgium, Spain, and the Catholic parts of Holland, where it never ceased to be cultivated according either to the traditional or the abbreviated version. Many different editions came into use, notably in France, where many dioceses had their own versions. Toward the middle of the 19th century the plan entertained by Gregory XIII., Clement VIII., and Paul V., of having uniformity for the whole Catholic world in everything pertaining to the liturgy, including the chant, was revived with new vigor. Pope Pius IX., in 1868, appointed a commission to whom he entrusted the task of editing, in accordance with existing requirements, the "editio medicea," which Pius IX. and his successor, Leo XIII., repeatedly declared to be the official version of the Gregorian chant for the whole Church. During the past 30 years or more, however, archæologists — notably the Benedictines of Solesmes, A. Dechevrens, S. J. of Paris, the Belgian savant, G. A. Gevaerts, Dr. Peter Wagner of Freiburg, Switzerland, and others — have made exhaustive studies of the manuscripts dating from the 9th century (the oldest so far discovered) up to the Renaissance. The results of these studies have induced the present Pope, Pius X., to appoint (1904) a commission for the purpose of preparing what is to be called the "editio vaticana," which will embody the fruits of the researches and labors of learned men for many years past. Whatever may be the differences between this latest version and the many that have gone before, they will in no sense change the essential character of the chant. This character has its root primarily in the nature of the scales or modes used, as has been shown above, and, secondly, in the intervals in the construction of the melodies. As has been pointed out, the melodies sprang from the sacred texts of the liturgy: they were their complement and splendor. The Church has always declared the chant to be her own music par excellence. Other forms of music which she admits in her cult, the Palestrina, or polyphonic, and the mod-

ern styles, are to be judged as to their fitness in the light of the Gregorian chant, which is the norm and standard of excellence because it best expresses the attitude of prayer.

Bibliography.—Some of the works on the Gregorian chant which may be profitably consulted are: Haberl, 'Magister Choralis'; Kienle, 'Choral-Schule'; Gietmann, 'Kunstlehre' (Vol. III.); Kornmüller, 'Lexikon der Kirchlichen Tonkunst'; Gevaert, 'La Melopée Antique dans le Chant de l'Église Latine'; the Benedictines of Solesmes, 'Paléographie Musicale'; Dechevrens, Études de Science Musicale.'

JOSEPH OTTEN.

Gregorian Liturgy, the ritual which Pope Gregory I. introduced after 590 in the Roman Catholic Church in the administration of the Eucharist, as exhibited in the book entitled 'Gregorianum Sacramentarium.' St. Gregory made a new arrangement of the liturgy of Gelasius, which was previously in use, expunging from it what seemed to him useless and adding a very few new prayers. The celebration of the mass is still essentially the same as it was then.

Greg'ory, Saint, or **Gregory of Armenia,** surnamed "THE ILLUMINATOR," founder of the Armenian Church: b. Valarshabad, Armenia, 257; d. Mount Sebuh, Upper Armenia, 332. He was conveyed by a Christian nurse from his home in Armenia, when but two years old, to Cæsarea in Cappadocia to escape being slain with his family for the crime of his father Prince Auak, who had assassinated Chosrov I., king of Armenia. When he reached manhood he married a Christian lady of Cæsarea, who after bearing him two sons retired to a monastery. Thereupon Gregory entered the service of Tiridates III., son of Chosrov, who, with the help of the Romans, had recovered his father's throne. Tiridates imprisoned him for 14 years in a deep pit, for refusing to perform an act of idolatrous worship, whereupon the tyrant was punished by a horrible temper, of which Gregory cured him and converted him to Christianity. After the baptism of Tiridates Gregory was appointed bishop and patriarch of Armenia and consecrated by Leontius of Cæsarea. Tiridates established Christianity as the national religion of Armenia, a measure afterward imitated on a larger scale by Constantine the Great. Gregory spent the last year of his life in a hermitage on Mount Sebuh.

Gregory, Saint, of Nazianzus (GREGORIUS NAZIANZENIUS), Greek Church Father: b. Arianzas, near Nazianzus, Cappadocia, about 330; d. about 390. Receiving baptism, he retired for some time with St. Basil to Pontus. He began to preach in 362 and between 365 and 374, chiefly at Nazianzus. He went to Constantinople about 378 or 379 to oppose the Arians, and was appointed patriarch of that see in 380. The election was confirmed by the Council of Constantinople in 381, but during the same year he resigned and retired to his former charge of Nazianzus. We possess a number of sermons by him, a large number of letters and many poems. His eloquence is said to have placed him nearly on a level with Basil and Chrysostom. His festival is celebrated on 9 May.

Gregory, Saint, of Nyssa, Greek Church Father: b. Sebaste Pontus, about 332; d. about 398. By the influence of his brother St. Basil (q.v.), he was made bishop of Nyssa, in Cappadocia. He took a prominent part in the Councils of Constantinople from 381 to 394. He was less of an orator than Gregory of Nazianzus, but was more distinguished than any of the Greek fathers for a philosophical spirit, and for his acquaintance with the writings of the Greek philosophers. He also exhibited a liberality in his views uncommon in his day. His festival is on 9 March. His works consist of dogmatic treatises, Scripture commentaries, sermons, letters, etc.

Gregory, the name of 16 popes, as follows:

Gregory I., called the "GREAT": b. Rome about 540; d. 12 March 604. The death of his father put him in possession of great wealth, which he expended in the foundation of monasteries and charitable institutions. Disgusted with the world, he took the monastic vows himself and became a member of one of his own establishments. On the death of Pope Pelagius in 590 he was chosen his successor, an honor which he very unwillingly accepted. He displayed great zeal for the conversion of heretics, the advancement of monachism and the rigid enforcement of celibacy among the clergy; and there was nothing in which the Church was concerned that he deemed too small to lie beyond the sphere of his personal interest and action. (See GREGORIAN LITURGY, GREGORIAN MUSIC.) During his pontificate the pretension of John, patriarch of Constantinople, to the title of ecumenical patriarch, which Gregory repudiated, contributed to bring about the schism between the Greek and Latin Churches (see GREEK CHURCH). The works ascribed to him are very numerous, and have been frequently published. His genuine writings consist of a treatise on 'Pastoral Duty' (translated by King Alfred), 'Letters,' 'Scripture Commentaries,' etc. Consult: Snow, 'St. Gregory the Great' (1892); Mann, 'Lives of the Popes in the Early Middle Ages' (1903).

Gregory II.: b. Rome; d. 10 Feb. 731. He was elected pope and his pontificate is specially noticeable as forming an epoch in the progress of the territorial pre-eminence of the Roman See in Italy. Gregory II. was distinguished by his zeal for the evangelization of heathen lands; it was under his auspices that the famous Winfried or Boniface entered on his missionary work in Germany.

Gregory III.: b. Syria; d. 28 Nov. 741. He succeeded Gregory II. in 731. The encroachments of the Lombards in Italy during his pontificate became so formidable that as the eastern emperors still remained powerless or indifferent to the protection of the Italian provinces, the Romans charged Gregory to send a deputation to Charles Martel, which promised him the title of patrician and consul of Rome in return for his help against the Lombards. Charles Martel's preoccupation with the Saracens made it impossible for him to respond to this plea. But the fact that Gregory was authorized by the Roman primus to approach Charles on this subject and in this way shows how Rome was breaking away from the East, and so marks an epoch.

Gregory IV.: b. Rome; d. 27 Jan. 844. He succeeded Valentine in 828, and was greatly

esteemed for his learning and piety. During his pontificate the observance of the feast of All Saints was made general.

Gregory V.: b. Germany; d. 18 Feb. 999; sometimes styled BRUNO OF CARINTHIA. He was nephew of the Emperor Otto III. and through his influence was chosen first German pope and at the age of 24 succeeded John XV., in 996. An anti-pope, named John XVII., was set up against him by Crescentius, a consul of Rome, but was expelled by the emperor.

Gregory V., Ecumenical patriarch of the Greek Church: b. Dimitzana, Arcadia, Greece, 1739; d. Constantinople, 1821. His original name was Georgios Angelopulus, and he took his ecclesiastical name on entering the monastery on Mount Athos where he received his theological training. He was appointed archbishop of Smyrna in 1784 and patriarch of Constantinople in 1795. When the French invaded Egypt in 1798, the national spirit of Greece was aroused by hopes of deliverance from the Turkish yoke. Suspicions of conspiracy fell upon Gregory, and the Turks clamored for his head. Sultan Selim therefore banished him to Athos, but he was soon afterwards reinstated in his see. In 1821 the Greeks of the Morea revolted, and 21 March banishment was proclaimed against all who took part in the rebellion. Gregory had been put in charge of the family of Prince Murusi, who without the patriarch's connivance had been permitted to escape by the Russian ambassador. On Easter morning, 22 April, 1821, by command of the sultan Gregory with three bishops and eight of the clergy were hanged in front of the basilica. Three days later the Jews threw his body into the sea, where it was recovered by Greek sailors and carried to Odessa. The Greeks looked upon their murdered archbishop as a martyr, his bones were placed by the government in the cathedral at Athens, and his statue was raised in front of the university. Among his writings is a translation of St. Paul's epistles into modern Greek, with a commentary.

Gregory VI.: b. Rome; d. Cologne 1048. He succeeded John XIX. Finding the lands and revenues of his church much lessened by usurpations, and the roads infested by robbers, he acted with such vigor that a powerful party was raised against him by those accustomed to live by plunder. At a council, held at Sutri, in 1046, Gregory abdicated the pontificate.

Gregory VII. (HILDEBRAND): b. Soana, Tuscany, about 1015; d. Salerno, 25 May 1085. He became a monk at Cluny, and when Bruno, bishop of Toul, was elected pope by the emperor and diet in 1048 Hildebrand accompanied him to Rome, having persuaded him, it is said, to lay aside the insignia of the pontificate until he should receive the free suffrages of the clergy and people of Rome. Henceforth Hildebrand became the ruling spirit of the papacy. Leo IX. (Bruno) and his successors, Victor II. (1055), Nicholas II. (1058), Alexander II. (1061), confided in his counsels. He influenced the election of several of these popes, and procured the expulsion of the anti-popes Benedict and Honorius, who were opposed to Nicholas and Alexander. Under Nicholas II he succeeded in changing the mode of election to the pontificate. Hitherto the clergy and the people of Rome had a voice in the election. He gave the power of nomination to the cardinals alone, leaving the clergy and people only a right of concurrence, of which they were subsequently deprived. On the death of Alexander II. (1073) Cardinal Hildebrand was raised to the Papal chair. His efforts were directed to free the Church from the interference of temporal rulers, which had become quite an abuse in his day, and reform the numerous irregularities which had crept in among the clergy, especially in relation to the violation of the law of celibacy. In 1074 he issued his edicts against simony and the marriage of priests, and in 1075 an edict forbidding the clergy, under penalty of forfeiting their offices, from receiving the investiture of any ecclesiastical dignity from the hands of a layman, and at the same time forbidding the laity, under penalty of excommunication, to attempt the exercise of the investiture of the clergy. The Emperor Henry IV. refused to obey this decree, and Gregory, in 1076, issued a new decree summoning the emperor before a council at Rome, to defend himself. Henry then caused a sentence of deposition to be passed against the pope by a German council assembled at Worms. The pope, in return, excommunicated the emperor, and released all his subjects and vassals from their oath of allegiance. To escape being deposed by the pope, Henry hastened to Italy, where he submitted at Canossa (1077) to a humiliating penance, and received absolution. In the meantime his friends again assembled round him, and he then caused the pope to be deposed by the Council of Brixen, and an anti-pope, Clement III., to be elected in 1080, after which he hastened to Rome and placed the new pope on the throne. Gregory now passed three years as a prisoner in the castle of St. Angelo, but could never be induced to compromise the rights of the church. The character of Gregory was ardent and unyielding. In the pursuit of his ends in guarding the liberties of the Church he spared neither friend nor foe. The long dispute he began with Henry IV. about investitures survived both pope and emperor. The same subject involved him in disputes with France and England. He carried out his ecclesiastical reforms with an unbending rigor. He vigorously prosecuted those of the clergy who broke the law of celibacy, and in his contests with the emperors vindicated the spiritual authority of the Church as independent of the secular power. To the last he refused to withdraw the excommunications he had launched against the emperor, the anti-pope, and their adherents. The words which have been put into his mouth in dying, whether authentic or not, do no injustice to his inflexible spirit, "I have loved justice and hated iniquity; therefore I am left to die in exile." See Milman' 'Latin Christianity' (Vol. III.); Giesebrecht, 'Geschichte der deutsch–Kaiserzeit' (Vol. III.); Bowden, 'Life of Gregory VII.' (1840); Voigt, 'Hildebrand als Papst' (2d ed. 1846); Gfrörer, 'Papst Gregor VII.' (1859–61); Stephens, 'Hildebrand and his Times' (1888); and the studies by Söltl (1847), Villemain (1872; Eng. trans. 1873), Langerton (1874), and Meltzer (1876).

Gregory VIII.: b. Benevento; d. Pisa 17 Dec. 1187. He succeeded Urban III. in October 1187, and died the same year, after having exhorted the Christian princes to undertake a new crusade, and absolved Henry II. of England for the murder of Becket.

Gregory IX. (Ugolino, Count of Segni), b. Campania about 1147; d. Rome 21 Aug. 1241. He became a bishop of Ostia and cardinal, and in 1227 succeeded Honorius III. The principal events of his pontificate were the various incidents of his contest with the great Emperor Frederick II., whom he four times excommunicated, absolving his subjects from their allegiance, and proclaiming a crusade against him. The 'Decretals,' which he published in 1234, form the basis of the canon law of the Church.

Gregory X. (Tebaldo Visconti), d. Arezzo, 10 Jan. 1276. He was elected Pope in 1271, after an interregnum of two years. He convened a council at Lyons in 1274, the chief purpose of which was to promote a union between the Eastern and Western Churches.

Gregory XI. (Peter Roger), b. Maumont, Limoges, France, 1329; d. Avignon, 30 Dec. 1378. He was a nephew of Clement VI., and succeeded to the pontificate in 1370, after the death of Urban V. He was a patron of learning, and endeavored to reconcile the princes of Christendom and to reform the religious societies. He transferred the papal see from Avignon to Rome.

Gregory XII. (Angelo Conario), b. Venice about 1325; d. 18 Oct. 1417. He became pope in 1406, during the great schism of the West, Benedict XIII. being the other pope. Both were deposed by a council held at Pisa, and Alexander V. elected in their stead. Gregory abdicated at the Council of Constance in 1415, and thenceforward held the rank of cardinal-bishop of Porto.

Gregory XIII. (Ugo Buoncompagno), b. Bologna 7 Jan. 1502; d. 10 April 1585. He was one of the theologians of the Council of Trent; on his return thence was created cardinal in 1565. On the death of Pius V. Gregory was elected pope in 1572. Not one among the post-Reformation pontiffs has surpassed Gregory XIII. in zeal for the promotion and improvement of education; a large proportion of the colleges in Rome were wholly or in part endowed by him. The most interesting event of his pontificate, in a scientific point of view, is the correction of the calendar (q.v.), which was the result of long consideration, and was finally made public in 1582. Under his care was published also a valuable edition of the 'Decretum Gratiani' with learned notes. He was a zealous patron of the Jesuits, and supported the League in France against the Huguenots. He strongly supported Philip II. of Spain in his designs against England; and left the mark of his energy on almost every department of church life and work.

Gregory XIV. (Nicholas Sfondrate), b. Cremona 1535; d. 15 Oct. 1591. He was made a cardinal in 1583 and succeeded Urban VII. in 1590.

Gregory XV. (Alessandro Ludovico), b. Bologna 9 Jan. 1554; d. 8 July 1623. He became a cardinal in 1616 and succeeded Paul V. in 1621. He was the founder of the College of the Propaganda, and in 1622 canonized Ignatius Loyola, Francis Xavier and Philip de Neri.

Gregory XVI. (Bartholommeo Capellari) b. Belluno 18 Sept. 1765; d. Rome 1 June 1846. He was made prefect of the Propaganda in 1826 and was in effect minister of foreign affairs. He succeeded Pius VIII. in 1831. His rule was a period of no ordinary interest and difficulty in the history of the Church, and in the relations of the Vatican with the temporal powers of Christendom. Of simple habits he was very active in his conduct of affairs. His 'Triumphs of the Papacy' (1790) has been translated into both German and French.

Gregory, Casper René, American scholar: b. Philadelphia, Pa., 1846. Was graduated at the Universities of Pennsylvania, Princeton and Leipsic (1864–76). He has done important work in New Testament criticism, and has been professor of New Testament exegesis in the theological faculty at Leipsic. In addition to translations of critical works from the German, he has written 'Les Cahiers des Manuscrits Grecs' (1885); and the 'Prolegomena to Tischendorf's Editio Octava Critica Major of the New Testament' (1893).

Gregory, Edward John, English painter: b. Southampton, 1850. He first exhibited at the Royal Academy in 1876, and became known as a genre painter of distinction, whose lightness and refinement, combined with rare technique, were almost more French than English. His most characteristic pictures are 'A Rehearsal' (1882); 'The Swans of the Thames'; and 'Is it a Mouse?'

Gregory, Eliot, American painter and author: b. New York 13 Oct. 1854. He studied at Yale, obtained his education in art at Rome, and at Paris as a pupil of Cabanel and Carolus-Duran, and exhibited both sculpture and painting at the Salon. His pictures include genre works and portraits, among the latter being those of Admiral Baldwin, Ada Rehan and August Belmont. His books, published under the pseudonym "An Idler," are: 'Idler Papers'; 'Worldly Ways and By-Ways' (1898); and 'The Ways of Men' (1900), containing satirical observations on American life, especially that of plutocratic society.

Gregory, Francis Hoyt, American admiral: b. Norwalk, Conn., 1789; d. 1866. He was appointed midshipman in the United States navy in 1809, and during the war of 1812 was attached to the command of Commodore Chauncey on Lake Ontario. He was captured by the English in 1814 and confined till the close of hostilities. He saw service in repressing the Algerine pirates (1815–16) and the buccaneers of the West Indies (1821–23); took part in the Mexican War and commanded the African squadron (1849–52). He retired with the rank of rear-admiral in 1862.

Gregory, John Milton, American educator: b. Sand Lake, N. Y., 16 July 1822; d. Washington, D. C., 20 Oct. 1898. After graduation at Union College in 1846, he entered the Baptist ministry, but soon relinquished preaching for teaching. He was State superintendent of public instruction in Michigan in 1858–63; president of Kalamazoo College 1863–67; and president of the Industrial University in Champaign, Ill., in 1867–80. He published 'Compend of the School Laws of Michigan'; 'Handbook of History' (1866); 'A New Political Economy' (1882); 'Seven Laws of Teaching' (1883); etc.

Gregory of Tours (Gregorius Florentius), historian of Gaul, b. Averni, now Clermont,

France, 538; d. Tours 17 Nov. 593. He lived some time at the court of Austrasia, and became bishop of Tours in 573. His 'Historia Francorum,' though destitute of style or method, contains an invaluable collection of facts bearing on the manners of the Franks and Gallo-Romans, and the historical events of the period, and has caused him to be ranked as the Herodotus of Gaul. He also wrote lives of fathers, ecclesiastics and martyrs, etc. His complete works are contained in Migne's 'Patrologia' (Vol. LXXI.), and his history is included in the first volume of the 'Monumenta Germaniæ Historica' (1884–85).

Grenada (grĕn-ā'da̦) and **Grenadines,** grĕn-a̦-dēnz', islands of the West Indies. Grenada is the most southern of the Caribbean chain, and may be characterized as the most British and the most beautiful of all the British Antilles. Its length is 18 miles, its width 7, and its area 33 square miles. Lofty volcanic craters rise high above fertile and well-watered valleys. The volcanic character of the island is perhaps more marked, and is certainly regarded by geologists as being more recent than that of the northern Caribbees. A lake two miles in circumference lies among the mountains just mentioned, at an altitude of 3,200 feet. St. George, the capital, has a good harbor, a fort, and pretty houses and churches. The island is headquarters of the government of the Windward group (which includes with this the Grenadines, St. Vincent and St. Lucia), and has excellent schools, roads, waterworks, etc. The chief product is cocoa. Population about 54,000, of which number four-fifths are negro peasants. The Grenadines are long, low islands "of quaint forms and euphonious names," lying between Grenada and St. Vincent. The largest of them is less than 8,000 acres in extent, and their total area is approximately 87 square miles. They have in all more than 6,000 inhabitants, who raise and export cattle and provisions.

Marrion Wilcox,
Authority on Spanish America.

Grenade, gre̦-nād', a small hollow ball, cylinder, or cube, of metal, glass, or paper, about two and one half inches in diameter, which is filled with some explosive, and burst by means of a fuse when it falls among the enemy. Until about the end of the 17th century trained soldiers called grenadiers threw grenades by the hand. Grenades have been delivered from mortars, to repel the close attacks of besiegers sheltering themselves under the besieged walls. They have been found useful also in repelling boat attacks. At the siege of Mafeking in 1899–1900 dynamite grenades are said to have been thrown by the besieged. Grenades were one of the earliest forms of explosive projectiles. The gradual disuse of hand-grenades in war dates from the battle of Steinkerque in 1690. Hand-grenades are in use at the present time as fire extinguishers, chemicals being used to fill hollow glass balls, which are thrown into a burning mass. Many hotels, hospitals and public buildings in the United States are equipped with hand-grenades.

Gren'fell, George, English missionary and African explorer: b. Penzance, Cornwall, England, 1848. In 1874 he was despatched to Kamerun, Central Africa, where he founded the settlement of Victoria. He later reached the Congo, and rendered good services to science by his hydrographic survey of the Congo valley during his voyage in the steamboat "Peace." Notable was his exploration of the Ubangi (1885) whose identity with the Welle Makua he convincingly established. The geographical societies of Germany, France and England, published valuable communications from this intrepid traveler, who shares with Livingstone the reputation of a missionary who did much to promote an accurate scientific knowledge of interior Africa.

Gren'ville, George, English statesman: b. 1712; d. 13 Nov. 1770. He became treasurer of the navy in 1754, secretary of state in 1762, and first lord of the treasury and chancellor of the exchequer in April, 1763. In 1765 the Commons accepted his scheme for stamp-duties to be levied in the American colonies, which was one of the proximate causes of the American War of Independence. In 1766 he defended the stamp act in Parliament; in 1769 opposed the expulsion of Wilkes from the House of Commons, and in 1770 brought in the Controverted Elections Bill, which was passed. He was able, hard-working and honest, but narrow-minded and obstinate, wanting in tact and foresight. The 'Grenville Papers,' edited by W. J. Smith (1852–53), contain interesting information on the politics of the day.

Grenville, Sir **Richard,** English naval officer: b. about 1541; d. September 1591. In 1585 he commanded a fleet of seven vessels intended to aid in the colonization of Virginia. His most brilliant exploit occurred in 1591, when he attempted to cut his way through a Spanish fleet of 53 ships. His ship while becalmed was attacked by 15 of the largest Spanish vessels. Not till after 15 hours of battle and when only 20 out of his 150 men were left alive did he strike his colors. He died from wounds received in the engagement. It is upon this incident that Tennyson has founded his spirited ballad, 'The Revenge.'

Grenville Act, 6 April 1764. An act passed by the English Parliament on the proposal of George Grenville, a member of Lord Bute's ministry. Its purpose was more effectively to protect English trade and manufactures from foreign competition, to raise better revenues from the colonies. It was based on the act of 1733, which, to protect the British West India sugar industry, laid prohibitory duties on the import of French West India sugar and molasses into the colonies, and which, if enforced, would have ruined New England commerce. The new act made the duty on molasses a heavy revenue one instead; increased the duty on sugar, and laid new duties on wines; decreased the drawbacks on foreign articles exported to America; imposed regulations on manufacturers, and attempted to enforce the navigation acts more thoroughly; and prohibited all trade between the colonies and the French islands St. Pierre and Miquelon.

Gresh'am, Walter Quinton, American jurist and statesman: b. near Lanesville, Harrison County, Ind., 17 March 1832. His family originated in Kentucky, from which State his grandfather had removed to Indiana. There his father met with success as a farmer, and

also exercised the art of cabinet-making. He was elected sheriff and was murdered in the performance of his duties. The son was educated at the local school, and the State University, Bloomingdale, Ind. After leaving the latter he went to Corydon, Ind., and began the study of law, while filling the office of deputy clerk (1854). In 1860 he was elected to the State legislature. When the Civil War broke out he was commissioned in the Federal service as lieutenant-colonel of the 38th Indiana regiment. He was promoted under Grant, and at Vicksburg had charge of a brigade with the rank of brigadier-general of volunteers. He joined Sherman's forces in the expedition against Atlanta, Ga., where he commanded the 4th division of the 17th Army Corps. At Leggetts Hill, in January, 1864, he was severely wounded and disabled from service, and in the following year was retired as major-general of volunteers. He chose as his home New Albany, Ind., and began an active life as law practitioner. In 1866 he was put forward by his friends as Republican candidate for Congress, but was defeated at the polls, and for the two following years resided in New York, as the financial agent of his State. His next field of activity was as a jurist, for in 1869 President Grant appointed him judge of the United States circuit court for Indiana. He had previously declined an appointment as collector of customs at New Orleans, which would have necessitated his removal from Indiana. He had also declined the position offered him as district attorney. But his great abilities and high character had pointed him out as fitted for some important employment, and in 1882 no surprise was felt, but rather general expectation was satisfied when he received an appointment to the cabinet with the portfolio of postmaster general (1882). In 1884 he was called to the secretaryship of the treasury, in the discharge of whose duties he would doubtless have increased his reputation as a financier, had he not been appointed a few months later as United States circuit judge for the 7th judicial district. He made himself conspicuous as favoring the third term of his old friend Gen. Grant (1880). His own name had been put forward with some enthusiasm as presidential candidate in 1884, and again in 1888. There were many who thought that he had good claims to be invested with the office of the chief magistrate. Subsequently he changed his convictions on the most important question of the hour, and ranged himself on the side of views of tariff legislation with which the Republican party had no sympathy. The Populists, however, looked upon him with favor as his judicial decisions had in many cases been to their advantage. Had he consented, they would have nominated him for the presidency at the national convention of that party held at Omaha, Neb., in July 1892. He declined the honor and made a public statement announcing his purpose of supporting Grover Cleveland's nomination. He was afterward named by President Cleveland as secretary of state.

Gresham's Law, a principle in finance and political economy formulated about the middle of the 16th century by Sir Thomas Gresham, founder of the London Royal Exchange. It may be thus stated and expounded. Bad money drives out good money from the circulation. The good coin of full weight and purity in circulation with worn, light, or depreciated coins, will be hoarded or used for exportation, where it will buy more abroad than the worn out coins, which will be left to pass as counters at home. This law is still a living principle, and especially applicable in controverting the position of those who wish the United States, single-handed, to issue a currency of the double standard.

Gres'well, William Henry, English Anglican clergyman and author. He was educated at Oxford and has been rector of Dodington, Somerset, from 1888. As a writer he is known by 'Our South African Empire' (1885); 'Imperial Federation' (1887); 'History of the Canadian Dominion' (1890); 'Geography of the Canadian Dominion' (1891); 'Geography of Africa South of the Zambesi' (1892); 'The British Colonies and Their Industries' (1893); 'Growth and Administration of the British Colonies' (1897).

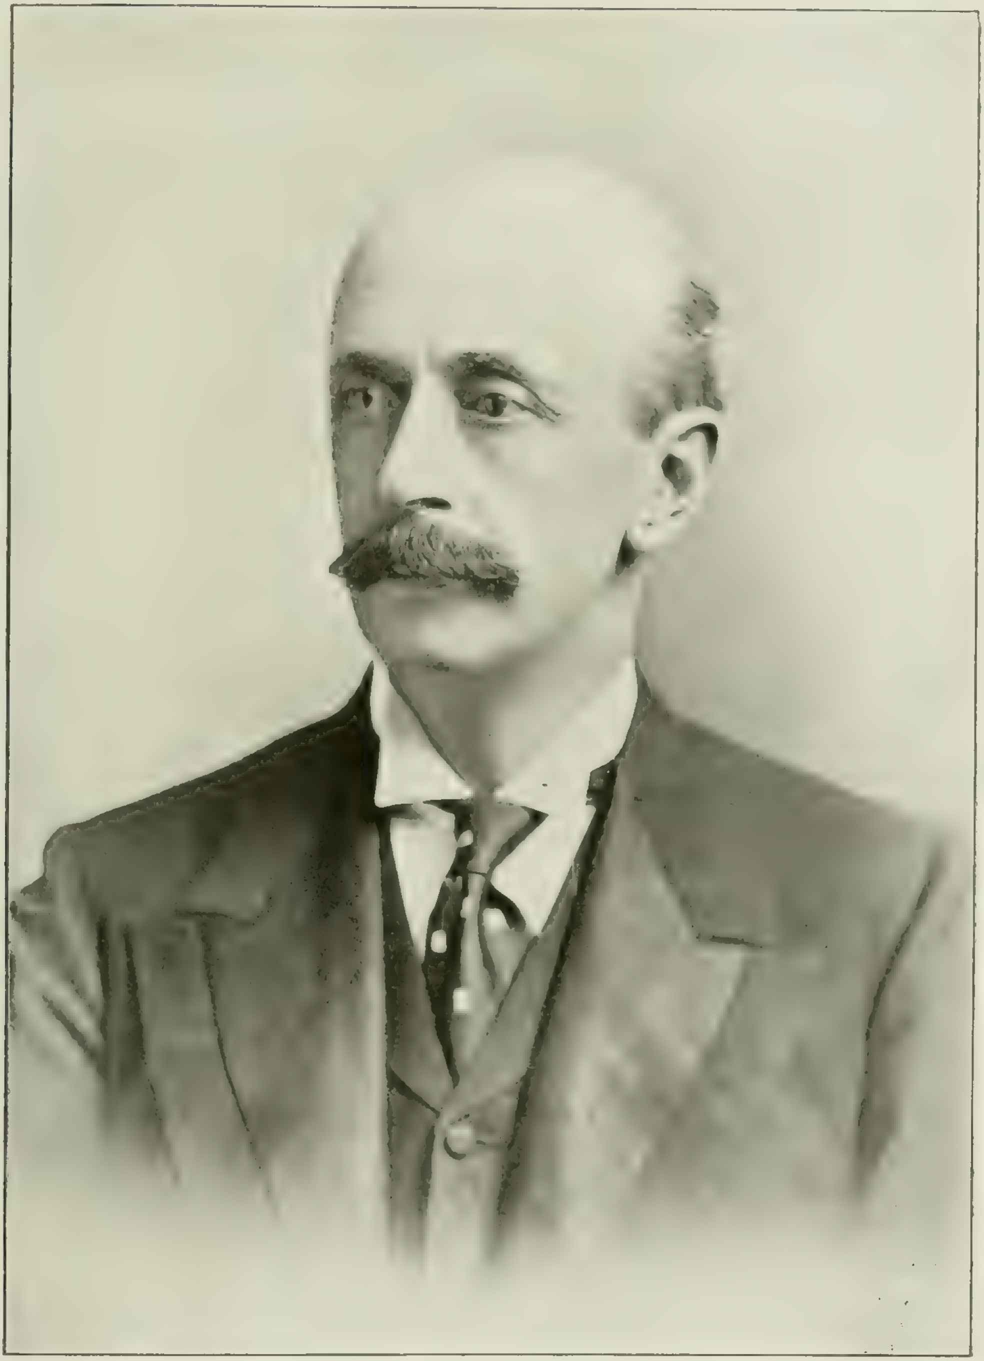
Gretna, La., town, capital of Jefferson Parish; on the Mississippi River and the Southern Pacific railroad; opposite New Orleans. A number of the Mississippi River packet lines take on and discharge shipments at Gretna. It was founded in 1835, and has now many of the advantages of a suburb of New Orleans. It manufactures cottonseed oil and its trade is chiefly in cotton and cottonseed oil. Pop. 3,875.

Gretna Green, or **Graitney**, Scotland, village in Dumfriesshire, on the Solway Frith, eight miles north of Carlisle. It was for nearly a century notorious as the place of celebration of the marriages of runaway couples from England. To conclude a lawful marriage in Scotland, it was then only necessary for an unmarried couple to go before witnesses and declare themselves man and wife. The English marriage service was usually read at these marriages by a pseudo-priest, said to be the blacksmith of the village, who has become in consequence a historical character in fiction. Gretna Green marriages are now at an end, in consequence of a statute which enacts that no irregular marriage contracted in Scotland shall be valid, unless one of the parties resides in Scotland, or has done so, for 21 days next preceding such marriage.

Grétry, André Ernest Modeste, äṅ-drā ėr-nā mō-dĕst grā-trē, French composer: b. Liège 8 Feb. 1741; d. Ermenonville 24 Sept. 1813. After completing his studies at Rome he settled at Paris and there his reputation was made. He was the most prolific composer of his age. He produced forty comic operas, most of which with the exception perhaps of 'Raoul' and 'Richard Cœur de Lion' are now forgotten. His 'Memoires' 1796, and his life by Gregoir and Brenet give the main incidents of his career.

Grev'ille, Henry. See DURAND, ALICE MARY.

Grevy, François Paul Jules, fräṅ-swä pōl zhül grā-vē, French statesman: b. Mont-sous-Vaudrey, Jura, 15 Aug. 1807; d. 9 Sept. 1891. He studied law in Paris, and became prominent as the defender of republican political prisoners. In 1848 he was returned to the Constituent Assembly, where his ability as a speaker soon



ALBERT HENRY GEORGE, THE FOURTH EARL GREY,

GOVERNOR-GENERAL OF CANADA.

made him distinguished. After the *coup d'état* he retired from politics, but in 1869 again entered the Assembly as deputy for the Jura. In February, 1871, he was elected president of the National Assembly, and re-elected in 1876, 1877, and 1879. When Marshal MacMahon resigned in 1879 Grevy was elected president of the republic for seven years. In December, 1885, he was elected president for a second term of seven years, but, hampered by ministerial complications, resigned in December 1887.

Grey, Albert Henry George, Fourth Earl, English statesman: b. Howick, Northumberland, England, Nov. 28, 1851. His grandfather, the second earl, was prime minister of England, and influential in securing the passage of the Reform Bill of 1832. The present earl was graduated from Trinity College, Cambridge; in 1880 he was elected to Parliament, as a Liberal, and supported Gladstone in the House until 1886 when the Liberals declared in favor of home rule. He then became a Liberal Unionist, but lost his seat in Parliament. In 1894, as his uncle died childless, he succeeded to the estate and title, and entered the House of Lords. He was a personal friend of Cecil Rhodes, was one of the promoters of the South African Company, and in 1896–97 served as governor of Rhodesia. As an executor of the Rhodes will, he is now one of the trustees of the scholarship fund. He has been an active worker in reform movements, especially in the cause of co-operation and of temperance. On his estate he has organized a co-operative system which has worked successfully; and in 1901 he organized a system for the management of public houses in the interests of the public, known as the Public House Trust. In 1904 he was appointed governor-general of Canada to succeed the Earl of Minto.

Grey, Lady Jane, English princess: b. Bradgate, Leicestershire, 1537; d. Tower Hill, London, 12 Feb. 1554. She was the daughter of Henry Grey, marquis of Dorset, afterwards duke of Suffolk. She displayed much precocity of talent; possessing an acquaintance with the classic and oriental languages, as well as French and Italian. She was married to Lord Guildford Dudley, fourth son of the Duke of Northumberland, in May 1553. Edward VI. was induced at his death 5 July 1553 to settle on her the succession to the crown. The council endeavored to keep his death secret, with a view to secure the persons of the princesses, Mary and Elizabeth. Mary apprised of their design, wrote expressing her surprise that she had not been advised of her brother's death, and commanding them on their allegiance to proclaim her title. The council replied, exhorting her to be quiet and obedient, and proclaimed Lady Jane on the 10th. On the approach of Mary the council, unsupported in their usurpation, meanly deserted their victim Lady Jane, and joined in proclaiming Mary queen on the 19th, and on the 20th Lady Jane was confined to the Tower. On 13 Nov. she and her husband were arraigned, and pleaded guilty of high treason; but they might, perhaps, have been allowed to expiate their imprudence by a temporary confinement, but for the ill-advised insurrection under Sir Thomas Wyatt, in which the Duke of Suffolk, Lady Jane's father, was weak enough to participate. The suppression of this rebellion was followed by the execution of Lady Jane Grey and her husband on Tower Hill.

Greyhound. A long, tall, slender hound, the standard features of which are described under DOG. It hunts by sight, is fitted for the swiftest running and leaping, and is used in the sport of coursing (q.v.). In the United States greyhounds are kept mainly as pets; yet in the West are used in chase of jack-rabbits, prong-horn antelopes and coyotes. Few horses are able to keep up with them, even in a level country, and on an irregular surface they distance horses easily. The modern thin, smooth-haired type, to which the name is now popularly restricted, is a development from a form which arose in western Asia before the Christian era, and was adopted and esteemed in Syria, Egypt and Rome, during the classic period. It was taken west with the Romans in their conquest of Europe, and later became the favorite dog of the nobility, an accompaniment of falconry. At that time black, or black-and-white were the approved colors. There seems to have been little essential change of form or qualities during this prolonged history, and literature and art abound in commemoration of the dog's grace, kindliness and exploits in the field. There arose at an early time a diminutive variety not half the size of its namesake (about 7 pounds in weight) fragile, delicate, and of no use save as an ornamental pet, which is now known as the Italian greyhound. It is of almost any whole color,— black, mouse-grey, fawn or rarely white. Besides these satin-coated «long-dogs,» others arose in the colder parts of Europe which differed from the greyhound only in having a «rough,» that is long-haired, coat. These are the Irish wolfhounds (see WOLFHOUND), the Scotch stag or deerhound (see DEERHOUND), and the Russian wolfhound or psovie (see BORZOI).

Greytown, old name SAN JUAN DE NICARAGUA, destroyed in 1854 by the United States. (For the general situation, see CLAYTON-BULWER TREATY.) In May 1854 the captain of an American steamship had a quarrel with a negro, and shot him dead; the mayor of the city ordered him arrested, and the passengers on the ship, as well as Solon Borland, the United States minister to Nicaragua, took the captain's part and resisted the arrest. The native inhabitants were indignant and mobbed Borland, whereupon the United States war-vessel Cyane, Commander Hollins, was sent to exact reparation. Hollins espoused the cause of an American transit company who were making excessive claims, and ordered the mayor to pay them at once; on their refusal he bombarded and burnt the place. This outrage embroiled the United States with Great Britain.

Gridley, Charles Vernon, American naval officer: b. Logansport, Ind., 24 Nov. 1845; d. Kobe, Japan, 5 June 1898. A graduate (1863) of the United States Naval Academy, he served during the Civil War in the West Gulf blockading squadron, subsequent to the war was on various ships, and in 1875–79 was stationed at the Naval Academy. He was navigation officer in the Boston Navy Yard in 1882–84, was lighthouse inspector in 1887–91 and 1895–97, in 1897 attained the rank of captain and was ap-

pointed to the command of the Olympia, then flagship of the Asiatic squadron. This vessel he commanded in the battle of Manila Bay 1 May (1898). He died at Kobe.

Gridley, Richard, American soldier: b. Boston, Mass., 3 Jan. 1711; d. Stoughton, Mass., 20 June 1796. He served in the British army as lieutenant-colonel of engineers under Pepperell at the capture of Louisburg in 1745; as chief engineer and colonel of infantry in 1755; took part in the expedition to Crown Point under Winslow in 1756; under Amherst in 1758; and under Wolfe at Quebec in 1759. He was appointed chief engineer and commander of the artillery of the American army upon the outbreak of the Revolution, constructed the fortifications on Breed's Hill before the battle of Bunker Hill, and later fortified Dorchester Heights. He was commissioned major-general by Congress on 20 Sept. 1775, and commanded the Continental Artillery till November of that year.

Grieg, Edvard, ĕd'värd grēg, Norwegian composer: b. Bergen 15 June 1843. His great-grandfather, Alexander Greig, was a Scotchman who emigrated to Norway after the battle of Culloden (1745) and changed his name to Grieg. Edvard's father was British consul at Bergen; he married the Norwegian Gesine Judith Hagerup, a descendant of Kjeld Stub; from her, Edvard inherited his musical gifts; she was a good musician and gave him lessons. By the advice of Ole Bull, Edvard was sent to the Leipsic Conservatory at the age of 15; he remained there three years, studying with Plaidy, Wenzel, Moscheles, E. F. Richter, Hauptmann, Reinecke. Their lessons, and the music he for the most part heard and studied, impressed a German stamp on his mind, which characterizes his first compositions. His studies were interrupted by an illness, a severe case of pleurisy, which destroyed one of his lungs and left his health impaired for life. On his return to the North he came under the influence of three Scandinavian musicians: the composer Gade, who gave him many useful hints; Ole Bull, an ardent musical patriot, who made him familiar with the charming folk-tunes of Norway, which he played so entrancingly; and Richard Nordraak, who encouraged him in his natural inclination to get out of the maelstrom of German music and steer into the fjords of Norway. From 1866 to 1873 he lived at Christiania, conducting the Philharmonic concerts and giving lessons. He also gave subscription concerts, with the aid of his cousin, Nina Hagerup, whom he married on 11 June 1867; she was an excellent vocalist, whose art was a great aid in winning favor for his songs. In 1868 Liszt accidentally came across Grieg's first violin sonata (Op. 8), and was so much impressed by the evidence of creative power it gave that he invited him to come and spend some time in his studio. It was in consequence of this flattering letter that the Norwegian Government gave Grieg a sum of money which enabled him to visit Rome. There he repeatedly met Liszt, who became more and more impressed by the boldness and the national traits of his genius; he urged him to persevere in his original course and not to let the critics intimidate him.

In 1874 Henrik Ibsen asked Grieg to write the music for a stage version of his 'Peer Gynt.' The offer was accepted and the play was produced, with much success, in 1876. It is often given in Scandinavian cities; elsewhere it has not succeeded, because of its untheatrical, fantastic character and its grotesque local coloring; but the music, arranged for the concert hall in the form of two suites, soon made Grieg one of the most popular composers in all countries. In the same year that Ibsen invited him to compose the music for 'Peer Gynt,' the Norwegian Government honored him with an annuity of 1600 crowns for life. This relieved him of the drudgery of teaching and enabled him to devote most of his time to composing. For several years he lived at Lofthus, on the Hardanger Fjord. At Bergen, 1880–1882, he conducted a musical society called the 'Harmonien.' In 1885 he built the elegant villa Troldhaugen, overlooking the fjord, about 8 kilometres from Bergen; there he has lived ever since. After his fame was well established, about 1880, he left his home frequently for concert tours in Germany, France, and England. Everywhere he was acclaimed as one of the most individual and enchanting of pianists (he played only his own pieces), and usually all the seats for his concerts were sold long before their dates. Sometimes he conducted his orchestral compositions. "How he managed to inspire the band as he did and get such nervous thrilling bursts and such charming sentiment out of them I don't know," wrote Sir George Grove, in 1888. In 1893 a writer in the Paris Figaro said: "Among the most famous living musicians there is none I know of whose popularity equals, with us, that of M. Grieg." In 1899, Colonne invited him to Paris to conduct a Grieg concert; but it was just after the verdict in the Dreyfus case, which had made Grieg so indignant that he refused the invitation. When it was repeated, four years later, he accepted. There was a tremendous crowd; cries of "apologize, you have insulted France!" were heard; but the vast majority was with him, and the concert proved one of his biggest triumphs.

Grieg has done for Norway what Chopin did for Poland, Liszt for Hungary, Dvorák for Bohemia; he has created a new national art. This great achievement, unfortunately, stood in the way of the full recognition of his superlative genius. It is still commonly assumed that he did little more than transplant to his garden the wild flowers of Norwegian folk-music, whereas, in truth, ninety-five hundredths of his music is absolutely his own. He ranks with Schubert and Chopin both as a melodist and a harmonist. His persistent ill-health prevented him from writing operas and symphonies; most of his works are songs and short pianoforte pieces. The songs, 125 in number, are of striking originality and depth of feeling. The equally numerous short pieces for piano (including 66 "lyric pieces" in one vol.) are as idiomatic as Chopin's. There are also 5 sonatas: one for piano alone, three with violin, one with 'cello, beside a string quartet. The orchestral list includes: Overture, 'In the Autumn'; 'Holberg' suite; 2 'Peer Gynt' suites; 'Sigurd Jorsalfar'; arrangements of Grieg songs and Norwegian dances. Choral works: 'At the Cloister Gate'; 'Landsighting'; 'Olaf Trygvason.' 'Berg-

liot' is a poem for declamation, with orchestra. The only books on Grieg and his works are by Schjelderup, in Norwegian, and by the author of this article, in English. The latter contains a list of pamphlets and magazine articles on Grieg.

Henry T. Fink,
Musical Director, New York Evening Post.

Griesbach, Johann Jakob, a noted German New Testament scholar, biblical critic and theologian: b. Butzbach in Hesse-Darmstadt, 4 Jan. 1845; d. Jena, 24 March 1812. He was educated at Frankfort-on-the-Main; later studied theology at Tübingen, Halle, and Leipzig; during 1769–70 traveled extensively in England, France and Holland; in 1771 became docent and in 1773 professor extraordinary in theology at Halle; and from 1775 till his death was professor ordinary at Jena. Griesbach's most important work — to which he devoted the best years of his life — was the collecting and classifying of the ancient manuscripts and versions of the Greek text of the New Testament. His critical researches, the result of which appeared in his edition of the Greek New Testament (Halle, 1775–7) one of the first ever printed, are valuable and in the main correct. It was he who first divided the authorities for the text of the Greek New Testament into the three great families — Alexandrine, Latin or Western, and Byzantine or Eastern.

Griffin, Charles, American soldier: b. Licking County, Ohio, 1826; d, Galveston, Texas, 5 Sept. 1867. He was graduated at West Point (1847) and served through the Mexican War. In the Civil War he commanded the 5th artillery at the first battle of Bull Run, and on 6 May 1864 was brevetted lieutenant-colonel in recognition of gallant and meritorious services in the field. He was one of the commissioners to carry out the condition agreed upon by Gens. Grant and Lee.

Griffin, Gerald, Irish novelist; b. Limerick, Ireland, 12 Dec. 1803; d. Cork, 12 June 1840. He will be longest remembered for his novel 'The Collegians' (1829), upon which Boucicault's popular play, "The Colleen Bawn," is founded. Griffin was a poet as well as a writer of tales and the author of various lyrics popular with his countrymen.

Griffin, Sir **Lepel Henry,** English diplomatist: b. 1840. He entered the Bengal Civil Service in 1860 and since then has been administrator of the civil government in several places, especially in the Punjab. In 1885 he was nominated by Lord Salisbury's government as Envoy Extraordinary to Pekin. He has written 'The Punjab Chiefs' (1865); 'The Rajahs of the Punjab' (1870); 'The Great Republic' (1884).

Griffin, Ga., city, county-seat of Spalding County, on the Southern and the Central of G. R.R.'s. It is the centre of a cotton and fruit region, the chief fruits being grapes and peaches. The city contains cotton-mills, a foundry, and furniture factories; wine is also manufactured. The State Agricultural Experiment Station is located in the vicinity. Pop. (1900) 6,857.

Griffin, or **Gryphon,** in mythology, a fabulous animal, usually represented with the body and legs of a lion, and the head and wings of an eagle, signifying the union of strength and agility. Figures of griffins are frequently used as ornaments in works of art. It is employed as an emblem of vigilance, the animals being supposed to be the guardians of mines and hidden treasurers. Figures of it are met with in tombs and sepulchral lamps, as guarding the remains of the deceased.

Griffis, William Elliott, American clergyman and author: b. Philadelphia 17 Sept. 1843. He was graduated from Rutgers College in 1869, and 1870 went to Japan to organize schools after American methods in the province of Echizan, made a study of the Japanese feudal system, and was professor of physics in the Imperial University in 1872–74. In 1874 he returned to the United States, where he was graduated from the Union Theological Seminary in 1877. He was pastor of the First Reformed Church, Schenectady, N. Y. (1877–86), of the Shawmut Congregational Church, Boston (1886–93), and of the First Congregational Church of Ithaca, N. Y. (1893–1903). In 1891 he was a delegate to the International Congregational Council at London. From 1903 he turned his attention wholly to literary work. An authority on Japan, he also studied the Dutch origins of America and the influence of the Dutch in the formation of the United States. His published works include 'The Mikado's Empire' (1876), his best known volume, which has appeared in many subsequent editions; 'Japanese Fairy World' (1880); 'Corea: the Hermit Nation' (1882); 'Corea, Without and Within' (1884); 'Matthew Gailbraith Perry: a Typical American Naval Officer' (1887–90); 'The Lily Among Thorns' (1889); 'Honda the Samurai' (1890) 'Sir William Johnson and the Six Nations' (1891); 'Japan in History, Folklore and Art' (1892); 'Brave Little Holland' (1894); 'Townsend Harris: First American Envoy in Japan' (1895); 'The Romance of Discovery' (1897); 'The Pilgrims in their Three Homes' (1898); 'The Romance of American Colonization' (1898); 'The Romance of American Conquest' (1898); 'The American in Holland' (1899); 'The Pathfinders of the Revolution' (1900); 'In the Mikado's Service'; 'A Maker of the New Orient'; 'Sunny Memories of Three Pastorates' (1903).

Griffiths, Arthur George Frederick, English soldier and author: b. Poonah, India. He served in the Crimean War, was inspector of prisons 1878–96, edited 'The Fortnightly Review' (1884), and is editor of 'The Army and Navy Gazette.' He is the author of 'The Queen's Shilling' (1872); 'Memorials of Millbank' (1875); 'Lola: a Tale of the Rock' (1878); 'Chronicles of Newgate' (1883); 'A Prison Princess' (1890); 'Secrets of the Prison House' (1893); 'Criminals I Have Known' (1895); 'The Rome Express' (1896); 'Wellington and Waterloo'; 'Mysteries of Police and Crime' (1898); 'A Girl of Grit' (1898); 'Ford's Folley, Ltd.' (1899); 'The Brand of the Broad Arrow' (1900); 'A Set of Flats' (1901); 'A Duchess in Difficulties'; 'Tales by a Government official'; etc.

Griffon, or **Bassett-griffon**, a large grayish-red field-dog, combining the qualities of both pointer and setter, but having a thick hard coat enabling it to work readily in thickets and rough country. It originated in Germany at the end of the 19th century.

Griggs, Edward Howard, American lecturer: b. Owatonna, Minn., 9 Jan. 1868. In 1889 he was graduated from Indiana University (Bloomington), and later studied at the University of Berlin, and was successively instructor in English literature and professor of literature in Indiana University. Subsequently he became professor of ethics, and upon the combining of the departments, professor of ethics and education, in the Leland Stanford, Jr., University. From 1899 he was active as a public lecturer, particularly in connection with the courses of the Brooklyn (N. Y.) Institute of Arts and Sciences. He wrote 'Moral Education' (1905).

Griggs, John William, American politician: b. Newton, N. J., 10 July 1849. He was graduated at Lafayette College in 1868, and was admitted to the bar in 1871, practising in Paterson, N. J. He was a member of the New Jersey General Assembly, 1876–77; a state senator, 1882–88; and president of the state senate in 1886. He became governor of New Jersey 1 Jan. 1896, resigning 31 Jan. 1898 to become attorney-general in President McKinley's cabinet. He resigned in April, 1901.

Grijalva, Juan de, hoo-än' dā grē-häl'vä, Spanish navigator: b. Cuellar 1489 or 1490; d. Nicaragua, 21 Jan. 1527. He was intrusted by his uncle, Don Diego Velasquez, the first governor of Cuba, with the command of a fleet of four vessels, which, on 1 May 1518, sailed from St. Jago de Cuba, to complete the discoveries which Fernandez de Cordova had made in Yucatan the year preceding. Rounding the peninsula of Yucatan, he extended his explorations as far as the province of Panuco, giving his name and that of his companion, Alvarado, afterward famous in the expedition of Cortes, to two rivers on the coast. His communication with the Aztecs was friendly, and so profitable that he was enabled to send back one of the ships well freighted with gold, jewels, and other treasures, the acquisition of which was one of the main objects of the expedition. On his return to Cuba he found an expedition organizing for the conquest of Mexico, with Cortes at the head, and was received by Velasquez with reproaches for having neglected to plant colonies on the coast. Grijalva, a man of integrity and prudence, had, however, acted strictly in conformity with his instructions, and against his own judgment. In the latter part of his life he settled in Nicaragua, and was slain in an outbreak of the Indians in the valley of Ulancho.

Grillparzer, Franz, fränts grĭl'pärt-sĕr, German poet and dramatist: b. Vienna 15 Jan. 1791; d. there 21 Jan. 1872. In 1813 he entered the service of the imperial court, retiring to private life with the title of Hofarth (court councillor), in 1856. In 1861 he was appointed member for life of the imperial council. He became known as a dramatist in 1816 by his 'Ahnfrau,' a tragedy of the fatalistic school, which still keeps the stage. It was followed by the dramas 'Sappho' (1819); 'Das Goldene Vliess' (1822); 'Des Meeres und der Liebe Wellen' (1840), an adaptation of the legend of Hero and Leander. Perhaps the finest of Grillparzer's products is the historical drama of 'König Ottokar's Glück und Ende' (1825).

Grilse, a young salmon (q.v.).

Grimes, James Wilson, American politician and legislator: b. Deering, Hillsboro County, N. H., 20 Oct. 1816; d. Burlington, Ia., 7 Feb. 1872. He was graduated at Dartmouth College (1836), and went west, where he began the practice of the law, was appointed secretary of a commission instituted to negotiate the transfer of lands from the Sac and Fox Indians, and after the organization of Iowa Territory in 1838, he was elected to its legislature. He was elected governor of Iowa in 1854, and after completing his term, was sent to Congress as a Republican Senator. He voted for the acquittal of President Johnson at his impeachment trial.

Grimké, grĭm'kė, **Archibald Henry,** American lawyer: b. Charleston, S. C., 17 Aug. 1849. He was graduated from Lincoln University in 1870, from the Harvard Law School in 1874, and in 1883–85 was editor of the 'Hub,' a Boston newspaper. In 1891–92 he was a special writer for the Boston *Herald* and *Traveller*, and in 1894–98 United States consul at Santo Domingo. His writings include a 'Life of William Lloyd Garrison' (1891), a 'Life of Charles Sumner' (1892), and numerous contributions in periodicals, dealing chiefly with various questions pertaining to the American negro.

Grimké, Thomas Smith, American lawyer and scholar: b. Charleston, S. C., 26 Sept. 1786; d. near Columbus, Ohio, 12 Oct. 1834. He was graduated at Yale College in 1807, studied law at Charleston and rose to eminence at the bar and in the politics of his State. He became widely known by his addresses in behalf of peace, religion, and literature. An early and prominent advocate of the American Peace Society, he held the opinion that even defensive warfare is wicked. Though a superior classical scholar, he maintained that neither the classics nor mathematics should enter into any scheme of general education in this country. In some of his pamphlets he introduced a new system of orthography of the English language. A volume of his addresses was published at New Haven in 1831.

Grimké Sisters, The, Sarah Moore, and Angelina Emily: b. Charleston, S. C., 1792 and 1805; d. Hyde Park, near Boston, 1873 and 1879. They were sisters of Thomas Smith Grimké (q.v.). They liberated their slaves, removed to Philadelphia, entered the Society of Friends, and became known in connection with the Anti-slavery movement. They went to New York in 1836 and in the year following to Boston; were leaders in the American Anti-Slavery Society, and appeared as platform speakers on slavery. In 1854 they established a successful coeducational academy at Eagleswood (near Perth Amboy), N. J. Sarah lectured also on woman's rights. Angelina wrote 'An Appeal to the Christian Women of the South'; Sarah an 'Epistle to the Clergy of the Southern States.'

Grimm, Jakob Ludwig, yä'kōb lood'vĭg grĭm, German philologist: b. Hanau, Hesse-Cassel, 4 Jan. 1785; d. Berlin, 20 Sept. 1863. In 1806 he became librarian to Jerome Bonaparte, king of Westphalia, and from 1816 to 1829 occupied the post of second librarian at Cassel. From 1830 to 1837 he resided at Göttingen as professor and librarian, lecturing on the German language, literature and legal antiquities. Hav-

ing, with six other professors, resisted the unconstitutional encroachments of the King of Hanover, he was banished, and after his retirement to Cassel, he was, in 1841, called to Berlin as a professor and member of the Academy of Sciences. He sat in the National Assembly of 1848, and in that of Gotha in 1849. From that time till his death, he occupied himself only with his various publications. He wrote on German mythology, German legal antiquities, the history of the German language, and published old German poems, etc. His two greatest works, both unfinished, are his 'Deutsche Grammatik' (1819–37), and his 'Deutsches Wörterbuch' commenced in 1852, in conjunction with his brother Wilhelm (q.v.), and gradually completed by eminent scholars. He also published, in company with his brother, the 'Kinder und Hausmärchen,' one of the most popular collections of juvenile fairy tales.

Grimm, Wilhelm Karl, vĭl'hĕlm kärl, German philologist: b. Hanau, 24 Feb. 1786; d. Cassel, 16 Dec. 1859. He was the companion in study of his brother, Jakob Grimm (q.v.), at the Lyceum of Cassel, the University of Marburg, and again at Göttingen, where in 1830 he was appointed under-librarian and supernumerary professor of philosophy. He joined his brother in the protest against the King of Hanover, shared his exile, and also his call to Berlin. There they labored together, and were commonly known as the Brothers Grimm. Under that name also they have a certain immortality in the affections of the civilized world. His earliest independent work was a German translation of the Danish 'Kœmpe-Viser' (1811–13). He edited many old German texts and collaborated with his brother Jakob in several of his works. His own most important book is 'Die deutsche Heldensage' (1867), and 'Kleinere Schriften,' (1881–86).

Grimm's Law is the name given to the rule which regulates the *Lautverschiebung*, or permutation of certain primitive consonants, which takes place in the Teutonic languages. The law, as finally formulated by Jakob Grimm, is that if the same roots or words exist in Sanskrit, Greek, and generally in Latin, Celtic, Lettic, and Slavonic, and also in Gothic, English, Dutch, and other Low German dialects on the one hand, and in Old High German on the other, the following correspondences are to be expected: (1) Gothic has a soft mute. and High German a hard mute, in place of the corresponding aspirate in Sanskrit and Greek; (2) Gothic has a hard mute, and High German an aspirate, in place of the corresponding soft mute in Sanskrit and Greek; (3) Gothic has an aspirate, and High German a soft mute, in place of the corresponding hard mute in Sanskrit and Greek. Thus, a primitive *th* becomes *d* in Low German, and *t* in High German, as in the words *th*ugatēr, *d*aughter, *t*ochter. A primitive *d* becomes *t* in Low German, and *z* in High German, as in *d*uo, *t*wo, *z*wei; or *d*ens, *t*ooth, *z*ahn; or *d*ecem, *t*en, *z*ehn. A primitive *t* becomes *th* in Low German, and *d* in High German, as in *t*res, *th*ree, *d*rei; or *t*u, *th*ou, *d*u; or *t*enuis, *th*in, *d*ünn. Similar changes affect the labials and gutturals, as in *p*ecus, *f*ee, *v*ieh; *p*ater, *f*ather, *v*ater; *f*agus, *b*eech. *p*uocha; and in oculus, eg*h*e («eye»), auge; *q*uis, *w*ho, *w*er; or *kh*ortos, garden, *k*orto. The normal changes are set forth in the following table:

	Labials			Dentals			Gutturals		
Greek, etc.........	p	b	ph	t	d	th	k	g	kh
Gothic, etc.........	f	p	b	th	t	d	(h)	k	g
Old High German..	b(v)	f	p	d	z	t	g(h)	ch	k

The credit of the discovery of the *Lautverschiebung* is not wholly due to Jakob Grimm. Ihre and Rask had discovered, as early as 1818, the law of the transmutation of consonants in Greek and Gothic, while Grimm, in the second edition of his 'Deutsche Grammatik'; which appeared in 1822, added the corresponding changes in Old High German, and formulated the law as it now stands.

Grimm's Law may be interfered with by the action of other laws, especially by the position of the accent, as formulated in Verner's Law (q.v.). Thus *fráter* is accented on the first syllable and *patér* on the second, consequently, though we have *brother* and *father* in English, we find *bruder* and *vater* in High German. The accent in *patér* has interfered with the regular action of the *Lautverschiebung*, and prevented the normal change of *t* to *d* from taking place.

Thus Grimm's Law may be defined as the statement of certain phonetic facts which happen invariably unless they are interfered with by other facts. The great use of Grimm's Law, in addition to the identification of words in different languages, is in the detection of loan words. Any etymology which violates Grimm's Law, as qualified by other phonetic laws, must be rejected unless it can be explained as a loan word.

The causes which brought about the changes formulated in Grimm's Law are obscure. They are probably due to the settlement of Low German conquerors in central and southern Germany.

See Douse, 'Grimm's Law: a Study of Lautverschiebung' (1876), Max Müller, 'Lectures on the Study of Language,' 2d series, lecture v. (1864), Morris, 'Historical Outlines of English Accidence,' chap. ii. (1872).

Grimsel (grĭm'zĕl) **Pass,** a mountain pass in the Bernese Alps, leading from Meiringen, canton of Bern, to Obergesteln, canton of Valais. It was in this pass that the French repulsed the Austrians in 1799.

Grim'shaw, Robert, American engineer: b. Philadelphia, Pa., 25 Jan. 1850. He is lecturer in the Franklin Institute of his native city and has done much literary work. He has published: 'Saws' (1880); 'Steam-Engine Catechism' (1887); 'Records of Scientific Progress' (1891); 'Hints to Power Users' (1891); 'Fifty Years Hence' (1892).

Grim'thorpe, Edmund Beckett Denison, Lord, English barrister and author: b. Carlton Hall, Nottinghamshire, England, 12 May 1816; d. 29 April 1905. He took much interest in architecture, and designed many churches and houses, but he will be longest remembered for his restorations and rebuildings at St. Albans Cathedral, works which were carried out at his own expense, but from their iconoclastic character met with almost universal disapproval from architects and excited much discussion both in England and America. His works include: 'Origin of the Laws of Nature' (1879); 'A Book on Building' (2d ed. 1880); 'Should the Revised New Testament be Authorized?'

(1882); 'Astronomy Without Mathematics' (7th ed. 1883); 'Treatise on Clocks, Watches, and Bells' (7th ed. 1883).

Grinding, a mechanical process in which certain effects are produced by the attrition of two surfaces. This process is of extensive use in various mechanical arts, as in grinding corn, ores, colors, in which cases the object is to reduce the materials by crushing to a fine powder; or in grinding the metals, glass, and other hard substances for the purpose of giving them a certain figure or polish, or a sharp cutting edge. In the first case the grinding or crushing is effected by passing the material between rough stones, as in the common flour-mill, or as in crushing ores between heavy metal cylinders, smooth or fluted, according to the degree of fineness required, or by a heavy stone or iron cylinder revolving upon a smooth plate. Chicory, chocolate, plumbago for pencils, and a variety of other substances are ground by iron or stone rollers, revolving on a slab in such a manner that they not only merely roll but also rub on the surface of the slab. A knife or scraper follows one roller and precedes the other, scooping the paste into the position required to come fairly under the roller which follows it. Colors are ground in small quantities with a muller and slab. The muller is a heavy piece of stone of conical shape, and which rests its base on the slab and is grasped by the hands; the color is mixed to a pasty consistence with the desired medium of oil or water, and rubbed between the two surfaces until smooth and impalpable. The grinding of cutlery and tools is effected by means of the grindstone; glass lenses and metal specula are ground to shape with emery-powder laid on a metal tool. Ornamental glass is ground into facets or otherwise by means of stones and lap-wheels. Diamonds and other precious stones are cut or ground with diamond dust embedded in soft iron. Large flat surfaces are obtained by first working two pieces of the material nearly flat and then laying the one upon the other and grinding their surfaces together with sand, emery, or other cutting powder. Plate-glass is flattened in this way; also surfaces of cast-iron, where accurate fitting is required. Sockets and other bearings which require to be fitted with great nicety are usually finished by being ground together. For brass or bell-metal pumice-stone is employed in such cases, as emery is apt to embed itself in the metal and give it a permanent abrading action on the bearings. Dry grinding is the term applied to the grinding of steel with dry grindstones. The points of needles and forks are produced by this means, also the finishing of steel pens and the surface of gun barrels. The men and women engaged on this kind of work suffer painfully from irritation of the throat and nostrils caused by the fine, dust-like particles that fly off from the work. These difficulties have been mitigated in recent years by the use of mouth-pieces of damp cloth, and the provision of air-blasts to dispose of the dust. Sand-jet grinding is a remarkable process, in which abrasion is effected by the percussion of small hard particles on a plain surface. Sharp silicious sand, varying in hardness and fineness according to the kind of work to be done, is employed in most cases. This sand is impelled by a blast of steam or of air. A hole 1½ inch in diameter by 1½ deep, has been bored through a solid piece of corundum (the hardest mineral known except the diamond) in 25 minutes by sand driven with steam-power at 300 pounds pressure on the square inch. A diamond has been sensibly reduced in weight, and a topaz altogether dissipated by a sand-jet in one minute. These results are obtained by causing a sand-stream to mix with a steam jet. The sand passes through a central tube, and the steam through an annular tube which surrounds it; a kind of suction acts at the end of the concentric tubes, which draws the sand into the steam jet, and both dash with great force against the stone or other substance to be acted upon, which is placed at about an inch from the mouth of the tube. By the use of flexible jointed connecting tubes the jet can be turned in any direction, and grooves, moldings, letters, etc., can be produced instead of merely straight cuts or cavities. By using an air jet instead of steam, and varying the pressure, a design can be engraved on glass, the parts not to be acted upon being covered with the pattern, made of paper, lace, india-rubber, or oil-paint.

Grindstone Island. (1) A small island lying off the southeastern coast of New Brunswick, Canada, at the head of the Bay of Fundy It has a number of sandstone quarries, from which a fine quality of sandstone is exported, chiefly to the United States, for the manufacture of grindstones. (2) One of the most important of the Magdalen Islands, belonging to Quebec, in the gulf of St. Lawrence, northeast of New Brunswick.

Grinnell, grĭn-ĕl', **George Bird,** American writer and ornithologist: b. Brooklyn, N. Y., 20 Sept. 1849. He has been an editor of 'Forest and Stream' from 1876. His works deal principally with Indian life and folklore and among them are: 'Pawnee Hero Stories and Folk Tales' (1889); 'The Story of a Prairie People'; 'The Story of the Indian' (1895); 'The Indians of To-day' (1900); 'Jack Among the Indians' (1900).

Grinnell, Henry, American patron of arctic exploration: b. New Bedford, Mass., 1799; d. New York, 30 June 1874. In 1828 he settled in New York and amassed a fortune in business as a ship-owner. This gave him an opportunity to fit out at his own expense the ship which in 1850 sailed from New York in search of Franklin. He also bore a large part of the expense of Kane's arctic voyage (1853–55), as well as of the later American expedition under the command of Hayes and Hall. In recognition of his services to geographical science the American Geographical Society elected him their president and the coast which stretches to the north of Smith Sound was named Grinnell Land.

Grinnell, Josiah Bushnell, American clergyman and politician: b. New Haven, Vt., 22 Dec. 1821; d. Marshalltown, Iowa, 31 March 1891. After studying at Auburn Theological Seminary, he entered the Presbyterian ministry and held pastorates successively at Union Village, N. Y., Washington, D. C., and New York. In 1854 he founded the Congregational Church in Grinnell, Iowa, a town named for him, and preached there several years. Later he became known as a wool grower, sat in the Iowa senate 1856–60, and in Congress as a Republican 1863–67. He frequently aided fugitive slaves and at one time a reward was offered for his head on this account by slave-holders. He gave

much assistance to Grinnell University, of which he was president, and laid out five Iowa towns. He was the author of 'The Home of the Badgers' (1845); 'Cattle Industries of the United States' (1884).

Grinnell, Iowa, city in Poweshiek County; on the Chicago, R. I. & P., and the Iowa C. R.R.'s; 115 miles west by north of Davenport. It is the principal trade centre for the county, and manufactures flour, carriages, gloves, and some farming implements. It is the seat of the Iowa College, founded in 1848 and under the auspices of the Congregational Church. In 1882 the city was nearly swept away by a cyclone. Pop. (1900) 3,860.

Grinnell Land, a large tract of land in the Arctic Ocean, separated from Greenland by Kennedy and Robeson channels. The northern part of the explored portion is called Grant Land and the southern part Ellesmere Land. The coast is irregular, and the interior is hilly. The climate of the valleys is mild in summer; in many places there is no snow for several weeks, and vegetation grows rapidly. The fox, wolf, musk-ox, ermine, and hare are found in quite large numbers. Lieut. De Haven, an American, in charge of the Grinnell expedition in search of Sir John Franklin, first saw this land 22 Sept. 1850 and named it after Henry Grinnell (q.v.). Eight months later it was visited by Capt. Penny of the British vessel, Lady Franklin. He not knowing of the previous visit called the country Prince Albert Land. A British expedition under Narses visited it 25 years after De Haven, Greely in 1881, Lockwood in 1882, and Peary in 1898–99.

Gripe. (1) A brake applied to the wheel of a crane or derrick; it generally consists of an iron hoop under the control of a lever, and is drawn closely around the wheel to check its motion. (2) As a nautical term: (a) The fore-foot of a ship, on to which the stem is fastened; the forward end of the keel. It is scarfed to the stem piece and false keel, and is secured by a horseshoe or ring to the stem. (b) A broad plait of rope or bars of iron, with lanyard rings and claws, passing over a large boat, and by which it is secured to the ring bolts of the deck. (c) One of a pair of bands passing round a boat near the stem and stern when suspended from the davits, to prevent the boat from swinging about.

Grippe. See INFLUENZA.

Griqualand (grē'kwa-lănd) **East,** a district of Cape Colony, Africa, lying south of Natal, between Pondoland and Basutoland; area, 7,594 square miles. The capital is Kokstad. Pop. (1891) 152,618.

Griqualand West, a district of Cape Colony, Africa, bounded north by Bechuanaland, east by the Orange River colony, south by Orange River, and west by Orange River and Bechuanaland; area, 15,197 square miles. It is noted for its diamond fields which in 1870 began to attract people from other countries. The country was then claimed by the Orange Free State and by Waterboer, the Griqua chief. In 1871 Waterboer ceded all his rights to the British government, and in 1876 the Orange Free State relinquished all claim for the sum of about $440,000. In 1880 Griqualand West was incorporated as a part of Cape Colony. The chief centre of the diamond mining industry is Kimberley (q.v.), the capital. Pop. (1891) 83,375. Consult: 'Statesman's Year Book'; Reports (British) 'On the Cape and Griqualand West Diamond Mining;' Reunert, 'Diamonds and Gold in South Africa'; Williams, 'The Diamond Mines of South Africa' (1902).

Gris'com, John, American educator: b. Hancock's Bridge, Salem County, N. J., 27 Sept. 1774; d. Burlington, N. J., 26 Feb. 1852. After pursuing his studies at the Friends' Academy in Philadelphia, established by William Penn, he took charge of the Friends' monthly meeting school in Burlington, with which he was connected 13 years. In 1807 he removed to New York, and began there a career of 25 years as a teacher. In connection with his school he lectured on chemistry with much success. He took a prominent part in the formation of the society for the prevention of pauperism (1817), of which he prepared the constitution and an elaborate first report on the causes and remedies of pauperism. He was an organizer of the Rutgers Medical College, in which he occupied the chair of chemistry and natural philosophy, and after the suspension of the college was widely known as a general lecturer on those subjects. Horace Mann quoted him as one of the eight educational authorities for the changes which Mann planned to introduce into the Massachusetts school system.

Grisons, grē-zôṅ (German, *Graubünden* or *Bünden*), the largest canton of Switzerland; area, about 2,773 square miles. It is a mountainous country, more than 20 peaks being above 9,000 feet. The valleys are generally narrow, Upper and Lower Engadine are the broadest. Its chief drainage streams are the Inn, branches of the Adige and the Adda, and the Vorder and the Hinter Rhine which have their rise in this canton, and which belong to the Rhine basin. There are a large number of small lakes. Snow rests on the mountains until the last of May and sometimes into late July, but the climate of the valleys is warm or temperate nearly all the year. Agriculture in the valleys and the raising of cattle and sheep on the mountain sides are the chief occupations. Pop. (1900) 104,510.

Griswold, grĭz'wōld, **Alexander Viets,** American Protestant Episcopal bishop: b. Simsbury, Hartford County, Conn., 22 April 1766; d. Boston, Mass., 15 Feb. 1843. After studying for the ministry he was ordained in 1795. He was rector of St. Michael's Church, Bristol, R. I., 1804–30 and of St. Peter's, Salem, Mass., 1830–35. When what was known as the eastern diocese of the Episcopal Church was organized he was consecrated its first bishop in 1811. He published 'The Reformation and the Apostolic Office' (1843). See Stone, 'Memoirs of Bishop Griswold' (1844).

Griswold, John Augustus, American manufacturer: b. Nassau, Rensselaer County, N. Y., 1822; d. 1872. At Troy, N. Y., he was active successively in the hardware, drug, and iron trades, and established the Albany and Rensselaer Iron and Steel Company. He was a leader in the introduction of Bessemer steel manufacture into the United States, and with C. H. Delamater built the Monitor of Civil War fame. In 1855 he was elected mayor of Troy, in 1863 a Democratic representative in Congress, and sub-

sequently was twice re-elected as a Republican. In 1868 he was nominated for the governorship of New York, but defeated by the Democratic nominee, J. T. Hoffman.

Griswold, Matthew, American jurist: b. Lyme, Conn., 25 March 1714; d. there 28 April 1799. Besides being lieutenant-governor of Connecticut 1771–84, he was governor 1784–85 and became judge of the supreme court in 1769. He also presided over the convention which ratified the Federal Constitution.

Griswold, Roger, American politician: b. Lyme, Conn., 21 May 1762; d. Norwich, Conn., 25 Oct. 1812. He was graduated from Yale College in 1780, and afterward studied and entered on the practice of law. He was a member of Congress, 1795–1805, and became judge of the Connecticut supreme court in 1807. He was lieutenant-governor of his native State, 1809–11, and governor 1811–13. He was a son of Matthew Griswold (q.v.).

Griswold, Rufus Wilmot, American author and compiler: b. Benson, Rutland County, Vt., 15 Feb. 1815; d. in New York 27 Aug. 1857. He was apprenticed to the printing trade, but afterward studied divinity and became a preacher in the Baptist Church. He soon became associated in the editorship of literary periodicals in Boston, New York, and Philadelphia, among which were the 'New Yorker,' 'Brother Jonathan,' and the 'New World.' In 1842–43 he edited 'Graham's Magazine,' in Philadelphia, to which he attracted contributions from some of the best writers in the country, and in 1850 projected the 'International Magazine,' published in New York, and edited by him till April, 1852. The works by which he is chiefly known are collections of specimens from American authors, accompanied by memoirs and critical remarks. His published works include: 'Poets and Poetry of America' (1842); 'Prose Writers of America' (1846); 'Female Poets of America' (1849); 'Sacred Poets of England and America' (1849); 'Poets and Poetry of England in the Nineteenth Century' (4th ed. 1854); 'Curiosities of American Literature,' 'Washington and the Generals of the American Revolution,' with Simms, Ingraham, and others (1847), 'Napoleon and the Marshals of the Empire,' with Wallace (1847); 'Republican Court, or American Society in the Days of Washington' (1854). He edited the first American edition of the prose works of Milton (1845), and was one of the editors of the works of Edgar A. Poe, for whose bad repute Griswold's 'Memoir' is partly responsible.

Griswoldville, Battle of. When General Sherman marched from Atlanta to the sea, his right wing, commanded by Gen. Howard, was under instructions to threaten Macon and strike the Savannah Railroad at Gordon, about 20 miles east. Upon his arrival at Clinton, the cavalry advance made a demonstration on Macon, and 21 Nov. 1864, his entire cavalry force took up an advanced position covering all the roads to Macon, and that day and the next all the troops and trains were closed up toward Gordon, except C. R. Woods' division, which was directed to take up a strong position on the Irwinton road and demonstrate on Macon and Griswoldville, eight miles east. The demonstration was made on the 22d by Walcutt's brigade of 1,513 men and two guns, in co-operation with Kilpatrick's cavalry on the different roads. Some of Kilpatrick's cavalry were in advance of Walcutt and were fiercely attacked by Wheeler; but with Walcutt's assistance Wheeler was driven from the field, and followed by Walcutt beyond Griswoldville. Walcutt was then recalled to a position a little east of Griswoldville, where two miles in advance of his division, he formed line along a slight rise of ground, with his flanks well protected by swampy ground, and with an open field in front. Kilpatrick's cavalry was on either flank. Walcutt had scarcely thrown up a rail barricade, in view of another attack of Wheeler's cavalry, when he was fiercely assailed by infantry. That morning, under Gen. Hardee's order, Gen. G. W. Smith, in command of a considerable body of Georgia militia that had been concentrated at Macon, directed Gen. Phillips, with a division of infantry and a battery, to march from Macon to Gordon and take trains for Augusta. Phillips had been instructed to halt before reaching Griswoldville and wait for further orders, and was cautioned not to engage an enemy if met, but to fall back to the fortifications at Macon. But when he heard of Walcutt's position he moved through Griswoldville and, with more courage than discretion, threw his four brigades against Walcutt, at the same time opening destructively with his artillery. At 2 o'clock, in three compact lines, his militia charged to within 75 yards of Walcutt's line, and were repulsed. The assaults were repeated in front and on both flanks, and continued until sunset, when, everywhere repulsed, he abandoned the field, leaving his dead and wounded. During the action Walcutt was severely wounded by a piece of shell. The Union loss was 13 killed, 69 wounded, and 2 missing. The Confederate loss was 51 killed and 472 wounded. Consult: 'Official Records,' Vol. XLIV.; Cox, 'The March to the Sea'; the Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. Carman.

Griv'et. See Green Monkeys.

Groesbeck, groos'běk, **William Slocomb,** American politician: b. New York, 1815; d. 1897. He was graduated from Miami University, Oxford, Ohio, in 1835, studied law and began practice at Cincinnati. In 1851 he was a member of the Ohio State constitutional convention, and in 1852 a member of the commission appointed for the codification of the State laws. From 1857 to 1859 he was a Democratic representative in Congress, in 1872 was nominated for the Presidency by the Liberal Republicans but met no recognition in the ensuing campaign, and in 1878 was United States delegate to the International Monetary Congress at Paris. He defended Andrew Johnson in the latter's impeachment trial (1868).

Groin, the region where the front of the thigh joins the body. The abdominal muscles end below in a strong tendon which makes a fold across the front of the bony pelvis. The large nerves, arteries, and veins pass through folds of this ligament, and portions of the abdominal contents in case of rupture pass into the scrotum or form a tumorous swelling in the groin.

Gronlund, grŏn'lŭnd, **Lawrence,** American socialist: b. in Denmark 1847; d. 1899. He studied in the University of Copenhagen, in 1867 came to the United States, practiced law for a time, but became a writer and speaker on socialism. Among his publications are 'The Coming Revolution' (1880), a forecast of the peaceful changes which he believed might be effected by a national organization operating in every community; 'Ça Ira,' a rehabilitation of Danton (1888); and 'The New Economy' (1898).

Gronovius, grō-nō'vĭ-ŭs (properly GRONOV, grō'nōv), the name of several Dutch classical scholars:

(1) JOHANN FRIEDRICH, yō'hän frēd'rih: b. Hamburg 8 Sept. 1611; d. Leyden, 28 Dec. 1671. He studied at Leipsic and Jena, and law at Altdorf, was appointed professor of history and eloquence at Deventer (1642), and, after the death of Heinius, succeeded him as professor of belles-lettres at Leyden (1658). His editions of Livy, Statius, Justin, Tacitus, Aulus Gellius, Phædrus, Seneca, Sallust, Cicero, Terence, Pliny, and Plautus, 'Observationes' (1639), and edition of Hugo Grotius' work, 'De Jure Belli et Pacis' (1642) are justly valued on account of the notes.

(2) JAKOB, yä'kōb, son of the preceding: b. Deventer, 1645; d. Leyden, 21 Oct. 1716. He studied at Deventer and Leyden, and published, in 1676, an edition of Polybius, which met with great applause. He received from the grand duke of Tuscany a professorship at Pisa, which he relinquished in 1679 to become professor of Greek literature and history at Leyden. This learned critic edited Tacitus, Polybius, Herodotus, Pomponius Mela, Cicero, Ammianus Marcellinus and other classical writers, and compiled the valuable 'Thesaurus Antiquitatum Græcarum' (1698–1702). He also promoted the publication of the collections of Grævius. He was a violent controversialist.

Groot, grōt, **Groete,** or **Groote, Gerhard** or **Gerardus,** founder of the Brothers of the Common Life (q.v.): b. Deventer 1340; d. there 20 Aug. 1384. Educated at Paris, he there became a teacher, later took deacon's orders and was successful as a traveling preacher. He advocated general reading of the Scriptures, assembled a company for the preparation of copies of the Bible, and thus began the formation of the Brothers of the Common Life. To this order, which obtained papal sanction in 1418, belonged Thomas à Kempis (q.v.). Groot was the author of several works.

Gros, Antoine-Jean, äṅ-twän zhŏṅ grō, BARON, French historical painter: b. Paris 16 March 1771; d. near Paris, 26 June 1835. At 14 he became a pupil of David, and in 1794 left Paris for Rome. His means, however, were not sufficient for the journey, and he had to depend on what he could earn as a portrait-painter in the various towns he passed through. At Genoa, in 1796, he was drawn for the French army, and soon became a staff-officer. Josephine, afterward empress of France, saw and admired several portraits by the young officer, and he was called upon to paint that of Bonaparte. The result was a picture representing Napoleon leading his troops over the bridge of Arcola. In 1804 he produced his 'Peste de Jaffa,' considered by many to be his masterpiece. He painted the 'Bataille d'Aboukir' (1806); 'Bataille d'Eylau' (1808); 'La Prise de Madrid,' 'Wagram,' and 'La Bataille des Pyramides' (1810). In France his chief work is considered by some to be the cupola of St. Geneviève at Paris, exhibiting the saint protecting the throne of France, represented by Clovis, Charlemagne, St. Louis, and Louis XVIII. This picture covers an immense space, and is correct in design but defective in color and expression. The artist received for it 100,000 francs and the title of baron. The rise of the romantic school bore away from him the tide of popularity, and his last work 'Hercule et Diomède,' was a failure. Adverse criticisms upon it brought on a fit of despondency and he drowned himself in the Seine.

Gros Ventres, grō väntr (Fr. «big bellies»). (1) The Minnetari or Hidatsa Indians, on the Missouri River. (2) A band of the Arapaho, who separated from the main body about 1800: the name was a misunderstanding of their own term, which meant «hungry men» or «beggars.» After conflicts with the Sioux, and being plundered by the Crows, whom they had joined, they settled among the Blackfeet near Milk River about 1824; prospered, and were very hostile to the whites. About 1830 they had some 400 lodges and 3,000 souls. But about 1866 they were decimated by the measles, and thus weakened, received a terrible defeat from the Piegans; reduced to about 1,300 by smallpox in 1870, they were plundered and many killed by the Sioux. Later they were joined by the main body of Arapaho and Cheyennes. In 1868 they were settled among the Blackfeet in Montana.

Grosbeak, grōs'bēk, any of various birds whose beaks seem disproportionately large. They are mainly finches such as the hawfinch and bullfinch in Europe, and their relatives in the Orient. Bird-dealers call «grosbeaks» a great number of African, Asiatic and American line cage-birds, some of which are weaver-birds, or tanagers, etc. The term is more exactly given to certain North American fringilline birds with big swollen bills, such as the cardinal (q.v.), the evening grosbeak (q.v.), and the pine, blue, rose-breasted, and black-headed grosbeaks. The pine grosbeak (*Pinicola enucleator*) is a greenish yellow finch which dwells exclusively in the coniferous forests of northern Europe and America, and is only seen in the United States when forced southward by hard winters; it feeds on the seeds of the pine, spruce, etc., wrenching open the cones with its powerful beak. The blue grosbeak (*Guiraca cærulea*) is a large, richly blue southern and western bird, nearly related to the indigo-finch, which makes its nest in a bush, and lays pale blue eggs, wholly unmarked. The rose-breasted and black-headed grosbeaks represent the genus *Zamelodia*, the former (*Z. ludoviciana*) in the Eastern States, and the latter (*Z. melanocephala*) in the Rocky Mountain region. Both are birds of brushy places, making large, rude nests in bushes and laying greenish, heavily marked eggs; and in the breeding-season both are among the loudest and most brilliant of American song-birds. As in nearly all the grosbeaks the females of these species are inconspicuous in brown tints, while the males are dressed in gay colors. The male rose-breasted has the head, neck and upper parts mostly black, with the rump, wings, tail and abdomen, white; while the breast and lining of

the bend of the wing are exquisite rose-red, which the bird is fond of displaying. The male black-head has a wholly black head and upper parts, set off by a collar and other marks of dull orange, which color also suffuses the whole lower parts.

Grose, grōs, **William**, American soldier and politician: b. Dayton, Ohio, 1812; d. 1900. He resigned his position as judge of the court of common pleas in 1861 to recruit and take command of the 36th Indiana regiment of infantry, and commanded a brigade in the battles of Murfreesboro, Chickamauga, and Chattanooga. He was commissioned brigadier-general 30 July 1864 and at the battle of Nashville, 15 and 16 Dec. 1864, he commanded the Third brigade in General Thomas's army. In 1865 he was brevetted major-general of volunteers. He was State senator from 1879 to 1883.

Gross, grōs, **Charles**, American historian: b. Troy, N. Y., 10 Feb. 1857. After graduating from Williams College in 1878, he pursued his studies at Göttingen, and was engaged in literary work in England 1884–87. Since 1888 he has been instructor and professor of history at Harvard University. A frequent contributor to the 'American Historical Review' and other historical journals, he has published: 'Gilda Mercatoria' (1883); 'The Exchequer of the Jews of England in the Middle Ages' (1887); 'The Gild Merchant' (1890); 'Select Cases from the Coroner's Rolls' (1896); 'Bibliography of British Municipal History' (1897); 'Sources and Literature of English History' (1900). In addition he has translated: Lavisse's 'Political History of Europe' (1891); Kayserling's 'Christopher Columbus' (1893).

Gross, Samuel D., American physician and surgeon: b. Northampton County, Pa., 8 July 1805; d. 6 May 1884. He began the practice of medicine in Philadelphia, devoting his leisure to study and to the translation of French and German medical works. His first original work was a treatise on the 'Diseases and Injuries of the Bones and Joints' (1830), in which occurs the first account of the use of adhesive plaster as a means of extension in the treatment of fractures. In 1835 he became professor of pathological anatomy in the medical department of the Cincinnati college, where he delivered the first systematic course of lectures on morbid anatomy that had ever been given in this country, and composed the first systematic treatise upon the subject ever published in the United States, 'Elements of Pathological Anatomy (1839). In 1840 he became professor of surgery in the University of Louisville. Besides the works already mentioned, he was the author of a monograph on 'Wounds of the Intestines' (1843); 'Diseases, Injuries, and Malformations of the Urinary Organs' (1851); 'Foreign Bodies in the Air Passages' (1854); 'System of Surgery, Pathological, Diagnostic, Therapeutic, and Operative' (2 vols. 1859).

Grosse, Julius Waldemar, German poet, dramatist, and novelist: b. Erfurt, Prussia, 25 April, 1828; d. 1902. After obtaining his education at Halle, he entered the field of journalism, for 16 years (1854–70), being associated with the *Neue Münchener Zeitung* (afterward known as the *Bayrische Zeitung*), and in 1870 becoming secretary of the Schiller-Stiftung, at Weimar. His writings are various, including novels, dramas, epics, songs, and ballads, the most important of which are his war songs, 'Wider Frankreisch' (1870); 'Das Volkramslied' (1889); 'Gundel von Königssee,' and 'Das Mädchen von Capri,' all epic poems; 'Pesach Pardel' (1871); 'Hilpah und Shalum,' and 'Der Wasunger Not' (1872), comic epics; the dramas, 'Tiberius' (1875), and 'Fortunat' (1895); the novels, 'Ein Revolutionär' (2d ed. 1871), and 'Tante Carldora,' and several tales and romances, among which is 'Die Novellen des Architekten' (1896).

Grosseteste, Robert, English Roman Catholic prelate: b. Stradbrook, Suffolk, about 1175; d. Buckden, 9 Oct. 1253. He studied law, physics, and theology at Oxford and Paris, and, upon his return to England, attained an enviable reputation as a theologian, so much so that in 1214 he became archdeacon of Wifts, and in 1224 received the directorate of theology and became first *rector scholarum* of the Franciscan school at Oxford. In 1232 he took up the cause of the Jews against the king, defending them with great vigor, and in 1235 was elected Bishop of Lincoln, whereupon he undertook to make radical changes in his diocese and eliminate some of the many abuses prevalent there, the result of which was that though he was possessed of great force of character, his high temper and lack of tact and diplomacy led him into innumerable controversies. The most famous of these was with Pope Innocent IV., who, desiring to fill the lucrative positions in the church with Italians and Provençals, in 1253 sent the Bishop a request that he appoint his (the Pope's) nephew to the first vacant canonry in the cathedral of Lincoln. This Grosseteste flatly refused to do, and, as his clergy stood by him in his fight against this abuse, the matter was finally dropped and it is mainly upon this incident that his fame rests. He was, though, a man of great scholarly attainments, Hebrew, Latin, Greek, French, mathematics, medicine, and music being numbered among them, beside which he was one of the most learned preachers of his time and a voluminous writer. Consult: Perry, 'Life' (London 1871); Luard (editor), 'Roberti Grosseteste Episcopi quondam Lincolniensis Epistolæ' in the Rolls Series (1862).

Grossi, Tommaso, Italian poet and novelist: b. Belluno, on the Lake of Como, 20 Jan. 1791; d. Milan, 10 Oct. 1853. He studied law at Pavia and settled in Milan, where he passed the remainder of his life as a notary, but his political ideas prevented his rise in his profession. His first attempt at poetry was 'La Principe,' written in the Milanese dialect, and this was followed in 1816 by two shorter poems, 'La Fuggitiva' and 'La Pioggia d'Oro,' and in 1820 by 'Ildegonda,' a romance in verse. This poem became popular and set the fashion for that style of writing, the success which it attained encouraging him to write 'I Lombardi alla Prima Crociata' in 1826, a poem remarkable for its patriotic sentiment. Despite the fact that Manzoni gives praise to this last poem in his novel 'I promessi sposi,' and that the cost of printing was defrayed by a generous subscription, it was soon forgotten. This did not dishearten him, however, and in 1834 he published his 'Marco Visconti,' which at once excited public approval and became the pioneer of the

historical novel in Italy. His only other work of note was 'Ulrico e Lida,' published in 1837.

Grosso, Matto, mä'tō grō'sō, Brazil (q.v.), a western central state bordering on Bolivia, Argentina, and Paraguay. It has an area of 532,500 square miles and an estimated population in 1900 of 157,000. Capital Cuyabá (q.v.).

Grosvenor, grō'vē-nôr, **Edwin Augustus,** American educator and author: b. Newburyport, Mass., 30 Aug. 1845. He was graduated at Amherst College in 1867 and at Andover Theological Seminary in 1872, was professor of history at Roberts College, Constantinople, in 1873–90; and of European history at Amherst College in 1892–9. In 1899 he was appointed to the newly established chair of modern governments and their administration. His publications include translations from the French of Victor Duruy's 'Modern Times' (1894) and 'General History' (1898); 'The Hippodrome of Constantinople' (1889); 'Constantinople' (1895); 'The Permanence of the Greek Type' (1897); and 'Contemporary History' (1899), extending from 1848 to the present time.

Grote, George, English historical writer: b. Clayhill, Kent, 17 Nov. 1794; d. London, 18 June 1871. After having studied at the Charterhouse, in 1809, he became a clerk in his father's banking house. He kept on with his studies, particularly with philosophy, and his liberal trend of thought gradually drew him into politics. He had written and spoken much in favor of the Reform Bill which was passed in 1832, and in that year he was elected to the House of Commons from London, which seat he continuously occupied until 1841. During all these years he had steadily worked upon his 'History of Greece,' the idea of which was suggested to him by the spirit of partiality displayed in Mitford's 'History of Greece' and which he had severely criticised in an article in the *Westminster Review* (April 1826). He had as early as 1823 devoted himself to the study of Greek history, for a sympathetic interpretation of which his extreme liberality made him admirably suited, and though to a certain extent the spirit of democracy is evident in the 'History of Greece,' yet the facts are placed before the reader with the idea that he will form his own conclusion. His private and public duties had prohibited literary work and it was not until he retired that he completed the first two volumes which appeared in 1845, the last volume of the set, the twelfth, appearing in 1856. Grote also wrote 'Plato and the Other Companions of Socrates' (3 vols., 1865); 'Minor Works,' edited by Alexander Bain (London 1873), and 'Aristotle,' which he left unfinished (2 vols., 1872). He had taken an active interest in educational matters, in 1860 becoming vice-chancellor of the London University, and in 1869 president of the University College, and also was elected a trustee of the British Museum. Consult: Mrs. Grote, 'Memoirs' (London, 1873); Alexander Bain, 'Character and Writings of G. Grote,' prefixed to his 'Minor Works' (London, 1873).

Grotefend, Georg Friedrich, German archæologist and philologist: b. Münden, near Cassel, Prussia, 9 June 1775; d. Hanover, 15 Dec. 1853. He received his early education at Hanover and Ilfeld, and completed his studies at the University of Göttingen (1795–7). He became prorector and later conrector of the gymnasium at Frankfort-on-the-Main (1803–21), and for nearly 30 years (1821–49) was director of the lyceum at Hanover. His research in the field of Latin philology was of great value, but his importance is chiefly due to the fact that he first deciphered the old Persian inscriptions of Persepolis, presenting the results of his labors in a paper before the Academy of Science at Göttingen, 4 Sept. 1802. Chief among his publications are: 'Rudimenta linguæ Umbricæ' (1835–8); 'Neue Beiträge zur Erläuterung der babylonischen Keiliuschrift' (1840); 'Zur Geographie und Geschichte von alt-Italien' (1840–2); 'Rudimenta Linguæ Oscæ (1839), etc.

Grotius (gro'chi-us), or De Groot, Hugo, Dutch scholar and statesman: b. Delft 10 April 1583; d. Rostock 28 Aug. 1645. He was a pupil of Joseph Scaliger at the University of Leyden, conducted his first lawsuit in his 17th year; and in his 24th was appointed advocate-general. In 1613 he became syndic, or pensionary, of Rotterdam. In 1615 he was sent to England in order to arrange the difficulties arising from the claims of the English to exclude his countrymen from the Greenland whale-fishery. He declared himself on the side of Barneveldt (q.v.) in the struggle between the Remonstrants and their opponents, and was sentenced to imprisonment for life in the fortress of Loevenstein. He succeeded in escaping by concealing himself in a chest, and after wandering about for some time in the Catholic Netherlands escaped to France, where Louis XIII. gave him a pension of 3,000 livres, withdrawn in 1631. He returned to Holland, but by the influence of enemies, was condemned to perpetual banishment. He later went to Hamburg, and in 1634 to Stockholm, where he was appointed counsellor of state and ambassador to the French court, in which post he remained for ten years. On his return to Sweden by way of Holland he met, in Amsterdam, with a distinguished reception. Most of his enemies were dead, and his countrymen repented of having banished the man who was the honor of his native land. With the talents of the most able statesman, Grotius united deep and extensive learning. He was a profound theologian, excellent in exegesis, his 'Commentary on the New Testament' being still esteemed; a distinguished scholar, an acute philosopher and jurist, and a judicious historian. His writings have had a decisive influence on the formation of a sound taste, and on the diffusion of an enlightened and liberal manner of thinking in affairs of science. As a critic and philologist he seizes the genius of an author with sagacity, illustrates briefly and pertinently, and amends the text with facility and success. His metrical translations from the Greek are executed with the spirit of a poet. Among the modern Latin poets he holds one of the first places, and he also tried his powers in Dutch verse. But the philosophy of jurisprudence has been especially promoted by his great work on natural and national law, 'De Jure Belli et Pacis,' which represented the study of twenty years and laid the foundation of the new science of international law; besides which he wrote 'Annales et Historiæ de Rebus Belgicis' (1657); 'Annotationes in Vetus Testamentum'

(1644); 'Annotationes in Novum Testamentum' (1641-46). 'De Veritate Religionis Christianæ, and Poemata' (1617). See Butler, 'Life of Hugo Grotius' (1826); Hély, 'Etude sur le Droit de la Guerre et de la Paix de Grotius' (1875).

Gro'ton, Conn., town in New London County; on the Thames River, the New York, N. H. & H. railroad; opposite New London. In 1637 Capt. Mason stormed the fortress held by the Pequots, and many lives were lost, both whites and Indians. A more disastrous fight occurred here 6 Sept. 1781, when 800 British troops under Benedict Arnold attacked Fort Griswold (q.v.), which was garrisoned by 150 soldiers. The Americans heroically resisted, but were overwhelmed by numbers, and Arnold and his force entering the fort butchered 85 men and wounded 65. Soon after 35 of the 65 died from the effects of their wounds. This battle is known in history as the "Massacre of Fort Griswold." Groton contains ship-building yards, several manufactories, and the Bill Memorial Library. Consult: Caulkins, 'The Stone Records of Groton' (1903); 'History of New London County'; 'Magazine of American History,' 'The Massacre of Fort Griswold.'

Grouchy, groo-shē, **Emmanuel,** Marquis de, French marshal: b. Paris 23 Oct. 1766; d. St. Etienne 29 May 1847. He acquired distinction in the revolutionary armies, and in the campaign of 1800 fought in the army of the Rhine under Moreau, and rendered important service at the battle of Hohenlinden. In the war with Prussia in 1806, and with Russia in 1807, he acquired new fame, and was sent to the army of Italy under Prince Eugene. At the battle of Wagram his masterly manœuvres contributed greatly to the victory. On the restoration he was banished, but allowed to return in 1815. On Napoleon's return from Elba he immediately joined him, was made a marshal, and obtained first the command of the army of the Alps, and then the command of the cavalry in the grand army. After the battle of Ligny he was sent on the following day with 34,000 men and 100 cannon to follow the retreat of the Prussian army under Blücher. While he here on the 18th engaged with Thielemann, Napoleon gave battle at Waterloo, the disastrous issue of which has been sometimes laid to Grouchy's charge, from having failed to observe how three divisions of the Prussian army were advancing to Waterloo to take Napoleon in flank and rear, while Thielemann alone remained at Wavres. Being again banished, he came to the United States, where he lived five years, but was permitted to return in 1819. After the July revolution he was elected to the chamber of deputies by the department of Allier, supported the new dynasty, and was appointed in 1831 marshal, and in 1832 a peer.

Ground Beetles. The family *Carabidæ,* predatory beetles of various sizes and appearance. It contains upwards of 1,200 described species, nearly all of nocturnal habit, and, consequently, dark, mostly black in color. Some species, however, are metallic green or blue, or beautifully variegated. The family contains many beneficial species, which roam fields, meadows and gardens, destroying many injurious pests. They fly freely at night, and seek concealment in the daytime under stones and logs and in other convenient hiding-places. Most species are terrestrial, but a few forms, such as species of *Calosoma,* known as 'caterpillar-hunters,' climb the trunks of trees in search of noxious caterpillars which they destroy. A remarkable genus is that of the bombardier beetles (q.v.). A very few are occasionally injurious, among them *Agonoderus pallipes,* which burrows into newly planted seeds of corn; and two species of *Harpalus* which are destructive to strawberries. These latter insects are interesting because of their dual habit of being carnivorous as well as herbivorous. They attack, in the beetle stage, the seeds of Ambrosia, and also eat insects of various kinds.

Ground-cherry, herbaceous plants of the potato family, constituting the genus *Physalis,* scattered through most of the world. About 35 species are natives of the United States, and some are known as 'tomato strawberries,' and are cultivated for the sake of their berry-like fruit, which is hidden within a persistent red calyx.

Ground Cuckoo, a coucal (q.v.).

Ground-dove, any of various species of pigeons which live mainly on the ground and seek their food there. The name is especially given to the genus *Columbagallina,* small birds of the warmer parts of America, of which one gentle and familiar species (*C. passerina*) is well known in the South Atlantic States, along the coast. The bronze-wing pigeons of Australia, and the large pigeons of the genus *Goura* (q.v.) are also so called.

Ground Ivy, a familiar European labiate plant (*Glechoma hederacea*), allied to mint, with a creeping stem and purple flowers. The leaves are crenate-reniform and the flowers are in threes. It was formerly employed to flavor ale and also medicinally.

Ground-nut, a climbing plant (*Apios apios*) of the pea family, which puts out dense clusters of dull purple flowers after most other plants have stopped blooming; these are velvety within and sweetly fragrant. The tuberous rootstock is edible, whence the name.

Ground-rent, in law, is the rent paid to the landlord by a person for the use of ground on which he intends to build. The usual arrangement is for a specified time, generally for a period of ninety-nine years. On the expiry of this period the whole of the building becomes the property of the ground-landlord. The ground-landlord is able, when his rent is in arrear, to distrain all the goods and chattels found on the premises, to whomsoever they may belong; and as the ground-rent is generally a small sum compared with the furniture of a tenant, he is always certain of recovering its full amount. This power of distress exists whether the tenant has paid his house-rent to his landlord or not, but the tenant may deduct the amount from the next rent he pays. See Landlord; Rent; Tenant.

Ground-sloths, a family (*Megatheriidæ*) of extinct edentates, related to the modern sloths, but of terrestrial habits, and, in respect to many of them, of gigantic size, which are of special interest because some survived into the human period. They exhibit the head and teeth of a sloth, associated with the vertebræ, limbs and tail of an ant-eater. They were chiefly South American, but spread as far as North America

in the Pliocene and Pleistocene epochs, and became extinct in very recent, but probably prehistoric times. *Megatherium* (q.v.) is the largest and most familiarly known genus; it almost equalled an elephant in size, and surpassed one in its massive proportions. *Lestodon, Mylodon* (q.v.), *Scelidotherium*, and *Megalonyx*, were smaller but more common forms. The discovery of part of the hide of one of these animals, genus *Glossotherium*, in a cave at Last Hope Inlet, Patagonia, showed that their skin was thick, studded with small embedded bony nodules, and thickly covered with long, coarse, yellowish-brown hair, as well preserved as are the feathers of the moas in New Zealand. The skin, says the discoverer, Dr. Moreno, of Buenos Ayres, shows patches of red color, suggesting of course blood-stains; and when small bits were chemically analyzed they yielded serum and the substances of glue. In view of this it seems impossible to believe that the skin can be of any great age, for bacteria would have finished their work upon the serum and gelatine long ago. An equally fresh-looking skull was found, as though in a small stone enclosure, and wounded in such a way as only man could have inflicted; and there are legends among the Indians that such creatures were known to their ancestors. Dr. Moreno is of the opinion, from evidences found in this cave and elsewhere, that these animals had been domesticated by man, but to what extent and for what purposes is unknown.

Consult Beddard, 'Mammalia' (1902), where further references are cited.

Ground-snake, one of the little, burrowing worm-shaped snakes of the genus *Carphophiops*, which abound in tropical America. One species (*C. amœnus*) is numerous under stones and logs in the Southern States, and is glistening chestnut in color above and salmon-yellow beneath. A larger, more purplish species (*C. vermis*) is called "ground-worm" in Louisiana. These snakes are perfectly harmless, and are the least specialized of the *Colubridæ*.

Groupers (Anglicized form of Spanish name "Garrupa"). Tropical and semi-tropical sea-bass of the genera *Epinephelus, Promicrops, Mycteroperca* and their allies. All are valuable food-fishes and most of them of large size, bright coloration and high quality as game-fishes. About a dozen species enter the waters of the Southern States or California, the most common along the Atlantic coast being the red grouper (*E. morio*), called "Cherna" and by many other local names. It is a large fish (20 to 40 pounds), is particularly abundant on the west coast of Florida, keeps near the bottom and is a voracious carnivore, consuming large quantities of small fishes, as well as crabs, etc. It is a favorite with market-fishermen, because it bears so well the hardships of transportation. The yellow-finned grouper or rockfish (*M. venenosa*); yellow grouper (*M. olfax*); and black grouper of the Florida Keys (*M. bonaci*), are also large and important; while another black grouper (*Promicrops*) is the famous jewfish (q.v.) of sportsmen. Several other species are elsewhere described under particular names, as CABRILLA, MERO, SCAMP, etc. Consult 'American Food and Game Fishes,' by Jordan and Evermann (New York 1902).

Groups, Theory of. Everywhere in mathematics are encountered systems of *operations*, possessing definite laws of combination. Thus, two geometric motions compound into a single motion, two algebraic transformations into a single transformation, under laws as definite as the primordial 2×2 of arithmetic but otherwise capable of infinite variety of simplicity and intricacy. Consider, for example, the 12 rotations of a regular tetrahedron into itself. Any two of these rotations compound into a third one among them, easily identified on a model. By a simple convention, these various combinations can be registered in algebraic form. The several rotations may be designated by the marks $a, b, c, \ldots$; the symbol ab may indicate that a is followed by b, and at the same time designate their resultant effect. This resultant ab is called the *product* of a and b in the order written; it is itself one of the 12 rotations, say c, and we write $ab = c$. It is an instructive exercise to tabulate the products of two or more of the 12 rotations, identifying each product with one of the 12 original rotations. It is possible to express all the 12 rotations as products of two of them, say of the rotation a through 120° about an axis through one of the four vertices of the tetrahedron and the rotation b through 180° about an axis joining the middle points of two opposite edges. It may be noted that the products ab and ba are here not the same rotation: a and b are not *commutative* as in ordinary algebra. On the other hand aa, which is a rotation through 240° about the axis of a, is conveniently denoted by a^2; a^3 and b^2, both of which restore every point to its initial position, may appropriately be equated to 1 (identity), which is included among the 12 rotations. The three rotations b_1, b_2, b_3 about the (trirectangular) axes joining the middle points of opposite edges of the tetrahedron will be found to be commutative; in fact $b_1b_2 = b_2b_1 = b_3$, $b_2b_3 = b_3b_2 = b_1$, $b_3b_1 = b_1b_3 = b_2$; $(b_1^2 = b_2^2 = b_3^2 = 1)$.

The tetrahedral rotations furnish a simple instance of an *algebra of operations*. Any system of operations possesses such an algebra, of greater or less extent. And as many different systems of operations, taken from widely separated mathematical fields, often present one and the same algebra, these algebras are worthy of study by themselves, as generalizing and unifying instruments. Since each algebra is completely defined by the laws of combination of the symbols $a, b, c, \ldots$, we may abstract the idea of operation entirely and deal with the pure algebra. This position having been reached, it is inevitable to the mathematical mind to reverse the order of thought and to devise algebras *à priori*, leaving their concrete interpretation for secondary consideration. In constructing such algebras, choice among the infinite possibilities will be dominated by the two principles of generality and usefulness. The two qualities are combined in high degree in the algebra of *groups*.

Definition of Group.—A system of symbols, or *elements*, $a, b, c, \ldots$ (finite or infinite in number), conceived as capable of multiplication with each other, is said to form a *group* if the following conditions are fulfilled:

(1). The product of any two elements of the system is a third element of the system.

(2). The multiplication is associative: $(ab)c = a(bc)$, (but not necessarily commutative: ab and ba need not be equal).

(3). Equalities $ab = ab'$ or $ab = a'b$ require $b = b'$ or $a = a'$, respectively.

(Conditions (2) and (3) evidently hold for any ordinary kind of *operations;* (1) traces a significant boundary).

The *order* of a group is the number n of its elements. A group is briefly called finite or infinite, according as its order is finite or infinite.

The defining conditions (1)–(3), classic in their simplicity, possess a most extraordinary fecundity. From them alone proceed, by pure logical deduction, the vast and intricate systems which make up the algebra of groups.

As a primary deduction it may be noted that every finite group G contains one and only one element, identity (denoted by 1), such that for every element x of G $1x = x1 = x$. A proper power x^m of any element x of G is equal to this element 1; the lowest exponent m for which this is true is called the order of x; every power of x is equal to one of the m powers $x, x^2, x^3, \ldots, x^{m-1}$, 1. The *inverse* x^{-1} of x is defined by $x^{-1}x = 1 = x^{m-1}x$, whence by (3) $x^{-1} = x^{m-1}$; then $x^{-2} = (x^2)^{-1} = x^{m-2}$, etc. The analogy to ordinary algebra (of mth roots of unity) is here perfect. These elementary principles may be illustrated by reference to the tetrahedral group G of order 12 above.

An infinite group does not necessarily contain the element 1 nor the inverse elements. Thus all the motions of a point along a line in *one* direction form an infinite group, but this does not contain the reverse motions nor the case of no motion. The prevailing tendency is, however, to restrict the name group to systems which contain the inverse of their elements, and consequently the element 1.

A part of the elements of a group G, taken by themselves, may form a group H, which is then called a *subgroup* of G. Thus the powers of any element x of G form a cyclical group H which is either G itself or a subgroup of G. The tetrahedral group has a subgroup of order 4 composed of b_1, b_2, b_3 and identity. The order h of a subgroup H of G is always a divisor of the order g of G. If p^i, where p is a prime number, is a divisor of g, G has one or more subgroups of order p^i, and the total number of these subgroups is of the form $kp + 1$, where k is an integer. If p^a is the *highest* power of p that divides g, $kp + 1$ is also a divisor of g. These theorems of Sylow and Frobenius are of great assistance in the analysis of groups of finite order. Thus a group of order pq, where p and q are prime numbers, has a single subgroup of order p; it has also a single subgroup of order q, unless p is of the form $kq + 1$. Thus the order $15 = 5.3$ presents only one case, while the order $21 = 7.3$ presents two. For a further example, the icosahedral group of rotations, which is of order 60, contains subgroups of orders, 2, 4, 3, 5, and also 6 and 10. The 15 lines joining middle points of opposite edges of the icosahedron form five sets of trirectangular axes, each of which sets is converted into itself by a tetrahedral group contained as subgroup in the icosahedral group. There are no subgroups of orders 15, 20, or 30 present.

Isomorphism and Transformation.—Groups which have the same algebra are called isomorphic. Written in the same symbols, isomorphic groups are by definition identical. But in the practice the isomorphism requires to be detected, being veiled under dissimilarity of notation. Once detected among groups derived perhaps from quite different mathematical fields, isomorphism constitutes the unifying principle already mentioned. For example, the tetrahedral group is isomorphic with the group of 12 substitutions (rearrangements) which it produces among the four vertices of the tetrahedron; and the icosahedron group is isomorphic with the corresponding group of substitutions of the five trirectangular axis systems mentioned above. These isomorphisms contribute materially to the theory of equations of degrees four and five.

One instance of isomorphism is expressible by a universal formula. Let G be any group, with elements $a, b, c, \ldots$, and let t be any element whatever capable of combination with $a, b, c, \ldots$, under conditions (1)—(3); then the elements $a' = t^{-1}at$, $b' = t^{-1}bt$, $c' = t^{-1}ct, \ldots$ form a group $G'(t^{-1}Gt)$, and this group G' is isomorphic with G. For if $ab = c$, for example, then $a'b' = t^{-1}at \cdot t^{-1}bt = t^{-1}abt = t^{-1}ct = c'$, so that not only a', b', c' form a group, but the algebra of this group is identical with that of G. The process of deriving G' from G is called *transformation* of G by t; G' is called the *transform* of G by t. All transforms of a group G (by $t, s, \ldots$) are isomorphic with G and with each other.

Transformation has a very simple concrete significance. Suppose that G is a group of *operations*, $a, b, c, \ldots$ performed on a field of objects A, and that t converts A into a second field of objects B; then $t^{-1}Gt$, *i. e.*, t reversed, followed by G, followed by t, produces among the objects B an effect precisely parallel to that produced by G on the corresponding objects A. For example, if A is a plane, G a group of operations in A, t a projection of A on a second plane B, then $t^{-1}Gt$ is the projection of the group G on B. Or again, if G is a group of rotations about an axis A, and t a rotation which moves A into the position B, then $t^{-1}Gt$ is a second group of rotations, precisely similar to G, performed about the new axis B. In general, transformation in the present sense is the concomitant, for operations, of transformations in the ordinary sense as affecting objects.

Group Analysis.—If G is any group and H any subgroup of G, all the transforms of H with respect to the elements of G are contained in G. These transforms are called the conjugates of H in G. Thus the subgroups of order 3 of the tetrahedral group are conjugate in that group. A noteworthy general example is that of the subgroups of order p^a (a a maximum) of a group G; these $kp + 1$ subgroups are always conjugate. The number of conjugates of any subgroup H of G is a divisor of g. In the important case where its conjugates all coincide, H is an *invariant* subgroup of G. Every group G has two invariant subgroups, itself and the identical operation. If it has no other invariant subgroups, G is *simple;* otherwise G is *compound.* Thus the four rotations $1, b_1, b_2, b_3$ of the tetrahedral group form an invariant subgroup, this being in fact the only subgroup of order 4, of the tetrahedral group.

A *maximum* invariant subgroup H of G is not contained in any larger invariant subgroup

of G. A *principal series of composition* of G consists of G and a series of subgroups, H, I, J, ..., 1 of G, each of which is a maximum invariant subgroup of the preceding one. The ratios of the orders g, h, i, j, ..., 1 of these subgroups is a principal series of *factors of composition* of G. Apart from their order of succession, these factors of composition remain the same for every principal series of composition of G. They play an important part in the theory of algebraic equations.

Every compound group G is reducible to a sequence of simple groups, whose orders are the factors of composition of G. Only simple groups present new problems. The chief problem of the pure theory of groups is therefore the determination of all simple groups. This problem awaits solution. All groups of prime order are simple. Simple groups of composite order are of rare occurrence, the only cases below order 2000 being one group for each of the orders 60, 168, 360, 504, 660, 1092. The number of different prime factors in the order of a simple group not of prime order is at least three, and the total number of prime factors is at least six (orders 60, 168, 660, 1092 being the only exceptions). No simple groups of odd order have as yet been found. Several series of orders of simple groups are known, for example, $\frac{1}{2}n!(n \neq 4)$, $\frac{1}{2}p^n(p^{2n}-1)$, $(p^n > 3)$, etc.

A group whose elements are commutative is called an *abelian* group. Every subgroup and every element of an abelian group is invariant. The factors of composition are here the prime factors of the order.

Example of Group Construction.—Let a and b be two elements of prime orders p and q $(a^p = 1 = b^q)$ and subject to the further condition $b^{-1}ab = a^i$. We find successively $b^{-1}a^2b = b^{-1}ab \cdot b^{-1}ab = a^i \cdot a^i = a^{2i}$, $b^{-1}a^3b = a^{3i}$ .... $b^{-1}a^jb = a^{ji}$; $b^{-2}a^jb^2 = b^{-1}(b^{-1}a^jb)b = b^{-1}a^{ji}b = a^{ji^2}$, $b^{-3}a^jb^3 = a^{ji^3}$, ..., $b^{-k}a^jb^k = a^{ji^k}$, ..., $b^{-q}a^jb^q (= 1a^j1) = a^j = a^{ji^q}$, ... $i^q \equiv 1 \pmod{p}$. If $p-1$ is not divisible by q, i must be 1, $b^{-1}ab = a$, $ab = ba$, that is, a and b are commutative, and their various products ab form an abelian group of order pq. (This group consists of the powers of one element, say ab.) But if q divides $p-1$, the congruence $i^q \equiv 1$ has roots i different from 1. Any one of these roots i having been chosen, the conditions $a^p = 1 = b^q$, $b^{-1}ab = a^i$ are consistent and lead again to a group of order pq composed of the distinct products a^kb^l; the last group is non-abelian. For $p = 3$, $q = 2$, the second group presents the *multiplication table*

1	1	a	a^2	b	ab	a^2b
a	a	a^2	1	ab	a^2b	b
a^2	a^2	1	a	a^2b	b	ab
b	b	a^2b	ab	1	a^2	a
ab	ab	b	a^2b	a	1	a^2
a^2b	a^2b	ab	b	a^2	a	1

Substitution Groups.—The permutations or *substitutions* of n given letters x_1, x_2, ..., x_n form a group (the symmetric group) of order $n!$. The order of any group of substitutions of n letters is a divisor of $n!$. An individual substitution is written in cycles: thus $(x_1 x_2 x_3)(x_4 x_5 x_6 x_7)$, or simply $(1\,2\,3)(4\,5\,6\,7)$, signifies that x_1, x_2, x_3 are to be replaced by x_2, x_3, x_1, and x_4, x_5, x_6, x_7 by x_5, x_6, x_7, x_4. Every finite group is expressible as (isomorphic with) a substitution group. Thus in the case of the group of order 6 above, if we denote the elements $1, a, a^2, b, ab, a^2b$ for convenience by $x_1, x_2, \ldots, x_6$, the six lines of the table are obtained from the first line by the six substitutions 1, (123)(456), (132)(465), (14)(26)(35), (15)(24)(36), (16)(25)(34), which form a substitution group isomorphic with the original group.

Those substitutions of n letters $x_1, x_2, \ldots. x_n$ which leave a given function of $x_1, x_2, \ldots. x_n$ unchanged in form, form a group. Thus the function $\phi_1 \equiv x_1x_2 + x_3x_4$ is unchanged by the eight substitutions G_1 : 1, (12), (34), (12)(34), (13)(24), (14)(23), (1324), (1423). The substitution t : (23) converts ϕ_1 into $\phi_2 \equiv x_1x_3 + x_2x_4$ and *transforms* the group G_1 of ϕ_1 into the group $G_2 = t^{-1}G_1t$: 1, (13), (24), (13)(24), (12)(34), (14)(23), (1234), (1432) of ϕ_2.

Interesting examples of substitution groups may also be obtained by determining those substitutions of n letters $x_1, x_2, \ldots, x_n$ which transform the substitution $(12\ldots.n)$ into its powers. If n is a prime number, the order of this (metacyclic) group is $n(n-1)$.

For further discussion of substitution groups see the article GALOIS THEORY OF EQUATIONS.

Groups of Linear Transformations.—All the linear transformations of a complex variable z, $z' = (\alpha z + \beta) / (\gamma z + \delta)$, for which $\alpha\delta - \beta\gamma \neq 0$, form a group. For two of them in succession evidently amount to a third linear transformation. Thus $S : z' = 1/z$ and $T : z' = 1 - z$ give $ST : z' = 1 - 1/z = (z-1)/z$, $TS : z' = 1/(1-z)$. The group of all linear transformations of z is both infinite and *continuous*. If $\alpha, \beta, \gamma, \delta$ are restricted to integral values, the resulting group is still infinite but discontinuous. The *modular* group is subject to the still further condition $\alpha\delta - \beta\gamma = 1$; this is the group connecting the values of the ratio ω of the two periods ω_1, ω_2 of the elliptic integral $u = \int (4z^3 - g_2z - g_3)^{-\frac{1}{2}}dz$.

There exist only a finite number of non-isomorphic types of finite groups of linear transformations of z. If z is represented on a spherical surface, every rotation of the sphere produces a linear transformation of z. Those rotations of the sphere which convert into itself a regular solid inscribed in the sphere, or a regular polygon of n sides inscribed in a great circle (equator), form a group. These groups are of orders 60 (icosahedron, dodecahedron), 24 (octahedron, cube), 12 (tetrahedron), $2n$ (dihedron), n (cyclical). They give all the non-isomorphic types of finite groups of linear transformations of z. The octahedral group is also isomorphic with the symmetric substitution group of four letters, the tetrahedral and icosahedral groups with (alternating) substitution groups of four and five letters, respectively.

A simple example of a (dihedral) group of order 6 is generated by the transformations $S : z' = 1/z$ and $T : z' = 1 - z$ above.

The linear transformations of z written in homogeneous form $z'_1 = \alpha z_1 + \beta z_2$, $z'_2 = \gamma z_1 + \delta z_2$ furnish *homogeneous* linear groups. Increasing the number of variables, we arrive at the general homogeneous linear groups $z_1{}^{1'} = a_{11} z_1 + a_{12} z_2 + \ldots. + a_n z_n$, $z_2{}^{1'} = a_{21} z_1 + a_{22} z_2 + \ldots. + a_{2n} z_n$, ... $z_n{}^{1'} = a_{n1}z_1 + a_{n2}z_2 + \ldots. + a_{nn}z_n$ identified, for example, with projective geometry. Curves, surfaces, etc., frequently

have linear transformations into themselves, these always forming a group. Thus a plane cubic curve has in general such a group of order 432. Linear *congruence* groups should also be mentioned. An example is the *simple* group of order $\frac{1}{2}p(p^2-1)$ $(p>4)$ composed of the linear transformation $z' = (\alpha z+\beta) / (\gamma z+\delta)$ when $\alpha, \beta, \gamma, \delta, z', z$ are integers taken mod. p

Continuous Groups.—These are groups of transformations involving continuous parameters, such as the entire group of linear transformations of z, or the entire group of motions in a plane or in space. The theory of these groups, which has been extensively developed by Sophus Lie and his followers since 1870, has important applications to geometry, and especially to the theory of differential equations.

Historical.—The theory of groups was originally developed by Galois, Cauchy, and their successors under the particular guise of substitution groups. It was with Sylow's memoir in the 'Mathematische Annalen,' Vol. V. (1872) that the theory began to assume its independent abstract form. Among those who contributed to this movement are Cayley, Klein, Dyck, and others. But it is to Frobenius, above all others, that we owe the great developments of the pure theory which have been accomplished in the last fifteen years. The theory of group *characteristics*, recently created by Frobenius, is destined to produce brilliant results in the near future.

Other historical elements are traceable in the accompanying bibliography.

Frank Nelson Cole,
Professor of Mathematics, Columbia University.

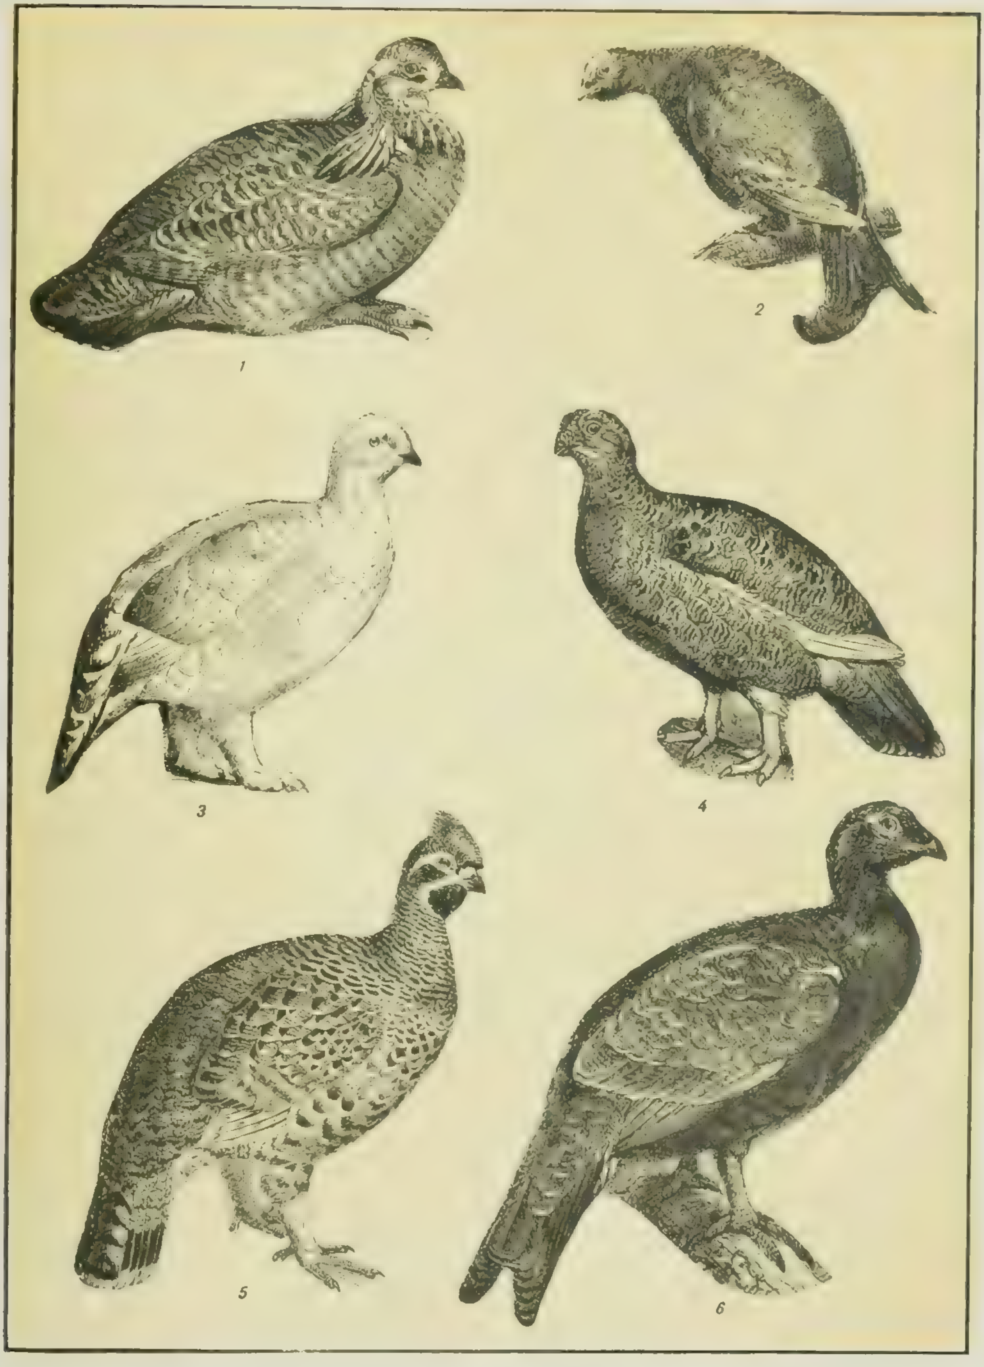
Grouse, a family (*Tetraonidæ*) of gallinaceous game birds with feathered feet or tarsi, inhabitants of the northern hemisphere. In North America our best known species is the ruffed grouse (*Bonasa umbellus*); the "partridge" of New England and the "pheasant" of the Middle States. This bird, in one or other of its races, ranges all across the continent from Canada to Washington and southward in the higher ground, and is one of our best esteemed game birds. The rumbling drumming of the male is a familiar sound in the woods in early spring, and is effected by rapidly beating the wings against the body. On the prairies of the central and western States are several varieties of pinnated grouse or prairie chickens (q.v.). In the northwest occur the blue or dusky grouse (*Dendragapus fuliginosus*) and the sage hen (q.v.). In Canada and the northernmost part of the United States occurs the Canada grouse or "spruce partridge" (*Canachites canadensis*) with the allied Franklin's grouse (*C. franklini*) in the northern Rocky Mountains. The species to which the name grouse was originally applied, namely the red grouse or moorfowl (*Lagopus scoticus*) of England, is the only bird absolutely restricted to the British Isles. It is plentiful in suitable parts of Wales and northern England, but is especially numerous in the highlands of Scotland, where it is bred and preserved on moorlands of great extent, large areas of which are kept barren of other occupation for this purpose. This, then, is the bird whose shooting, permitted for a period following the 12th of August, attracts so large numbers of sportsmen annually to Scotland for the "grouse-shooting." The sport may be followed in the ordinary method of shooting on the wing over dogs; but in many places is conducted as a battue. Grouse-moors are owned and rented in large numbers, and have a status similar to that of deer-forests (q.v.). This grouse is a ptarmigan, other species of which exist in the artic regions (see Ptarmigan). Other European grouse of importance are the blackcock and capercailzie (q.v.). Among works dealing especially with grouse and grouse-shooting are Lloyd, 'Game Birds and Wildfowl of Sweden and Norway' (London, 1867); the volumes on 'Shooting' in the 'Badminton Library' (London, 1889); Alflalo, 'Sport in Europe' (London, 1901); Sandys and Van Dyke, 'Upland Game Birds' in the Sportsman's Library (New York, 1902); Coues, 'Birds of the Northwest' (Washington, 1874).

Grove, Sir **George,** English engineer, author, and musical critic: b. Clapham, near London, 13 Aug. 1820; d. Sydenham 28 May 1900. After completing his studies in the grammar schools of Clapham, he learned civil engineering, and for two years worked in Napier's factory near Glasgow. In 1841 he went to the West Indies, erecting in that year the Morant Point lighthouse in Jamaica, and in 1845 the Gibb's Hill light in Bermuda. He was appointed secretary to the Society of Arts in 1849, and in 1852 to the Crystal Palace. While in the latter position he exerted all his influence toward giving the music-loving public the best music obtainable, and endeavoring especially to create a taste for the compositions of Beethoven and of the German Romantic School. From 1868–83 he was editor of 'Macmillan's Magazine,' and from 1878–89 edited the famous 'Dictionary of Music and Musicians.' In 1882 he was made the first director of the Royal College of Music, at the same time being knighted, and in 1894 was made a Commander of the Bath. He contributed to Smith's 'Dictionary of the Bible' (1864), and to Stanley's 'Sinai and Palestine' (1865).

Grove, Sir **William Robert,** English physicist; b. Swansea, 1811; d. 1896. He was graduated at Oxford in 1832, began the practice of law in 1835, but eventually applied himself to the study of physics. He was elected professor of experimental philosophy to the London Institution, 1840–47, and received the Royal medal from the Royal Society for his paper on the 'Gas Voltaic Battery.' Returning to the law he was knighted and made a judge of the High Court of Justice. He was one of the first to grasp the law of the "conservation of force." He is the author of 'The Correlation of Physical Forces' (1846).

Grove City, Pa., borough in Mercer County, on the Pittsburg, B. & L. E. railroad; 58 miles north of Pittsburg. It is the seat of the Grove City College, a coeducational school opened in 1884. The chief manufactures are

GROUSE.



1. Prairie Hen (Tympanuchus Americanus).
2. Blackcock (Tetrao urogallus).
3. Moor-hen or Ptarmigan (Lagopus albus) in winter dress.
4. Scotch Red Grouse (Lagopus scoticus).
5. Ruffed Grouse (Bonasa umbellus).
6. Hybrid between Blackcock and Capercailzie.

carriages, brooms, gas-engines, and machinery. Pop. 1,615.

Grover, Cuvier, American army officer; b. Bethel, Me., 24 July 1829; d. Atlantic City, N. J., 6 June 1885. He was graduated at the United States Military Academy in the class of 1850, and on the outbreak of the Civil War was appointed captain of the 10th infantry. Returning East, in April 1862, brigadier-general of volunteers, was assigned to duty with the Army of the Potomac, with which he participated in the various battles of the Peninsular campaign in Virginia, and in the second battle of Bull Run. In 1864 he commanded the 19th corps, and in the Shenandoah campaign was engaged in the battles of Opequan, Fisher's Hill, and Cedar Creek. He was mustered out of the volunteer service in 1865, and in 1875 became colonel of the 1st cavalry.

Grover, Lafayette, American politician: b. Bethel, Me., 29 Nov. 1823. He was admitted to the bar in Philadelphia in 1850, and settled in Salem, Ore., in 1851, where he became prominent in his profession, and was made prosecuting attorney of the second judicial district, and auditor of public accounts. In 1853 he was elected to the territorial legislature, serving there three years, and being speaker in his last term (1856). He fought in the Indian wars in 1853 and 1855–6, and was later made United States commissioner to audit spoliation claims. In 1857 he was a member of the Oregon constitutional convention, and when Oregon was admitted as a State, he was member of Congress (1858–9). He was chairman of the Democratic State committee (1866–70); served as governor of the State 1870–7; and was United States senator 1877–83.

Groves. See ASHERA.

Groveton, Va., Battle of. See BULL RUN, SECOND BATTLE OF.

Grow, Galusha Aaron, American statesman: b. Ashford (now Eastford), Windham County, Conn., 31 Aug. 1823. He was graduated from Amherst College in 1844, was admitted to the bar of Susquehanna County, Pa., in 1847, was elected to Congress in 1850, and was six times re-elected, once unanimously, from the same district. During his first three terms he was a Free-Soil Democrat, during the last three a Republican. He was chairman of the committee on the Territories in the Thirty-fourth and Thirty-sixth Congresses, and speaker of the Thirty-seventh Congress, whose five-weeks' session of 4 July — Aug. 6 1861 largely defined the government attitude toward the Confederacy and voted $500,000,000 for war purposes. He introduced the Homestead bill (see HOMESTEAD LAWS) into the House, fought for it 10 years, finally obtained its enactment, and signed it as speaker. In 1879 he declined the mission to Russia, in 1894 was elected from Pennsylvania as congressman-at-large, and was successively re-elected to the Fifty-fourth, Fifty-fifth, Fifty-sixth and Fifty-seventh Congresses. His plurality in 1896 was 297,446, the largest ever given in any State of the United States to a candidate for any office. He was also a delegate to the national Republican conventions of 1864, 1884, and 1892, and chairman of the Pennsylvania State Republican committee in 1868. In 1871–6 he was the president of the International and Great Northern railway company of Texas. His long record of conspicuous service is almost unparalleled in the political annals of the United States.

Growth, increase in size or volume. It may be divided into inorganic and organic growth. As an example of the former is the increase in size of minerals. Living beings or organisms grow by adding to the substances (protoplasm, etc.) forming their bodies similar matters as food, which are digested, assimilated, and thus taken into the body of the plant or animal by interstitial deposit. Organic growth is thus fundamentally a physico-chemical process together with a form of constructive energy as yet quite incomprehensible to us. The result of this absorption of food is that the body increases in size, that is, grows. All growth is attended by movement; and growth-movements are, as Verworn states, common to all living bodies, but they take place so slowly that they can scarcely be followed with the eye. Growth goes on more freely and the size of the body increases most rapidly in those organisms in which the body presents a large raying surface, in distinction from the microscopic bodies of the one-celled plants or animals. The simplest phenomenon of growth is seen in cells, which during growth rapidly multiply by self-division, which causes the increase in volume in the embryo.

The physical agents or factors in the growth of plants and animals are abundance of food, together with the influences exerted by heat, light, etc. During growth the simple molecule of living proteid continually attracts elements to itself from the food (Hatschek). Growth is most rapid in a well-fed plant or animal. The health, size, and stature of children depend on good nutritious plain food and plenty of fresh air.

Food and Chemical Agents.— As digestion and assimilation are chemical processes, they require certain materials to work with. These are called food. The elements which constitute food and which occur in protoplasm and flesh are carbon, oxygen, nitrogen, lime, phosphorus, potassium, sodium, chlorine, magnesium, sulphur, silicon and iron. All or any of these enter the body in various combinations, each playing a definite part in growth. Phosphorus is especially abundant in the tissues of embryos; potassium appears to be of great importance in imbibition, while iron is essential in the early processes of cell-division. Besides these inorganic substances, organic food, as flesh or vegetables, are essential to the growth of animals. Water is also essential, and embryos develop most rapidly in moist places or in water.

Light.— Without light there would be no growth, indeed no life. Light may retard or hasten growth, under different circumstances. Young growing plants and embryos of animals need to be protected from too direct sunlight.

Temperature.— Organisms need sufficient heat in order to grow. The requisite amount for normal, maximum growth is called the optimum temperature, for at such a degree of warmth growth takes place faster than at any other. If the temperature be lowered, the rate of growth gradually diminishes; if the temperature be raised too much above the optimum, the rate of growth diminishes more rapidly. Excess of cold dwarfs both plants and animals.

Space and Movement.— If too much crowded, plants become slender and weak; snails become dwarfed if reared in too small vessels; mankind when confined to too narrow quarters in large cities tend to become undersized, from not having sufficient space and good air to live in; small trout live in small brooks and large ones in larger streams. All organisms need room to move or at least to grow.

Heredity.— Besides the factors already mentioned heredity has its share as an agent. Growth, development and reproduction are now in the plant and animal world proceeding as it were in grooves, or along more or less definite paths, in accordance with long established laws or relations, and the mechanism of growth is subject to heredity.

Growth and Longevity.— The elephant and whale attain a colossal size because they grow throughout life and live long. The large size of man as compared with many other mammals, is due to the fact that he grows for a longer period; while many mammals get their growth in one, two or three years, man does not stop growing until he is thirty.

It is to be observed that individual growth is not only dependent upon a suitable amount of food, but on proper environment and favorable conditions of life, and all these agencies also are the primary factors of organic life. It is the changes in the conditions of life, coupled with heredity and selection, that have caused the evolution of the world of plants and animals. Thus we see that the fundamental causes of the evolution of species are the same as those which determine the growth of any individual organism; we by no means understand all the phenomena of simple growth; there are unexplained laws and causes, as there are in general evolution; both in this respect are of a piece and are similar in their nature and results. The origin of species is as natural a process as the growth of the individual, and both in many respects are alike inexplicable by the science of the present day.

Growth and Development of the Human Being. In this article growth refers to an increase in size, and development to an increase in capacity. The body begins in a microscopic cell, and passes through the various stages of birth, growth, development, decline, and death.

The life of an individual may be studied in various periods, the embryonic and fœtal (which do not concern us at this time) and those of infancy, childhood, youth, maturity, and old age. The above division is convenient, but not physiologically exact. The various periods are not sharply limited. From birth to maturity, with a gradual increase in size of various organs, there are progressive modifications of functions. Toward old age, decline begins and the modifications retrogress.

The Period of Infancy is variously limited by different writers, extending from birth to the end of the fourth, fifth, or even the seventh year, the last considered by law as the beginning of responsible life. Probably the best limitation is from birth to the end of the first dentition, about the end of the second year. At birth, connection with the mother suddenly ceases, and a new existence begins with the first inspiration. Then the vegetative functions, digestion, circulation, respiration, secretion, excretion, and assimilation, are soon established. The infant performs all the functions of adult life except reproduction and volition. But in order to have them at their best they should be intelligently supervised by the parents. The young baby is the most helpless and dependent of all creatures. The care it receives influences its future life. With no care it must perish.

The period of infancy is characterized by frailty, active nutrition, rapid growth, and commencing development. It is especially prone to convulsions from improper food, or from high body temperature, whatever the cause, to rickets and scurvy from improper nourishment, to spasmodic affections such as false croup, to hydrocephalus, meningitis, whooping cough, diphtheria, diarrhœa, bronchitis, pneumonia, and to the eruptive diseases, measles, chicken-pox and scarlet fever.

The rate of infantile mortality is very high. From one fourth to one half of the children born in our large cities die within the first year; in small towns and in the country the rate is much lower. Many of the new-born are enfeebled by vices of formation, such as cyanosis, spina bifida, hydrocephalus, or meningocele, by an hereditary syphilitic, scrofulous, or tuberculous taint, or by chronic affections in the mother. All infants are exposed to the risks of an improper dietary, impure air, and the extremes of heat and cold.

The bones of the infant are very vascular, quite elastic, have but little firmness, and their epiphyses are cartilaginous. They are therefore readily inflamed, as in scurvy, may be distorted by pressure, or incompletely broken by apparently slight injuries, or the epiphyses may be separated by such injuries. To forcibly lift a young child by one arm is always dangerous. The skull at birth is not fully ossified and can be readily compressed. The anterior fontanelle begins to close about the 9th month and is usually closed about the 18th. Depression of this fontanelle is one of the evidences of general debility. Premature closure of the skull is a cause of epilepsy or idiotism. The vertebral column is straight, lacking the curves of later life, and is quite flexible, but this flexibility tends to backward, forward, or lateral distortions of the spine, as the result of rickets, inflammation (caries) of the vertebræ, or of sitting, standing, or reclining in strained positions. Allowing infants (especially feeble ones) to sit, stand, or walk too early tends to produce bow legs and knock knees, as well as spinal deformities. It is many weeks before a baby can hold up its head. Even by the twelfth week it is not properly balanced. It may be at the sixteenth. The first attempt to sit is about the sixteenth week, and sitting is accomplished about the fortieth. About the thirty-eighth week, the child attempts to stand, and should be able to stand alone by the eleventh or twelfth month, and to walk unaided by the fifteenth or seventeenth month. Some children never creep. If they do, the attempt is made about the ninth month.

The muscles of an infant are soft and not capable of great effort. Not till after the sixth month are they felt firm and resisting. To develop them the clothing should be loose, and the child, in a nude state, should at times be allowed free play of them. To swathe the feet and limbs in bandages «to make the child straight» is hurtful.

The abdomen and chest (in its lower portion) are prominent, due to the very large liver, the small pelvis, and the distention of the stomach by food, and to large size of the heart and lungs. All of these organs must have free movement, in order to carry on their important functions. Tight bandaging of chest or abdomen hampers movement and compresses important blood vessels. The size and weight of the heart of the new-born explains the rapid growth of the body and those organs in most direct communication with the heart, especially the brain. The small size and the vertical position of the stomach account for the ease with which infants throw up their food when the stomach is distended. Repeated acts of vomiting are injurious. The practice of jolting babies tends to produce vomiting. Each child must be studied by itself as to its powers of digestion, and what is the proper food for each. The substitution of artificial feeding for maternal nursing, and the indiscriminate use of baby foods are responsible for much sickness and many deaths. But natural feeding is not always possible, owing to the dictates of fashion or the poor health of mother or child.

The nervous system of infants is very excitable, especially toward the end of the first year, and is out of proportion with the slow development of the inhibitory centres. Convulsions and spasmodic affections are therefore readily produced by various causes, such as undigested food, eruptive fevers, impure air, fright, or excessive heat. Most of the movements and actions of early infancy are reflex, such as stretching, crowing, and sighing, for example, About the fourth month evidences of will power appear and gradually increase. Good habits, as to regular times for feeding, sleep, etc., can often be inculcated at this early age, or even before, to the advantage of both mother and child. The brain is relatively large at birth and grows rapidly up to the seventh year, and after that time more slowly.

During this formative period care should be observed not to excite the brain unduly, else nervous disorders may result. Repeatedly urging a young child to "show off" is, to say the least, very unwise.

The senses of taste and smell seem to be partially developed at birth. After the third month the quick closure of the eyes on the approach of an object seems to indicate the establishment of true vision. A very bright light may be appreciated by the second or third day, or may be followed by the eyes, if moved slowly, after the sixth week. It is usually weeks before there are associated movements and convergence of the eyes. The eyes of the new-born frequently move independently of each other, producing "squint," but squinting in the course of a severe disease is a bad sign. As to colors, yellow, red, pure white, gray, and black, in the order named, are said to be the first recognized, gradually after the sixth month.

All children are born deaf, but may notice sharp sounds six hours after birth, though usually not until a number of days. Toward the end of the first year the infant begins to imitate vocal sounds in its attempt to speak.

The circulation of blood is very rapid; the blood vessels are large and thin. Congestions, inflammations, and hemorrhages, therefore, are quite common. The pulse is irritable and slight causes disturb its rate and sometimes its regularity. The rate in the new-born is 130–140, during the first year 105–150 per minute, during the second 110–120, then gradually diminishes until at the fifth year it is about 90; from the seventh to the fourteenth year 80–90, and afterward 70–80. The respirations of the new-born are from 30 to 50 per minute, and at the end of the first year from 25 to 35. The breathing of healthy children is noiseless and through the nose. The habit of mouth breathing usually caused by enlarged tonsils and by adenoid growths, is productive of deafness, change in facial expression and distortion of the chest (pigeon breast). The relatively small size of the pharynx, larynx, and trachea frequently cause throat affections to be serious ailments in infants.

The average temperature of the infant is 100° F., but it is subject to many fluctuations. It is raised by ingestion of food, struggling, crying, etc., and lowered by sleep, inactivity, and insufficient food. Sponging with cool water or oiling the skin will frequently lower a high body temperature, which, if unchecked, might cause convulsions.

In man there are two sets of teeth. The first or temporary teeth are 20 in number, 10 in each jaw. The first tooth appears about the seventh month, the last about the twenty-fourth month. The dangers of dentition are much exaggerated. Well-nourished children of healthy parents cut their teeth earlier, easier, and more regularly than do feeble children. If the first tooth is not cut before the 14th month there is some serious defect. About the 6th year (and before the temporary teeth are shed) the jaws contain all the temporary teeth and all the rudimentary permanent teeth except the wisdom teeth. At birth, when the teeth have not appeared and in old age when they have disappeared the lower jaw is obtuse. During the growth of the teeth, the lower jaw increases in depth and length. To admit of these changes, the temporary as well as the permanent teeth should be taken care of, and filled if need be. Food requiring mastication should not be given until there are several teeth. The permanent teeth are 32 in number, 16 in each jaw. The first one appears about the 6th year, the last from the 18th to the 24th or later. The thymus gland appears in the new-born, attains its full size by the end of the 2d year, then gradually diminishes until at puberty it has almost disappeared. It is supposed to be one of the sources of the red blood corpuscles.

For the first few months of life tears and perspiration are rare. After three months they are freer. In rachitic infants perspiration is often profuse. Up to the end of the first year the sebaceous glands are very active, especially upon the scalp. The saliva and pancreatic juice are small in amount until about the third month and therefore starchy foods cannot safely be given to young infants. The gastric secretion at birth can as a rule readily digest the casein of mother's milk, but has difficulty in disposing of other food. Mucus in the infantile intestines is copious, often ferments and may neutralize the feebly alkaline intestinal juices, and the pancreatic juice and saliva.

Both the small and large intestine are com-

paratively long, and digestion and peristaltic action are rapid. These facts together with the small size of the stomach and the rapid growth of the body, require that the young baby be fed every 2 or 3 hours. The great length of the sigmoid flexure of the colon impedes the passage of fæces and induces constipation, which should be relieved by *light* laxative medicines or, better still, by change in the diet.

The lymphatic glands are numerous and large in the infant and the communication between them and the general system is more marked than at any other period of life. They are readily congested and enlarged in affections of the throat, scalp, etc., and in scrofulous and syphilitic ailments.

The average weight of the male new-born child is 7 lbs. 11 oz.; of the female 7 lbs. 4 oz. For the first few days there is a loss in weight, then the weight gradually increases. Generally it is doubled by the 5th month and trebled by the 12th in breast-fed infants; in hand-fed, later. Usually a healthy child gains 20 lbs. in weight and 10 inches in height in first 2 years of life; in the 3rd year 4 lbs. and 4 inches. During next 6 years there is an annual increase of 4 lbs. and 2 or 3 inches; after the 10th year about 8 lbs. a year. About the 9th year in girls and the 11th in boys there is a diminution in the rate of growth, and at puberty (13th year in girls and 16th in boys) the activity of growth is the greatest. Between 12 and 15, girls grow heavier and taller than boys, but at 15 the boys again lead and maintain it through life. Growth usually continues to about the age of 25 in males and there may be a slight increase for 5 or 10 years afterwards. Girls usually attain adult stature at about 21 years. Weight usually increases in the male and frequently in the female to the 50th or 60th year, due to an accumulation of fat.

The Period of Childhood may be said to extend from the end of the second year to puberty or youth. By the end of infancy, the anterior fontanelle is closed, the temporary teeth are cut and the child is beginning to talk and walk, to use judgment and memory and to display independence. Childhood is characterized by active growth and development of the body and mind. Arrest of growth and loss of weight indicate malnutrition. On the other hand, while a very thin baby is abnormal, a very fat child or youth is, as a rule, one whose nutrition is at fault, or whose diet is too rich or generous.

The preparation of boys and girls for the duties and responsibilities of manhood and womanhood, requires especially that their brains, muscles, and digestive apparatus shall be strong. Nerve force must be stored not dissipated, and coddling is wrong. Their nervous systems are normally very active and sensitive to impressions, hence nervous disorders and exhaustion are readily induced by over-stimulation of the brain, through excitement, too much study, etc. Physical and mental training must go together. A vigorous child is almost constantly in motion, either at work or play, and this is as it should be. The same amount of exercise would exhaust an adult. It is well understood that systematic muscular exercise besides hardening the muscles improves the mental strength, that well developed children take a higher rank in school than those of the same age less developed. Abundant out of door exercise also develops the co-ordinating power of muscles and the special senses, induces a greater respiratory range, better oxidation, and an increased power of the heart. Thus nutrition is stimulated and a symmetrical development obtained. And this is just as necessary for girls as for boys. Children need sleep oftener and longer than adults. A healthy young baby sleeps nearly two thirds of the time and a healthy child of seven will often sleep quietly for twelve hours or more. Disturbed sleep and sleeping with the mouth open indicate some nervous gastric or intestinal disturbance or the presence of enlarged tonsils.

After the first few years of life the special senses seem to acquire an acuteness, more marked than in later life when the perceptions are associated with more complex mental processes. Children require much food and the diet should be nutritious, but overloading the stomach, especially with sweets and fruit, may excite general convulsions, vomiting, diarrhœa and alarming fever. A vigorous, healthy boy often eats, and may require about as much food as the average man. A variable appetite or the habit of eating mainly one class of foods is indicative of innutrition. A properly mixed diet is necessary for health. Sugar (candy, etc.), valuable in reasonable amount, should not be eaten in such quantity as to interfere with the appetite for regular meals. Children, especially those who eat but little sugar, should be taught to eat fat. In childhood the lymphatic system is still active, the glands readily enlarge as the result of irritation or of general disease, especially scrofula. The respiration in early childhood as in infancy is mainly diaphragmatic — the abdomen moves freely. The temperature normally is about 100° F. A sudden high temperature is much less significant than in the adult, so also is an increase in the rapidity of the pulse. Young children lose heat readily from the surface of the body, and are susceptible therefore to "taking cold" when insufficiently clad. The line should be carefully drawn between overdressing and the "hardening" process, and woolen garments except in the hottest weather are advisable.

Owing to the large amount of food consumed and the detritus resulting from the activities of the body — a free discharge of waste by the skin, kidneys and bowels should be facilitated by frequent bathing, the drinking of considerable pure water and the use of fruit, graham bread and green vegetables.

The stomach in children is straighter and more vertical than in adults, but less so than in infants. Vomiting is still easily produced. The small intestine is relatively much longer than in adults, due to the fact that much nourishment is to be digested.

Children are susceptible to nervous disorders such as chorea and certain forms of paralysis, and to whooping cough, mumps, measles, etc., which last are often classed as "children's diseases." Spinal deformities are readily induced. Certain diseases, such as tuberculosis, are likely to affect a large number of organs at the same time. The recuperative power of a normally healthy child is very great, even in severe diseases.

The mortality of young children in general is enormous but decreases with age. It is greatest among those whose hygienic conditions are bad, who suffer from poor or insufficient food, impure air, etc. Diphtheria, scarlatina, measles, croup, pneumonia and intestinal disorders are the chief causes of death.

The Period of Youth, Adolescence or Puberty, is that period of life between childhood and maturity; in law, "that period from 14 in males and 12 in females till 21 years of age." It occurs earlier in hot climates than in cold, is hastened by luxurious living and habits of idleness and is retarded by severe labor, hardship, privation and ill health. It is that period when the individual becomes fitted for reproduction by the development of the sexual organs. The voice is unsettled, due to a rapid general enlargement of the laryngeal cartilages and a lengthening of the vocal cords. Hair appears in the pubic region, in the axillæ and on the face in the male. In the female particularly, fat is rapidly deposited in the subcutaneous cellular tissue of the breast and extremities, adding to the comeliness of the form. The function of menstruation is established, preceded in a varying degree by headache, backache, physical and mental lassitude, palpitation, bleeding from the nose, nervous irritability and hysteria. Sexual maturity is evidenced by awakened sensibilities towards individuals of the opposite sex, of attraction, of repulsion or of timidity and shyness. In youth there is a pronounced development of the limbs, an increase in the size of the chest and a diminution in the size of the head and abdomen. The spine now forms a double curve, and the pelvis widens especially in the female. Mental faculties mature. A girl becomes a woman earlier than the boy a man.

Inasmuch as the rapid nutritive changes are prone to be attended by more or less grave disturbances of the nervous functions, it is essential, in order to have a sound mind in a sound body (that is, health), to carefully regulate physical and still more, mental exertion. The habit of self control must be encouraged, and exaggerated language discouraged. School duties should not be imposed beyond, or even up to the limit of tolerance of the individual, and social functions should not interfere with an abundance of sleep and outdoor exercise, else the result will be a wreck of the nervous system, and prolonged nervous and muscular prostration. Recklessness as to the laws of health are responsible for much of the sickness at this period of life. Purity of thought and action are great safeguards against the temptations which beset growing youth, which if yielded to they impair or destroy both mind and body. Animal impulses are to be subordinated to aspirations of the mind. The continued fevers such as typhoid, severe inflammations, as pneumonia and acute rheumatism, tuberculosis and heart affections, are the principal diseases of youth. Scarlet fever, measles and other eruptive diseases may affect the individual, but not commonly. Alcoholism is a dangerous condition, easily acquired. Neurotic conditions, especially in the female, too frequently occur.

The Period of Maturity begins at about the end of the 21st year, and extends in men to about the 60th, when the power of reproduction wanes, and in women to about 40 or 45, when the menopause occurs; the breasts and reproductive organs diminish and ovulation ceases. In women, at this time (as in the onset of puberty), the organic functions may be irregular; dyspepsia, palpitation, sweating, vertigo, neuralgia, irritability and melancholy may occur. The "change of life" is in reality therefore attended with a severe nervous shock. Manhood and womanhood begin when the individual has reached the full stature, when the skeleton is firmly ossified, the jaw is square, the chest fully expanded, and the limbs well developed. Gradually from this time onward in most instances fat begins to accumulate, especially upon the abdomen, towards the end of maturity.

Popularly it is believed that man is in the "prime of life" from 35 to 50, but there are many instances of farmers, professional and business men and women being successful and at active work and in good health at 60 or more. The fact is, that the ability to do hard work, mental or physical, at an advanced age, depends upon habits of industry and method, and upon the care of the health which have been inculcated in earlier life, and are continued into and through adult life.

Gradually as adult life advances, the inclination and sometimes the power for active exercise fails. These are evils to be guarded against. Out-door games, horse-back riding, and vigorous walking, for example, may be pursued advantageously as a rule to 45 or 50 years of age. At about this time degenerative changes occur in the body and care is necessary that the heart and blood vessels be not overstrained. During the prime of life the body enjoys a maximum of vigor and power of endurance, and there is reason to believe that this is also true of the mind. But the self-consciousness of power that the individual possesses is frequently a menace, for it induces him to struggle for wealth or fame in the turmoil and bustle of modern life, to neglect recreation, to resort to alcoholics and other stimulants to keep up his energy, and to indulge in general high living. It is especially true at this time of life that no one should work up to the full measure of his ability. Such work is dangerous and has been responsible for the "breaking down" of the health and the death of many otherwise intelligent persons. The principal diseases of adult life are alcoholism, gout, cancer, urinary and venereal diseases, rheumatism, pneumonia, tuberculosis, affections of the brain and nervous system, of the heart and blood vessels and of the digestive system.

The Period of Old Age or Senility usually commences about the 60th year and is characterized by a waning of the vital powers and by atrophic and degenerative changes, the natural consequences of decay. While death frequently results from local accidents of the brain and nervous system (apoplexy, sclerosis, etc.) and of the heart, blood vessels and urinary organs irredeemably damaged in the course of decay, it is normally but the ending of a natural life, and not a pathological fact as in earlier life. The stature of the old is less, the shoulders rounded, bones are more fragile, the cartilages are hardened, the lower jaw resembles that of the infant, the chin is prominent, the skin is wrinkled owing to the absorption of fat, and loses its elasticity, the teeth decay and fall out,

urination is frequently difficult, the respirations and heart beats are reduced in frequency, the arteries have a tendency to ossify, the veins to dilate. The muscles fail in their tension, the voice becomes a "childish treble," the digestion is weakened, the eye no longer sees clearly, and hearing is dulled. The mind may preserve its freshness for a long time. Usually the senses fail first, next the faculties of memory, reason and volition. Towards the close of life the organic or vegetative phenomena prevail. The natural death occurs when the breath becomes fainter and fainter and the heart beats are weaker and fitful — and then gradually cease.

Old people require an abundance of sleep. They need also to be kept warm, for heat is generated in them in smaller amount than in robust health. Hence they are easily chilled. Food should be plain, largely liquid, and that which is easiest digested. Exercise in the open air every day is desirable but it should be gentle in character. With these precautions old age may be made comfortable. JEROME WALKER, M.D.,

Author of 'Walker's Physiology.'

Grub, the larva of an insect, especially of a beetle or fly. In reference to cattle it usually means the maggot of a flesh-fly or warble. See BOT-FLY; LARVA.

Grubb, SIR **Howard**, Irish optician and telescope-maker: b. Dublin 28 July 1844. The largest telescope of his construction is the 27-inch of the Vienna Observatory. He was the first to suggest a movable floor for an observatory dome, which has been adopted in the dome of the great 36-inch telescope of the Lick Observatory. He has been vice-president of the Royal Dublin Society from 1893, and was knighted in 1887.

Grübel, grü'bel, **Johann Konrad**, German poet: b. Nuremberg 3 June 1736; d. Nuremberg 8 March 1809. He was a saddler and harness-maker, and passed his youth in privation; but he possessed genuine poetic gifts, as shown in the pictures he has given of the lives and manners of his countrymen in the three volumes of 'Poems in the Nuremberg Dialect' (1802). Another volume appeared in 1808.

Gruber, grö'ber, **Johann Gottfried**, German author: b. Naumburg, on the Saale, 29 Nov. 1774; d. 7 Aug. 1851. He studied at Leipsic, and in 1811 was appointed professor at the University of Wittenberg, and in 1815 professor of philosophy at Halle. His chief work was that of editing, first with Ersch, and after his death, alone the first section of the 'Universal Encyclopædia.' His independent works include: 'Herder's Characteristic' (1805); 'History of the Human Race' (1805); and Lives of Wieland (1815–16), and Klopstock (1832); he also edited 'Wieland's Complete Works' (1818–28).

Grün'berg, Germany, capital of the circle of Grünberg in the Prussian province of Silesia; on the Oder, 15 miles east of Giessen. It is surrounded by vineyards, and large quantities of wine are made here and in the vicinity. Pop. 21,268.

Grundtvig, groont'vĭg, **Nikolai Frederic Severin**, Danish theologian, historian and poet: b. Udby, island of Seeland, 8 Sept. 1783; d. Copenhagen 2 Sept. 1872. He was educated at the University of Copenhagen, and in 1822 went to Copenhagen as chaplain. He made a fierce attack on the rationalism of the time in his 'The Answer of the Church' (1825), a reply to Professor Clausen, and for the violent expression of opinion in this work was severely censured and resigned his position. For a time he devoted himself to literary work, and through his writings exercised a great influence on the religious and political thought of Denmark. In 1839 he became pastor at the hospital church of Vartov, Copenhagen, and held that position till his death, being made a bishop in 1861. He was for a time a member of the Danish diet, and took an active part against Germany and German influence. His most important work is 'Northern Mythology'; he also wrote a number of poems, among them some very popular national songs, and translated 'Beowulf.'

Grundy, Felix, American jurist: b. Berkeley County, Va., 11 Sept. 1777; d. Nashville, Tenn., 19 Dec. 1840. Studying law, he was admitted to practice in 1798, and soon acquired a high reputation as an advocate in criminal cases. He was a member of the Tennessee legislature 1799–1806, and in the latter year was appointed one of the judges of the supreme court of errors and appeals. In 1811 he was elected representative to Congress, and re-elected in 1813. In 1829, and again in 1833, he was elected to the senate of the United States, where he was among the most prominent of the supporters of President Jackson. In 1838 President Van Buren appointed him attorney-general of the United States; but in 1840 he resigned that office, and was re-elected to the senate.

Grundy, Sydney, English dramatist: b. Manchester 23 March 1848. He was called to the bar in 1869 and practised till 1876, but has since become known at home, and in the United States, as a successful and popular playwright. Among his very numerous plays are: 'The Glass of Fashion' (1883); 'A Fool's Paradise' (1890); 'A White Lie' (1893); 'Sowing the Wind' (1893); and 'The New Woman' (1894); 'Slaves of the Ring' (1894); 'The Degenerates' (1899); 'Frocks and Frills' (1902).

Grundy, Mrs., a personage constantly appealed to in the phrase, 'But what will Mrs. Grundy say?' in Morton's play, 'Speed the Plough' (1800), but who never appears among the *dramatis personæ*. The phrase has now come to stand for the judgment of society in general upon actions or conduct.

Grunt, or **Croaker**, a drumfish (q.v.).

Gruson, groo'sŏn, **Hermann**, German inventor and manufacturer: b. Magdeburg 13 March 1821; d. 1895. He studied at Berlin; became chief engineer of the Wöhlert machine shops in Berlin in 1851, and in 1854 went to Buckau as director of the Hamburg-Mecklenburg steamship company. There he established a shipyard of his own and built a small iron foundry, where he invented a process of chilled cast iron, which was much used in the manufacture of machinery, as well as for armor. His establishment consequently grew rapidly, and in 1886 was incorporated, manufacturing armor for most of the states of Europe. Gruson was manager of the company until July 1891, when he retired and devoted himself mostly to study and experiments in physics. In 1893 the works were sold to Krupp.

Grützner, Eduard, ed'oo-ärd grüts'nĕr, German painter: b. Gross Karlowitz, Schlesien, Germany, 26 May 1846. He began the study of

art without a master, and his talent having been recognized by the architect, Hirschberg, he was taken by the latter to Munich, 1864. He was there admitted to the school of Piloty. Hirschberg engaged him to paint in oil seven pictures for the ceiling of a room in his house, but he first appeared before the public as a humorous painter, Shakespeare's Falstaff being his favorite subject. He is, however, known all over the world for his pictures of monks, in the cellar, tailor's shop, kitchen, etc. Well-known also is his 'Mephistopheles Behind the Scenes in the Dressing Room of a Ballet Dancer.' His drawing is lifelike, his technique masterly, and he possesses a marvelous power of characterization.

Gruyère, grü-yār, or **Gruyères,** Switzerland, a village in the canton of Freiburg, 16 miles south of that city. It is built on a hill crowned by the fine old feudal castle of the counts of Gruyère, and gives its name to the well-known cheese which is made in large quantities in the surrounding pastoral district. Pop. (1900) 1,297.

Gryllidæ, grĭl'ĭ-dē, a family, the crickets, of saltatorial orthopterous insects, distinguished from the grasshoppers and locusts by the fact that the tarsi are three-jointed and the ovipositor, when exserted, is spear-shaped; the wings, when present, fit closely to the body. The family includes three types: (1) the true crickets, such as the common field cricket, or the hearth cricket of Europe, which are of the genus *Gryllus;* (2) the burrowing, curiously modified mole-crickets (q.v.); (3) the tree-crickets, pale-colored nocturnal forms which lay their eggs in the twigs of different plants, and which sometimes are so abundant that by their egg-laying alone they do considerable damage to vineyards and to raspberry and blackberry plantations. The black field-crickets, of which the commonest American species is *Anabrus simplex,* inhabit burrows in the ground and come abroad to feed on grass and herbage at night, and sometimes in daylight. They deposit eggs in the ground in the autumn, but these do not hatch until the following spring. Our black crickets rarely enter houses, but the European hearth-cricket (*G. domesticus*) is naturalized in Canada.

The crickets are the most musical of all this class of insects, and elaborate studies of their song and its variations according to weather have been made by S. H. Scudder. The musical apparatus consists of modifications of the upper edges of the wings, which are more elaborate than those even of the *Locustidæ.* Consult Howard, 'The Insect Book' (1901), which contains a large bibliography.

Gryphon. See GRIFFIN.

Guadalajara, gwä-dä-lä-hä'rä, Mexico, capital of the State of Jalisco. This city, which is one of the finest in the republic, contains a large number of government buildings, schools, and institutions of higher education (including a college of medicine and pharmacy, law school, lyceum, and normal school), a cathedral, several parks, and the largest theatre in the country. The chief industries are the manufacture of cotton goods and leather; there are also two breweries, a paper-mill, and canning factories. Banks are: the Bank of Jalisco, with a capital of 1,500,000 pesos, and branches of the National Bank of Mexico and the London and Mexican Bank. According to the revised census of 1895, the population of the city was 83,934.

Guadalupe (gâ-da-loop') **River,** has its rise in Kerr County, Texas, flows a general east and southeast course into San Antonio Bay. It is about 260 miles long, and is navigable as far as Victoria.

Guadalupe-Hidalgo, gwä-dä-loo'pā-ē-däl'-gō, a village of the federal district of the United States of Mexico, at the foot of the Guadalupe Mountains, three miles north of the city of Mexico. The treaty of peace between the United States and Mexico was signed here 2 Feb. 1848. The village contains the famous picture, 'Our Lady of Guadalupe,' which tradition says was received in a miraculous manner by an Indian, Juan Diego, in 1531. It was long held in high repute by the people in and about Mexico; but it was not until 1757 that Pope Benedict XIV. gave sanction to the devotion.

Guadalupe-Hidalgo, Treaty of, 2 Feb. 1848; the treaty which closed the Mexican War. The place is a suburb of the city of Mexico. While the war was in progress, Polk sent Nicholas P. Trist of Virginia, then chief clerk of the State Department, to negotiate a treaty of peace; the conditions to include the cession of Upper and Lower California and New Mexico (conquered by Kearney, Stockton and Frémont, and a chief object of provoking the war), and the Rio Grande for boundary between Mexico and the United States. Trist went to Scott's headquarters, an armistice was arranged, and in August 1847 the three Mexican commissioners and Trist met and exchanged proposals. The former would not yield to such terms, demanded the Nueces as the boundary (giving them Corpus Christi and a large triangle at the south), and offered much less other territory. Trist was recalled, but remained at headquarters; Santa Anna declared that he was tricked in the proposals, war operations went on, and the city of Mexico was captured not long after. In January 1847 negotiations were resumed, Trist still acting as principal, and the treaty above was agreed on. The Senate, however, refused to accept it, and insisted on harsher terms; Mexico was forced to accept them, and the Senate ratified the treaty 10 March. Formal proclamation was made 4 July 1848. The land cession was of Upper California and New Mexico, and the Rio Grande was made the boundary. The United States paid Mexico $15,000,000, and assumed $3,250,000 of claims made by United States citizens against Mexico prior to the treaty, besides any claims to which under the conventions of 1839 and 1843 Mexico was adjudged liable. Of the 252 claims put in under this treaty, 182 were finally allowed.

Guadeloupe, gâ-da-loop' (Fr. gwäd-loop), West Indies, an island of the inner chain of the Caribbees. (See ANTILLES.) It lies in lat. 15° N. and lon. 61° W. and, with its dependencies, has an area of 583 to 600 square miles. A strait divides it into two parts, called Basse-Terre and Grande-Terre. The former is mountainous, its highest peaks being La Soufrière (4,900 feet), Deux Mamelles (2,540 feet), Grosse Montagne (2,370 feet), and Caraibe (2,300 feet); and its volcanic character has been manifested most impressively by the eruption of La Soufrière in 1797 and the disastrous

earthquake in 1843. The eastern division, or Grande-Terre, on the contrary, is a calcareous plain, which at no point attains an elevation of more than 450 feet. The mean temperature of Guadeloupe is 78° F., the maximum being 101° and the minimum 61°. The dependencies referred to above are the adjacent islands, Maria Galante, Les Saintes, and Désirade. The chief products are sugar, coffee of the finest quality, and cocoa. Revenues amount to about $1,300,000 to $1,400,000 annually; expenditures, including the appropriations made by France from time to time, are somewhat in excess of that sum. Guadeloupe is a department of France, represented in the French chambers by one senator and two deputies. Its local interests are directed by a governor and a general legislative assembly of 30 members, the jurisdiction embracing one half of St. Martin, besides the islands which have been mentioned. There are nearly 100 elementary schools, with 11,000 pupils, and one *lycée,* with 350 pupils. The chief seaport, Point-à-Pitre, with about 17,000 inhabitants, is situated on the eastern side of Basse-Terre. Several times its buildings have been destroyed or severely damaged; in 1903 minor earthquakes were reported to be of frequent occurrence; and a fresh outbreak from La Soufrière was thought to be not improbable. Le Moule, the principal town of Grande-Terre, resembles Point-à-Pitre in size and situation. After the discovery, Guadeloupe belonged to Spain until 1635; in that year it was taken by the French; in 1794 England seized it, freed the slaves, and retained possession until 1802; then it passed again into French hands, together with Martinique, England taking St. Lucia in exchange; the restoration of slavery by the French was resisted by the negroes, and was attended with great suffering and loss of life; for a brief period in 1810 England once more held Guadeloupe, but returned it to France; emancipation was declared in 1848. The inhabitants are largely French mulattoes, with perhaps 15,000 coolies. Total population, including dependencies, about 167,000. Consult Hill, 'Cuba and Porto Rico, with the other Islands of the West Indies.'

Marrion Wilcox,
Authority on Spanish America.

Guadiana, gwä-thē-ä'nä, a river of Spain and Portugal, which rises in the plateau of New Castile, flows first northwest, then circuitously southwest into and across Estremadura, and on reaching Badajoz turns southwest and forms part of the boundary between Spain and Portugal. Entering Portugal it flows past Monsaraz, Moura, and Serpa, to Mertola, again forms the boundary between the two kingdoms, and falls into the Atlantic between Castro Marim on the Portuguese, and Ayamonte on the Spanish side. Its course is about 515 miles, of which only 35 are navigable. Its chief tributaries are the Gigüela, Bullaque, Valdehornos, and Rubial on the right, and the Azuel and Jabalon on the left.

Guagua, gwä'gwä, Philippines, a pueblo of the province of Pampanga, island of Luzon, on one of the main channels of the Pampanga delta, 3 miles southwest of Bacolor. It is the port for Bacolor, has steamboat communication with Manila, and has an extensive business in groceries and drugs. Pop. 10,700.

Guaiacum, gwī-a-kŭm, a genus of trees of the natural order *Zygophyllaceæ,* natives of tropical America, remarkable for the hardness and heaviness of their wood, known as *lignum vitæ,* or Brazil-wood; also the peculiar resinous product of the common species (*G. officinale*). This is a tree 30 or 40 feet high, usually growing with crooked stem and knotty branches. The wood and resin have been obtained chiefly from Cuba, Jamaica, and San Domingo, but the tree is becoming scarce there. Guaiacum-wood is remarkable for the direction of its fibres, each layer of which crosses the preceding diagonally. It sinks in water. It is much valued and used for pulleys, casters, mortars, bowling balls, and other purposes requiring an extremely firm and durable wood. It is pale yellow on the outside but blackish brown near the heart, where it abounds in resin. Stimulative and other medicinal properties reside in the bark, leaves and resin of this tree.

Guaira, La, lä gwä-ē'rä, Venezuela, a seaport on the Caribbean Sea, five miles in a direct line (29 miles by rail) north of Caracas, of which it is the port. It is situated on a narrow coast strip between high mountains and the sea, and has an unhealthful climate. There are modern harbor works including a breakwater, and a considerable export and import trade is carried on. In 1901 the exports of coffee amounted to 7,290 tons; of cocoa, 3,776 tons; and of hides, 782 tons; the imports include manufactured goods, provisions, wines, etc. The town dates from an ancient Spanish settlement in 1588. In 1903 the port was blockaded by British and German fleets to enforce a settlement of commercial claims. Pop. 14,000.

Gual, gwäl, **Pedro,** South American patriot: b. Caracas 31 Jan. 1784; d. Guayaquil, Ecuador, 6 May 1862. He was graduated from the University of Caracas; joined the patriots in 1810, and was elected as a member of the legislature in 1811. In 1812, when the republicans surrendered, he escaped to New York, but in a few years returned, was made governor of Cartagena, and later sent as ambassador to the United States. He was admitted to the bar in Washington, and began the practice of law, but in 1816 joined Bolivar, was made governor of some of the conquered provinces, and was for a time minister of finance and foreign affairs. In 1858 he joined the revolt against Monagas, and was made president of the provisional government; in 1859 he was elected vice-president of Venezuela, and in 1860 became president, but resigned the next year, retiring to private life.

Gualeguay, gwä-lā-gwī', Argentine, South America, city in the province of Entre Rios; on the Gualeguaychu River. It is a trade centre for a region in which cattle raising is the chief industry. Pop. 7,810.

Gualeguaychu, gwä-lā-gwī-choo', Argentine, South America, city in the province of Entre Rios, on the Gualeguaychu River, 11 miles from its mouth. Its chief industries are connected with the raising and shipping of cattle and wheat. Pop. 14,000.

Guam, gwäm or goo-äm', or **Guajan,** gwä-hän', one of the Ladrone Islands, the southernmost and largest, and the only one with much population; east of the Philippines; occupied by the United States in 1898, the remainder of the group belonging to Germany. It is 29 miles long by 3 to 10 wide, and about 150 square miles in area; high and precipitous

on the eastern side, and forming a low plateau in the northern part, but mountainous in the south. About half the soil is arable, but only about one per cent cultivated. Except for the native clearings, most of it is thick and pathless jungle. Some of the trees are valuable hardwoods for ship-building or ornamental cabinet-work; others are useful for food, as the cocoanut (the finest here of all the tropics), pineapple, breadfruit, sour-sop and custard-apple, etc.; the hau (*Hibiscus tiliaceum*) makes strong cordage, not affected by water; the pandanus' long leaves are braided into mats and hats; and the ylang-ylang is famous for perfume. Rice, sugar, tobacco, hemp, coffee, cacao, bananas, melons, etc., have been introduced and are cultivated. The only native mammals are rats, flying foxes, and bats; but the deer and wild goat, of European origin, have thriven plentifully, and cows and pigs are raised. There are no snakes; there are centipedes and scorpions, but none dangerous. The climate is very rainy, but mild except in midsummer, when the conflict of trade-winds produces a dead calm, oppressive heat, and storms, with some hurricanes. Earthquakes are frequent. The island is volcanic, with bordering coral reefs. The east side has but two good harbors, Pago and Tarofofo; the latter is the only one, except San Luis d'Apra on the west, which is safe for vessels all the year round. The island contains about 9,000 people; Chamorros with a mixture of Tagal and Malay, and some Anglo-Saxons from whaling ships, producing half-breeds with copper skins and light hair. They are nearly all in the villages; those with ranches build rough huts on them, where the family spend part of the time. Agaña (San Ignacio d' Agaña) is the only large town; it is a neat place with houses half of stone and half of wood or bamboo, and contains 6,400 people. Its best port is Apra (above), on a deep bay formed by a peninsula; its own harbor being dangerous in a storm from the anchors dragging on the coral bottom, and the landing bad from breaking reefs. There is a mission school, endowed in the 17th century by Maria Ana, queen of Philip IV. of Spain. Umata, on the west, was the former capital. Agat, 400 people, is next in importance to Agaña; but the next largest in size are Suwai, 900, and Ynarajan, a fair port on the southeast, 550. Merigo has 300. (Wheeler, Report on Guam, 1900, War Dept. doc. 123.)

Guan, gwän, a gallinaceous bird of the family *Cracidæ,* genus *Penelope,* characterized by the front of the throat being naked and wattled; specifically *P. cristata.* It is about 30 inches long, nearly half of which is due to the tail. The color is a shining reddish-green, with rump and belly chestnut, neck and crest white-spotted, and the feet and throat red; the female is of a more reddish tint, with the crest, neck and mantle bordered with white. Though the guans have most of the habits of the curassow (q.v.), they are far less gregarious, noisy and restless. They take to trees when alarmed, roost there at night and often make their nests among the branches. They inhabit the American tropics, one species, the chacalaca (*Ortalis vetula*), ranging into Texas. Guans have long been domesticated in South America.

Guanabacoa, gwä-nä-bä-kō'ä, Cuba, a town well situated on high ground near the city of Havana. The number of its inhabitants shown by the United States War Department census of 1899 was 13,963 (that is, 8,232 native white: 1,091 foreign white; 2,173 negro; 2,408 mixed; and 61 Chinese). The total population of the district of Guanabacoa was 20,080.

Guanaco, gwä-nä'kō. See HUANACO.

Guanahani, gwä-nä-ä-nē'. See CAT ISLAND.

Guanajay, gwä-nä-hī', Cuba, town in the department of the same name in the province of Pinar del Rio, about 30 miles west of Havana. It is situated in a hill region of much salubrity, and is a popular health resort. Here is the terminus of the Havana and Guanajay Railroad. Pop. about 9,000.

Guanajuato, gwä-nä-hoo-ä'tō, Mexico, a state bounded by the states of San Luis Potosi, Queretaro, Michoacán, and Jalisco. Area 20,276 square kilometres, or 7,806.26 square miles. The principal cordilleras traversing the state are the Sierra Gorda, in the northeast, and the Sierra de Guanajuato in the centre, which are formed by the junction of the Codorniches, San Antonio, and Santa Rosa mountain ranges. The highest peaks are the Gigante (2,346 metres) and the Llanitos (2,815 metres). In the south and west are the valleys of San Judas, San Felipe, and Santiago, and the fertile plain of El Bajo. Rivers are: the Lerma, with its affluents the Laja and the Turbio, the Irapuato, and a number of smaller streams. There are many mineral springs, and one lake, 37 1-3 square miles in extent, called the lake of blood (Yuririapundaro). Five mining districts merit special mention; namely, the Sierra Gorda, Allende, Santa Cruz, Guanajuato, and Leon, the principal mines being those which produce silver and gold, silver, mercury or cinnabar, tin, iron, lead or argentiferous lead, and copper or argentiferous copper. On 31 Dec. 1897 there were 550 claims registered, of which number 80 were in process of development. (See statistics given in connection with the department and city of Guanajuato.) The climate, except in the higher parts of the mountain ranges, is not unfavorable (mean annual temperature about 70°). The rainy season extends from the middle of May until the beginning of July. During those months the rainfall is heavy in the valleys, but only moderate in the mountains. The value of agricultural products in 1897 was given as follows: Corn, $7,000,000; barley, $190,000; wheat, $5,000,000; chile, $490,000; tobacco, $32,000; wool, $80,000. The total value of live stock was estimated at $10,000,000. The state is regarded as the most important mercantile centre of the republic. Its total trade, estimated at $67,000,000 per annum, is distributed as follows: Exports of minerals to Mexico city, the United States, and Europe, $20,000,000; exports of agricultural and other products to Mexican States, $10,000,000; exports of manufactured products, $2,000,000; imports from Mexico city, the United States, and Europe, $12,000,000; imports from other Mexican states, $3,000,000; the balance consisting of local trade. The chief imports are groceries, ready-made clothing, textiles, hardware, drugs, arms and ammunition, hats, canned goods, agricultural and mining machinery, and tools. There are 350 woolen mills, 853 cotton mills and 72 flour mills; also saddleries, potteries, powder-works, distilleries, tanneries, and foundries. Railway lines traversing

the state are the Mexican Central, Mexican National, and Salamanca and Valle de Santiago. Principal towns have street-railways. The telegraph, telephone, and postal services of the state are moderately efficient. The state is divided into five departments, sub-divided into 31 partidos. Departments, with their chief towns, are: Allende, population, 161,904, principal towns San Miguel Allende and Dolores Hidalgo; Celaya, population, 277,321, principal town of the same name; Guanajuato, pop. 387,718, its principal town, of the same name, being the capital of the state (see GUANAJUATO CITY); Leon, population 142,157, principal towns Leon de los Aldamas and San Francisco del Rincón; and Sierra Gorda, population 93,456, principal towns San Luis de la Paz and San José de Iturbide. Consult 'Mexico: a Geographical Sketch' (Washington, 1900).

Guanajuato City, Mexico, capital of the state of Guanajuato. It is situated in a narrow valley on the Guanajuato River, 252 miles by rail from Mexico city. Principal buildings are the state government palace, the Palace of Congress, mint, state college, churches, two theatres, hospitals, a bull-ring, Market de la Reforma, Pantheon, and the Castle of Granaditas, where the heads of the patriots Hidalgo, Allende, Aldama, and Jimenez were hung on iron hooks during the war for independence. This city is the commercial centre of the state, and one of the most important in the republic. It is connected with the Central Railway by a branch line, and has street-railways, electric lighting, and other modern improvements. The mineral wealth of the district is indicated by the following figures: From 1812 to 1896 the combined value of gold, silver, and copper coined by the Guanajuato mint was $309,077,468.25, Mexican silver, the gold coinage being estimated at $21,178,328; silver, $287,884,476.25; and copper, $14,664. Pop. 53,000.

Guanare, gwä-nä'rā, Venezuela, city, capital of the state of Zamor, near the Guanarito River, about 220 miles southwest of Caracas. Coffee and sugar-cane are some of the chief agricultural productions; but the city is the centre of an extensive cattle trade. Pop. about 11,500.

Guanes, gwä-nās', or **Guane,** Cuba, town in the province of Pinar del Rio; about 10 miles from the sea, and 120 miles southwest of Havana. The district court holds its sessions here. The trade in the products of the surrounding country, cotton, tobacco, and cattle, is extensive. There is also a large trade in lumber. Pop. (1899) 14,760.

Guan'idin, a basic organic substance, having the empiric formula CH_5N_3, and the constitutional formula $HN{:}C(NH_2)_2$. It may be prepared by heating an alcoholic solution of cyanamide and ammonium chlorid to 212° F. Guanidin is a crystalline, deliquescent substance, with strongly alkaline properties, and it absorbs carbon dioxid from the air. It forms numerous salts, and urea is evolved in many of its reactions. In fact, it is this close relation with urea that gives guanidin its chief interest, many authorities holding the opinion that guanidin is an intermediate product in the formation of urea from proteid bodies, in the normal physiological chemistry of the body.

Guanin, gwä'nĭn, a yellowish-white, amorphous substance, which derives its name from being a constituent of guano; but it also forms the chief constituent of the excrement of spiders, has been found attached to the scales of fishes, and seems to be a normal constituent of the mammalian liver and pancreas. With regard to its occurrence in guano, as it has not been found in the recent excrement of sea-birds, there is every reason to believe that it is formed by slow oxidation (from atmospheric action) of uric acid, much as uric acid can be made to yield urea and oxalic acid. And in the pancreas and liver it probably represents one of those transitory stages of disintegrated nitrogenous tissue which are finally excreted by the kidneys in the more highly oxidized form of urea. Guanin is a diacid base, but also forms salts with metals, and combines with salts. When heated with hydrochloric acid and potassium chlorate, it is oxidized to carbon dioxide, guanidin, and parabanic acid.

Guano, gwä'nō, Spanish, *guano huano*, from Peruvian *huanu*, dung, is the name for deposits of the partially decomposed and dry excrementitious matter of sea-birds. but it has been also extended to accumulations of a similar kind from land-birds, and even from bats in caverns. Deposits from sea-birds are got wherever there is good feeding-ground in the neighborhood of unfrequented islands and rocky cliffs, and such may be seen around many shores. But to render them of practical utility atmospheric conditions are requisite which are only found in certain localities, and all the great guano deposits exist in the hottest and driest parts of the tropics, as on the islands of the South Pacific Ocean. The most important of all were the deposits on the Chincha Islands off the coast of Peru, which for years yielded a considerable revenue, but are now quite exhausted. The guano which was found there was from 60 to 80 or 100 feet in thickness, and was entirely due to the droppings, accumulated for many ages, of the innumerable sea-birds which make these islands their resting-place and breeding-ground. The excrement which is at first pasty, rapidly dries by exposure to the sun in a part of the world where a fall of rain takes place once in a lifetime, and is looked upon as an historical event, and thus, while putrefaction is almost entirely arrested, the soluble salts of which guano to a great extent consists are retained. This guano, called technically Peruvian, is the most highly prized, and is regarded as a type of the substance; but quantities are or have been got from other localities, as Patagonia, various points of Bolivia, Mexico, and Chile, Malden Island and numerous other Pacific islands, new deposits being opened up as the older become less productive.

Guano varies extremely in composition, even in the same deposit considerable differences will be found; and when deposits from different localities are compared, there is sometimes no analogy except in the kind of substances present. Thus, some consist mainly of phosphate of calcium and other fixed salts, while others contain much volatile matter, with a large proportion of ammonia. To the latter belongs Peruvian guano, which is a very light, dry, non-cohesive pale-yellow powder, with a characteristic ammoniacal odor, and sometimes containing lumps, made up of different salts. It is a very complex mixture, containing the urate of ammonium, the oxalates

of ammonium and calcium, the phosphates of sodium, ammonium, calcium, and magnesium, the sulphates of potassium, sodium and ammonium, the chlorides of sodium and ammonium, and the carbonate of calcium. There is always some moisture, organic matter of different kinds, sand from the rock on which the deposit lies, and this is sometimes considerable. These may be regarded as the possible constituents of guano, but the ingredients which are especially prized are the ammoniacal salts, the phosphoric acid, in combination with the alkalies and alkaline earths, and the alkalies themselves, particularly the potash. It is the remarkable abundance of these constituents and their fine intermixture which makes genuine Peruvian guano so much esteemed as a manure. It contains almost all the inorganic matter required by a plant, and that in a highly available form, so that it is one of the best of all fertilizing agents for different crops. Its use as a manure was known to the native Peruvians centuries ago, but no attention was paid to the accounts by modern travelers of its wonderful efficacy until A. von Humboldt took some to Europe, in 1804, and had it analyzed. It was not exported on a large scale till about 1850, and from that time the quantity sent to foreign countries, including large shipments to the United States, was very great, but the supply has latterly much fallen off.

As a substitute for ordinary guano, what is known as fish-guano has been in use for a considerable number of years. This consists essentially of fish and fish offal dried and powdered. In the case of oily fish, such as herrings, it is necessary to extract as much of the oil as possible before the operation of powdering; and it will thus be understood that different kinds of fish differ greatly as regards their value for manurial purposes. But all sorts of fish-guano contain a large percentage of ammonia and phosphate of lime, and are thus valuable as fertilizers.

Guanta, gwän-tä', **Venezuela**, a modern seaport on the north coast, in the state of Bermudez, 12 miles west of Barcelona, by rail.

Guantanamo, gwän-tä'nä-mō, Cuba, a town in the province of Santiago, situated at the head of the most important harbor east of the city of Santiago on the southern coast. Its surroundings were favorably known before 1898, for the beauty of the groves of lime-trees and lemon-trees, the coffee plantations, and the residences of wealthy planters, who made the heights overlooking the bay a favorite place of resort. Since the Spanish-American war, Guantanamo has been famous as the scene of certain military operations. On 19 May 1898 an unsuccessful attempt to cut the cable in the bay was made by the St. Louis and the Wompatuck. On 10 June a force of 600 marines landed from the transport Panther on the eastern shore of Guantanamo Bay, and undertook to make the outer harbor a secure place for the use of American vessels when coaling, or as a rendezvous and a refuge in stormy weather. The marines established their camp ("Camp McCalla") on a small hill, where they sustained the attacks of the Spanish troops for several days; and the courage and endurance displayed at this time must be regarded as memorable features of the war. The Marblehead and Texas lent assistance, the latter on 12 June sending 40 marines with two automatic guns. In the course of that week the camp was protected by earthworks; other warships arrived and shelled the thickets in which the Spaniards were concealed, the forts, and the town; the garrison was strengthened by accessions of bluejackets and Cuban insurgents familiar with the country; and thus, when ten days had passed, the outer harbor was practically in the possession of the American forces. In July 1901 the United States government selected Guantanamo for one of the four naval stations on the Spanish coast. The number of inhabitants of the town of Guantanamo, according to the United States War Department census of 1899, was 7,137. The total population of the district was 28,063, comprising native white, 7,028; foreign white, 1,843; negro, 8,988; mixed, 10,025; and Chinese, 179.

Marrion Wilcox,
Authority on Spanish America.

Guaporé, gwä-pō-rā', or **Itenez**, ē-tā-nāz', a South American river which rises in the Serra Aguapehi, in the state of Matto Grosso, Brazil, flows south, nearly parallel to the Jauru, passes the town of Matto Grosso, whence it is navigable downward for light draught vessels, then with a northwesterly trend forms part of the boundary between Brazil and Bolivia, and finally after a course of over 960 miles, unites with the Mamoré to form the Madeira.

Guarana, gwä-rä'nä, a dried paste consisting chiefly of the crushed or pounded seeds of *Paullinia sorbilis*, a climbing shrub, native of South America. The seeds are obtained largely from the cultivated plants, and in South America guarana is used much as tea or coffee is used in other countries. It is the staple drink of millions of people. Guarana is found in the drug market in the form of flattened cakes or cylinders of a dark reddish-brown color and showing on fracture numerous coarse angular fragments of seeds. The taste is astringent and somewhat bitter, becoming sweet on chewing. Guarana contains four to five per cent of caffeine, making it twice as strong as coffee. Its action, however, resembles more closely that of tea because of the high percentage of tannic acid it contains. In medicine it has been used in the treatment of sick-headache.

Guarana-bread, the seeds of the *Paullinia sorbilis* (a South American tree), pounded, made into cakes, and dried in the sun. It is extensively used in Brazil and other parts of South America as a stimulant and restorative, and as a material for making a refreshing beverage. The active principle of guaranine, is said to be identical with theine or caffeine (q.v.); and no known substance yields it so abundantly. Other species of *Paullinia* possess poisonous properties.

Guarantee, gär-an-tē', or **Guaranty**, in law, an undertaking to answer for the failure of another. The statute of frauds provides that no person shall be liable on any special promise to answer for the debt, default, or miscarriage of another person, unless a written agreement, or some memorandum in writing for such purpose, shall be signed by the promisor or some other party lawfully authorized by him. In the construction of a guarantee it is a general rule that the surety shall not be bound beyond the express words of the engagement. By the mercantile Law Amendment Act (England and Ireland), no special promise made to answer for the debt, default, or miscarriage of another is deemed

invalid to support an action, by reason that the consideration for such promise does not appear in writing, or by necessary inference from a written document. By a similar statute applying to Scotland, and passed in the same year, all such guarantees must be in writing, and if for a firm will cease upon a change of the members, unless intended by the parties by express stipulation or implication to be binding notwithstanding the change in the firm. Every person who becomes surety for the debt or obligation of another, and discharges his liability, is entitled to the assignment of all securities held by creditors. In the United States the common law on the subject of guarantee or suretyship was the same as that of England and a guarantee was equally forcible whether written or oral, but see SURETYSHIP.

Guard, National. See MILITIA.

Guardafui, Cape. See CAPE GUARDAFUI.

Guardi, Francesco, frän-chĕs'kō gwär'dē, Italian painter: b. Venice 1712; d. there 1793. He was a pupil and follower of Canaletto; his work shows less exactness in detail than his master's, but is superior in use of color. His paintings are mostly of scenes in Venice; they include 'Procession of the Doge'; 'Fete of Corpus Domini'; 'Grand Hall of the Palazzo Ducale' (in the Louvre, Paris); 'Church and Piazza of San Marco' (National Gallery, London); and 'The Rialto' (Metropolitan Museum, New York).

Guardian Angel, an angel who watches over a particular individual. It is the general belief, in the Roman Catholic and Greek Churches that every man has a guardian angel who defends him from evil, suggests good thoughts and wise counsels, and helps him in prayer. This belief is based on the words of Christ in Matt. xviii. 10: "Their angels do always behold the face of my Father which is in heaven"; the Fathers of the Church strongly inculcate it, and in the lives of the saints instances are given of the active interference of guardian angels. The belief is shared by some Anglican high churchmen. The Roman Catholic Church celebrates the Feast of Guardian Angels on 2 October. See also ANGEL; GUARDIAN SPIRIT.

Guardian Spirit, a spirit that watches over the welfare of an individual or household. The belief in guardian spirits finds expression in some form in all primitive religions, and in many which have reached a higher stage of development. The Australian native believes that when a warrior kills his first foe the spirit of the slain enters the body of the slayer, and becomes his guardian; in Tasmania a native has been heard to ascribe his deliverance from danger to the care of his deceased father's spirit; and the most important religious rite of a North American Indian is to obtain a patron genius. In Asia, in Africa, and among the Indians of South America, the belief in guardian spirits obtains, as it did formerly among the Aryans of Northern Europe. Greeks and Romans believed that each individual was under the protection of a spirit who prompted him to good deeds, and guided him throughout his life; gradually there arose a belief in an evil spirit who was at war with the good spirit, and instigated every evil deed. These spirits were called in Greece, Dæmons, in Rome, Genii. The Romans also believed that the spirit of the founder of each family was the guardian spirit (the Lar) of the family and worshipped the Lares with special rites. For the Christian form of the belief see GUARDIAN ANGEL.

Guards. A guard, in the primary sense, is one who watches or protects a person or persons, a place, property, etc., against loss, danger, or harm; as a body-guard, a prison-guard, etc. Body-guards have been an inseparable accompaniment of monarchy from the earliest ages; the Assyrian and Persian kings employed them, and the corps of "Argyraspides," or silver-shields were selected by Alexander out of the bravest men of his army. The Roman emperors had their Prætorian guard. Napoleon I. first created a small troop of bodyguards, with the title of Guides, while he was yet only general, in his first Italian campaign. From this arose by degrees, the great institution of the Imperial Guard, consolidated in 1804, which 10 years later comprised 102,708 men, and after being disbanded by Louis XVIII. in 1815, was restored by Napoleon III. in 1854. It consists of infantry, cavalry, and artillery. In England, the Guards, otherwise called household troops, consist of two regiments of Life Guards, the royal regiment of Horse Guards, and three regiments of Foot Guards. Many of the European sovereigns before the French Revolution had small corps of foreign troops which served in this capacity. Thus the French had, in former times, the Guard of Scottish Archers, and at a later period, a body of Swiss guards, called the Cent Suisses. The Cent-Gardes formed by Napoleon III. are founded upon the latter. The Pope still retains his Swiss guards. In Prussia there is both infantry and cavalry of the guard, and the Russian imperial guard forms an entire corps d'armée 50,000 strong.

In general military use the term guard is of various distinct applications and denotes functions of great importance. It means a sentry on duty, and also a body of soldiers assigned, under the proper officer or officers, to the duty of guarding or protecting a camp, post, or any place where military control is established. Company and regimental details for guard duty are made according to circumstances — the number of men required or available, etc.,— rank of officers being also regarded as far as convenient. Guard-mounting or inspection and review before the old guard is relieved, is a ceremony of much detail and is usually carried out with strict military observance.

Guasa, gwä'sä, or **Warsaw,** a name given in the Gulf of Mexico and West Indian region to various large groupers (q.v.), especially the jewfish (q.v.). "Warsaw" is an anglicized form of the Spanish word.

Guatemala, Republic of (República de Guatemala), the largest country in Central America; bounded on the north by Mexico, British Honduras, and the Gulf of Honduras; on the east and southeast by British Honduras, the Gulf of Amatique, Honduras, and Salvador; on the south and southwest by the Pacific Ocean; and on the west by Mexico. Its area is estimated at 47,810 or 48,290 square miles; its territory extending from lat. 13° 42' to 17° 49' N., and from lon. 88° 10' to 92° 30' W.

Political Divisions.— Guatemala is divided into 22 departments, and each department subdivided into municipal districts, the total number of the latter being 331. Again, for electoral purposes, the whole republic is divided into 38 *distritos electorales.* The following list of the departments and chief towns shows the population and altitude of the latter. The figures given for the number of inhabitants are those of 1903 in the case of Guatemala City, Cobán, and Totonicapam; otherwise the statement is based upon a table carefully prepared in 1897.

Northern departments are: Baja Verapaz (chief town Salamá, population 10,608, altitude 2,827 feet); Alta Verapaz (chief town Cobán, population 24,475, altitude 4,047 feet); El Petén (chief town Flores, population 1,671, altitude 482 feet); El Quiché (chief town Santa Cruz, population 11,914, altitude 5,543 feet); and Izabal (chief town Livingston, population 1,978).

Central departments are: Guatemala (chief town Guatemala City, population 72,102, altitude 4,854 feet); Sacatepéquez (chief town Antigua, or Antigua Guatemala, population 10,150, altitude 4,464 feet); and Chimaltenango (chief town Chimaltenango, population 3,749, altitude 5,666 feet).

Eastern departments are: Jutiapa (chief town Jutiapa, population 11,023, altitude 2,847 feet); Jalapa (chief town Jalapa, population 12,246, altitude 4,625 feet); Chiquimula (chief town Chiquimula, population 12,562, altitude 1,167 feet); and Zacapa (chief town Zacapa, population 11,964, altitude 511 feet).

Southern departments are: Escuintla (chief town Escuintla, population 12,343, altitude 1,269 feet); Amatitlan (chief town Amatitlan,* population 8,408, altitude 3,614 feet); and Santa Rosa (chief town Cuajiniquilapa, population 3,062, altitude 3,254 feet).

Western departments are: Huehuetenango (chief town Huehuetenango, population 10,279, altitude 7,118 feet); Totonicapam (chief town Totonicapam, population 25,196, altitude 7,967 feet); San Marcos, chief town San Marcos,* population 6,036, altitude 7,216 feet); Quezaltenango (chief town Quezaltenango,* population 22,265, altitude 7,419 feet); Retalhuleu (chief town Retalhuleu, population 6,327, altitude 977 feet); Suchitepequez (chief town Mazatenango,* population 6,970, altitude 1,095 feet); and Sololá (chief town Sololá,* population 7,627, altitude 5,940 feet).

The Capital.— Guatemala City, or New Guatemala, which was built after the destruction of Antigua Guatemala in 1776, has a temperate climate, owing to its elevation above the level of the sea. It is a well-planned town, covering a large area; the streets are wide and straight, lighted by electricity, and have lines of street railways. Principal buildings: the palace of the president, city hall, court-house, post and telegraph office, artillery barracks, custom-house, liquor and tobacco bureau, national theatre, college of medicine and pharmacy, university, school of arts and trades, polytechnic school, palace of the archbishop, the cathedral and several other fine churches, the penitentiary, and the hotels. The city has public gardens, telephone and telegraph service, and is connected by rail with the port of San José. Pop. 74,527.

Topography and Physical Geography.— The mountains of Guatemala are commonly referred to as "Cordillera of the Andes," "Guatemalan Andes," or simply "Andes," though there is no propriety in those names. The Andes terminate in northern Colombia, and have no genetic connection with the mountains of Central America. In order to understand the independent character of the latter (so far as the great continental ranges are concerned), we must realize that they are also in their geologic history totally distinct from the Rocky Mountain system, or North American Cordilleras, which terminate in southern Mexico. If the trends of the Andean and Rocky Mountain systems were protracted from their termini (in 70° W. and 97° W., respectively), they would not connect with each other, but would pass the latitude of Guatemala in parallel lines nearly 2,000 miles apart. (See CARIBBEAN SEA; CENTRAL AMERICA; and consult: Hill, 'Cuba and Porto Rico,' Chap. I.). The Guatemalan mountains belong to the Antillean system, which lies between the termini just referred to; its ranges, composed of folded sedimentaries, in eastern Guatemala have an east-and-west trend. But the ranges near the Pacific coast of the republic, crossing the western ends of the Antillean corrugations diagonally, or with a northwest-and-southeast trend, must be assigned to still another class; they form a part of the volcanic chain which extends along the entire western coast of Central America, and is continued in Mexico. The Sierra Madre is the principal range of the west and south; in the central and eastern districts are the Sierra de Chama, Sierra de las Minas, Sierra de Santa Cruz, and the Sierra de Copán — the last named on the frontier of Honduras. The highest points of the Cordillera are given as: Tajumulco volcano (12,600 feet), Tacaná volcano (12,400 feet), both in the southwest; Acatenango volcano (11,100 feet), south-central; and the volcano de Fuego (11,400 feet), also south-central.

Hydrography.— Rivers emptying into the Gulf of Mexico are: the Usumacinta, on the Mexican frontier, and the Cuilco and Salequa, which are also tributaries of Mexican streams. The following empty either into the Gulf of Honduras or Izabal Lake (Golfo Dulce): the Montagua, Rio Hondo, the Dulce, the Belice, the Sarstoon, and the Polochic. Those which flow into the Pacific are: Rio de los Esclavos, Rio de Paz, the Michatoya, Guacalate, Coyelate, Patulul, Nagualate, Samalá, Tilapa, Naranjo, and Suchiate. Steamship navigation has been established on the Dulce and Polochic rivers; seven or eight of the others are navigable for small boats. The most important lakes are: Atitlán and Izabal (both navigated by steamers), Petén, Amatitlán, Ayarza, and Güija (on the frontier of Salvador). Ports on the Caribbean side of the republic are: Puerto Barrios, Livingston, and Santo Tomás — the first two being ports of entry and delivery, while the last is a "minor port," at which importation and exportation are restricted to certain articles. On the Pacific coast the most important ports are: San José, 74½ miles from Guatemala City; Champerico, and Ocós — all ports of entry and delivery, provided with iron piers, etc.

Geology.— The calcareous formations of the Antillean ridges and, generally, the eastern and

---

*Towns damaged or destroyed by earthquakes in 1902.

central regions, deserve special mention. Volcanic products characterize the Pacific slope and Sierra Madre, where they occur in connection with granitic rocks, porphyries and trachytes. See also CENTRAL AMERICA.

Mineral Resources.— Gold and silver are found near the Montagua River and elsewhere; salt in the departments of Alta Verapaz and Santa Rosa. Other minerals reported to exist are: coal, lignite, manganese, lead, tin, cinnabar, copper, kaolin, opals, slate, alum, antimony, marble, alabaster, sulphur, ochre, asbestos, plumbago, chalk, and bitumen. A belt of country extending from the coast range of mountains on the western frontier, near the Pacific, across the Sierra Madre to the coast range of the Caribbean slope, is regarded as essentially a mineral territory, in which there has been comparatively little exploiting or prospecting, though enough to reveal the presence of the precious and base metals.

Climate.— The lowlands of the Pacific and Atlantic coasts are torrid; interior table-lands, at an altitude of 2,000 to 5,000 feet, have an agreeable climate; and the high districts, where the elevation is more than 5,000 feet, are decidedly cool. As is shown in the list of places given under «Political Divisions,» the larger towns are built in the temperate or cool zones. The rainy season, beginning in May, lasts until October in the interior, but sometimes until December, on the coast. December and January are the coldest months; March and April the hottest. Snow sometimes falls (in December or January) on the uplands of the cool zone.

Flora and Fauna.— The very name of the country signified in the Indian language «the land covered with trees.» The rich soil and varying climatic conditions favor a wide range of products in the vegetable kingdom; no systematic classification of these, however, has yet been made. The extent of the forest land, which abounds in mahogany, is estimated at 1,300,000 acres. The fauna and avifauna resemble those of Costa Rica in general, but especially characteristic of Guatemala are the aquatic birds on its rivers and lakes, and the quetzal. Mexican deer are quite numerous. The tapir, honey-bear, armadillo, wild pig, cougar, jagua, etc., are found as in other parts of Central America. The over-abundance of insect life is particularly noteworthy.

Land Tenure.— The most interesting provisions of the Guatemalan laws, to be considered under this heading, are those which relate either to the public lands or more particularly to the aid which the government desired to extend to the cultivators of certain crops. The latter will be stated in the paragraph entitled *Agriculture.* As for the former, the agrarian law of 1894 provided for the sale, lease, and gratuitous concession of the public lands, and created a board of government engineers to survey the said lands and divide them into lots of not more than 15 caballerias each. (One caballeria in Guatemala = 113⅝ acres.) These lots can be purchased from the government at prices ranging from $250 to $500 per caballeria, but no alien is allowed to hold lands situated on the frontier of the republic; or they may be leased (under certain restrictions as to area, duration of lease, and use of the lands) at a rental not to exceed 5 per cent of the selling price; or they may be granted by the president of the republic, in tracts not larger than two caballerias each, to poor persons applying for them, to immigrants, to educational institutions, as a reward for the construction of new roads, etc. Real estate, the value of which does not exceed $1,000, is exempted from taxation. Transfers of unimproved city lots, or of real estate in the country the price of which does not exceed $100, cannot be taxed; and no foreigner can be required, during the first year of residence in the country, to contribute money or personal service for making or repairing roads.

Agriculture.— Coffee grows in the regions between 1,000 and 6,000 feet above the sea-level; sugarcane, between sea-level and 6,200 feet; cacao in the lowlands or those regions having an altitude of less than 3,000 feet. Tobacco, wheat, maize, and beans, are also produced in large quantities. Coffee exports in one year have amounted to 85,373,223 pounds, with a value of $7,390,477 gold. The ordinary annual yield of tobacco is given as 1,000,000 pounds; of cane-sugar, 41,000,000 pounds; bananas, 1,000,000 bunches; and cacao, 200,000 pounds. Stock-raising has been encouraged in the departments of Izabal, Zacapa, Petén, and Alta Verapaz, by decrees authorizing the political chiefs of those departments to make grants of land to persons who establish ranches. Money premiums have been offered to cultivators of india rubber, cacao, sarsaparilla, and hemp; grants of land to those who engage in the cultivation of wheat and bananas. Proprietors of large cotton or tobacco plantations, and reliable day laborers on large plantations of coffee, sugarcane, bananas, or cacao, are exempted from military service. No tax of any kind is levied for 10 years upon plantations of hemp, flax, ramié, cotton, grapes, and one or two other products. Large cash premiums to encourage the production of grapes, hemp, cotton, flax, wheat, and tobacco were offered, particularly during the decade 1886–96; in 1899 the government offered 113⅝ acres of the public lands as a reward for every 20,000 rubber-plants, four years old, planted after 14 Jan. 1899.

Commerce.— Exports to the United States in the fiscal year ending 30 June 1902 were valued at $2,600,000; imports from the United States at $1,680,000. The principal exports for 1901 were: Coffee, 673,344 hundred-weight, sent to Germany, the United States, and Great Britain; sugar, 55,200 hundred-weight, sent to other Central American countries and to the United States; bananas, 262,691 bunches, sent to the United States; hides, 7,018 hundred-weight, sent to Germany and the United States; india rubber, 4,420 hundred-weight, sent to the United States and Germany; timber, 2,155,696 feet, sent to Great Britain and the United States; and other articles valued at $55,000. Of the imports, about one half in value are supplied by the United States, and one quarter by Great Britain, the chief imports being flour, cotton goods, machinery and manufactured iron, and preserved meats and other articles for food. Both exports and imports have increased in value during recent years.

Manufactures.— For the partial supply of local needs a number of small establishments are maintained, the chief industries being the preparation of ramié fibre and the manufacture of coarse textiles, hats, shoes, pottery, cigars,

foundry products, musical instruments, furniture, agricultural implements, and liquors.

Shipping and Navigation.— Steamers of the Pacific Mail Steamship Company call at San José three times each month on the voyages from San Francisco southward. From New York to Puerto Barrios (via Haiti and Jamaica) passengers and freight are carried by two steamship lines. The steamers of the American Fruit Company ply between New Orleans and Puerto Barrios; and in 1903 announcement was made of a new steamship service, the "Guatemala Northern Steamship Line," to operate chiefly between ports on the gulf coast of the United States and Puerto Barrios.

Railways, Roads, Telegraph, etc.— The Central Railway, the first line built in the republic, was completed in 1882. It connects the port of San José with Guatemala City. The Champerico Railway runs from the Pacific port of that name to Retalhulen and San Felipe, a distance of 41 miles. The Ocós Railway, 15 miles in length, connects the wharf at Ocós with the town of Ayutla, near the Mexican frontier. The Ixtapa Railway connects Overo with the old port of Ixtapa (12 miles). The Patulul-Mazatenango Railway has as its terminal points Santa Maria station, on the Central, and San Felipe, passing through Patulul and Mazatenango. The Northern Railroad, which is to connect Puerto Barrios with Guatemala City (and thus, in conjunction with the Central, to supply railway transportation from coast to coast), had completed 159 miles of its road in March 1902. An important highway from Sanarate has been completed, giving access to the northern agricultural districts. The republic has in operation more than 3,000 miles of telegraph wires, 137 kilometres having been added in 1901–2; and the telephone system extends over 250 miles. Receipts from telegraph and telephone lines were greater by $136,042.97 in 1902 than in 1901. The operation of the postal system in 1902 left a considerable surplus in the treasury.

Weights, Measures, and Money.— The French metric system is used, concurrently with the old Spanish system of weights and measures. The latter has: *Onza* (ounce), *libra* (pound, strictly 1.043 pounds), *arroba* (25 *libras*), *quintal* (100 *libras*), *tonelada* (ton 20 *quintals*), and *fanega* (1½ bushels). The monetary unit is the silver *peso* (value in United States gold or silver, $0.384). The money in actual use is paper currency and fractional nickel coins.

Banking.— Six banks are authorized to issue paper, namely: International Bank of Guatemala (Banco Internacional de Guatemala), Colombian Bank (Banco Colombiano), Western Bank (Banco de Occidente), Commercial Bank of Guatemala (Banco Comercial de Guatemala), American Bank (Banco Americano), Guatemala Bank (Banco de Guatemala). All of these, except the Banco de Occidente, have their headquarters in Guatemala City.

Government.— The legislative power is vested in the National Assembly (a single house), whose members (deputies) number one for every 20,000 inhabitants, and are elected for four years by popular vote. The executive power is vested in a president, elected for six years by direct vote of the people. He is responsible for his acts to the assembly, and cannot be re-elected until after an interval of at least one term. The administration is carried on, under the president, by six "secretaries of state," each of whom has charge of a separate department (*ministerio*). These departments are: Government and Justice, Foreign Relations, Public Instruction, Promotion of Public Welfare (*Fomento*), Finance and Public Credit, and War. The council of state is an advisory board, of which certain members are chosen for the assembly and others appointed by the president.

Finances.— The national revenue in 1901 is shown in the following table:

Customs	$8,513,260.88	
Expenditure	7,855.85	
		$8,505,405.03
Liquor excise and government monopolies	$3,775,892.98	
Expenditure	117,687.15	
		$3,658,205.83
Taxes	$1,651,246.55	
Expenditure	72,588.45	
		$1,578,657.10
Total		$13,742,268.96
Deficit from post-office	$110,617.48	
Deficit from telegraph office	193,541.32	
		$304,158.80
Net total		$13,438,110.16
Revenue in 1900		7,974,435.40
Increase in revenue		$ 5,463,674.76

The sum of $14,547,246.72 was appropriated for administrative expenses in the fiscal year extending from 1 July 1902 to 30 June 1903, with the following distribution: Government and justice, $1,874,392; foreign relations, $256,180; treasury, $1,199,986; public credit, $6,000,000; development, $1,458,279; war, $2,006,154.40; public instruction, $1,442,900; other expenditures, $309,376.32. The revenue for the year was estimated at $14,555,000. The total amount of the foreign debt liquidated to 30 June 1902, according to an official statement, was:

Principal on 30 June 1898	$7,216,046
Half of interest from 1898 to 1901, convertible in bonds	432,963
Half of interest to 30 June 1901	288,642
Interest for 1901 to 1902	288,642
Total	$8,226,293

On 31 Dec. 1900 the outstanding amount of the gold debt was $9,231,202, and of the currency debt $27,709,666.

Army.— The army consists of about 7,000 men in regular service; effective army, 56,900 men between the ages of 18 and 30; reserve, 30,000 men from 30 to 50 years of age.

Population.— Full-blooded Indians are much more numerous in Guatemala than in other Central American countries; in fact they, with the Indians of mixed blood, *ladinos* and *mestizos*, make up the bulk of the population. The natural increase among these people is indicated in the report of the secretary of public works for 1901, which shows 66,728 births in that year against 35,618 deaths, a gain of 31,110 persons. The total number of inhabitants in 1903 was about 1,700,000, including 11,000–12,000 foreigners.

Education.— Public instruction, supported by the government, is secular and gratuitous; primary instruction is obligatory; free education is guaranteed by the Constitution. In 1901 there were 1,030 schools in the republic, 455 being for males, 379 for females, 146 mixed, and 50 night schools. In Guatemala City there were 53 schools, of which number 25 were public,

under government inspection; and among the private institutions was a school for boys and girls of the German colony only, endowed by the German government. Higher instruction was given in the capital at the National Institutes (one for men and one for young women), to which normal departments were attached; and similar institutes existed at Quezaltenango (before its destruction) and Chiquimula. There is a separate normal school for young women at Guatemala City, and normal schools for young men at Antigua, San Marcos, and Mazatenango. Schools of law, medicine, and engineering are mainly supported by private funds, but receive aid from the public treasury. Education in music is supplied at the National Conservatory and a number of local schools. There are also trade schools (including one for women) a commercial college, and an art school. The national library contains 30,000 volumes and many valuable unpublished documents. Other libraries accessible to the public are those of the professional schools, the supreme court, national institute for men, and academy of teachers. Public libraries are maintained in the larger towns. The national printing-office at the capital is regarded as one of the best establishments of its kind in Latin-America. More than 30 daily papers and other periodicals are published in the country.

Religion.— The Constitution guarantees liberty of conscience. The government recognizes no creed. The prevailing religion is Roman Catholicism.

Judiciary.— The supreme court of justice consists of a chief justice and four associates, elected by the people. There are six courts of appeal, each consisting of a chief justice and two associates, also elected by the people. Courts of the first instance are 29 in number: their judges are selected by the president among the candidates approved by the chief justice of the supreme court.

Local Government.— The "Political Chief" (*Jefe Politico*) of each department of the republic is appointed by the president, whose authority he exercises in provincial matters. The local officials locally elected are: the *Alcaldes* (one or more for each municipal district) and the *Regidores* (members of the municipal council). *Alcalde* and *Regidor* correspond to mayor and alderman; the *jefe politico* takes the place of a governor, and his relation to the chief executive in a centralized republic fairly indicates the limits within which local self-government is permitted.

History.— Pedro de Alvarado, one of the lieutenants of Cortés, in 1523–4 conquered the country, and on 25 July 1524 proclaimed the sovereignty of Spain at Almolonga, the native town which was afterward to be known as Santiago de los Caballeros. The important fact in connection with this conquest is that it did not lead to the extermination of the natives. Two explanations of this circumstance are offered. Mr. Bancroft says that the Indians, after fighting desperately in defense of their homes, maintained a sullen resistance, and therefore both here and in the adjoining state of Chiapas "the natives probably retain to the present day their original traits with fewer modifications than elsewhere in the Pacific States." But this theory is at variance with the Central American records in general. A suggestion which may be preferred is that the natives of Guatemala were essentially peace-loving agriculturists, not uninfluenced by that civilization which had survived here, as in southern Mexico and Honduras, from very ancient times; that they were allowed to remain undisturbed after the first resistance ceased, while the more warlike tribes, such as those inhabiting Costa Rica and Veragua, were gradually being exterminated. And their descendants in great numbers still possess the land. After the conquest all of the territory now divided up among the Central American countries was included in the captain-generalcy of Guatemala. Independence was proclaimed 15 Sept. 1821; annexation to the Mexican empire under Iturbide followed (5 Jan. 1822). An assembly of representative citizens of Guatemala and the other Central American provinces on 1 July 1823 declared the whole country to be independent, with reference to Mexico, Spain, and all other nations, "whether of the Old or of the New World." Accordingly the United Provinces of Central America came into existence. Guatemala seceded from this union 17 April 1839. The name República de Guatemala was assumed 21 March 1847. Between 1839 and 1851 there was a series of bitter struggles with Salvador for supremacy, fortune favoring the smaller republic; but in the year last mentioned Guatemala began to be successful, and, under the leadership of Rafael Carrera (president until 1856, and subsequently life-president or dictator), carried the war into Salvador (1863) and regained the controlling position in Central America. Carrera appointed his own successor, and died in 1865. The next significant administration was that of Gen. Justo Rufino Barrios, who was put in office by the Liberals, after their onslaught upon the Jesuits. Barillas was elected to the presidency in 1886. In 1890 and 1891 the progress of the country was checked by epidemics of cholera and smallpox. On 15 March 1892 José Maria Reina Barrios was inaugurated as president, and by a decree of the National Assembly (30 Aug. 1897) his term was extended to 15 March 1902 — in direct violation of the Constitution, which was proclaimed in 1879 and modified in 1885, 1887, and 1889. He was assassinated 8 Feb. 1898 by a British subject of German origin. Dr. Manuel Estrada Cabrera was proclaimed acting president, and received the support of the army. An insurrection begun under Gen. Castillo's leadership 28 July was put down, but only to be quickly followed by another revolutionary movement. Insurgent forces commanded by Morales offered a stubborn resistance in the southwest, until Morales was captured. When peace had been restored, Cabrera was the only candidate for the presidency, and his election was announced 25 Sept. 1898. In the following year the government of Guatemala made a proposition which was equivalent to repudiation of a part of its foreign debt, but yielded to Germany's protest — or threat to use force — and withdrew the discreditable suggestion. Earthquakes which occurred in April 1902 caused great damage in several districts. Amatitlan, Mazatenango, San Marcos, Sololá, and San Felipe suffered severely, and Quezaltenango, in importance the second city of the republic, was totally destroyed. An eruption of the volcano Santa Maria followed on 24 October, and there were outbursts from new

craters in November. Several thousand persons lost their lives through these disasters, and the injury to property (plantations, buildings, machinery, and cattle) has been estimated at $5,000,000 to $10,000,000. Taxes for the relief of the earthquake sufferers were imposed by the Legislative Assembly 24 April 1902. A convention between the United States and Guatemala relating to the tenure and disposition of real and personal property was signed 27 Aug. 1901, and ratifications exchanged at Guatemala 16 Sept. 1902.

MARRION WILCOX,
Authority on Spanish America.

Guava, gwä'vä, the name of several tropical plants of the myrtle family which yield delicious fruits. The common guava (*Pisidium guava,* or *pyriferum*) is a low bushy tree, bearing long, fragrant white flowers on solitary axillary stalks, from each of which develops a fruit larger than a hen's egg, roundish or pear-shaped, smooth, yellow; the rind thin and brittle; the pulp firm, full of bony seeds, aromatic, and sweet. The jelly or preserve made from it is highly esteemed, and pleasantly mingles tartness with sweetness. The rind is stewed with milk, and is also made into marmalade. This fruit is rather astringent than laxative. Guava buds, boiled with barley and licorice, make a useful astringent drink in diarrhœa. This guava is now naturalized in all the warmer parts of the world, and in many, especially Ceylon, has run wild. Two cultivated varieties are known, the preferable «white,» and the more showy but less agreeable «red.» Several other species are cultivated; as the mountain guava of the West Indies (*P. montanum*) and the marangaba, a dwarf species (*P. pygmæum*) of Brazil, with fruit no larger than gooseberries.

Guaviare, gwä-vē-ä'rā, or **Guayabero,** gwī-ä-bā'rō, a river of Colombia, South America, which rises in the Cordillera Oriental near Bogota, flows eastward for 750 miles, forms the boundary between the departments of Cundinamarca and Cauca, and joins the Orinoco near San Fernando de Otabapo. It is navigable for nearly five hundred miles.

Guayama, gwī-ä'mä, Porto Rico, town in the southeastern part of the department of Guayama; five miles from the sea. Pop. 5,400.

Guayaquil, gwī-ä-kēl', Ecuador, a seaport city, the capital of the province of Guayas, on the river Guayaquil, 25 miles above its mouth in the Gulf of Guayaquil, on the Pacific Ocean. The site is low and unhealthful, but the sanitary conditions have been improved by a modern system of waterworks, and of drainage. Other modern improvements include street railways, gas-lighting, and telephone service, while a railroad connects with the interior. The chief buildings are the custom-house, town-hall, a college, technical school, and the cathedral. Vessels of 18 feet draught reach the town, and the river and its tributary, the Daule, are navigable for smaller vessels, a considerable distance above the town. The export trade averages $6,500,000 annually, cocoa representing nearly five-sixths, the rest being, coffee, ivory-nuts, rubber, hides, and specie. Cottons, hardware, and other manufactured articles are imported. The industrial establishments include steam saw-mills, foundries, machine-shops, ice factories, and a large brewery. The town was founded 25 July 1531 on St. James' day, whence its official title Santiago de Guayaquil. It has had an eventful history, being attacked by pirates, Dutch, French and English, and suffering from disastrous conflagrations, on the last occasion in 1896. Pop. (1903) 55,000.

Guayaquil, a gulf of the Pacific, in the republic of Ecuador. It has a wide entrance, narrowing as it extends inland, and receiving at its head the Guayaquil River. It contains a number of islands.

Guaymas, gwī'mäs, Mexico, city in the state of Sonora; on the Gulf of California, the terminus of the Sonora Railroad, and the chief Pacific port of Mexico. The principal exports are gold, silver, and hides. Pop. 6,100.

Guayrá (gwī-rä') **Falls,** Brazil and Paraguay, a cascade of the Paraná River, on the boundary between the countries mentioned; the result of a contraction of the river-bed from a width of 4,470 yards into a narrow gorge, 65 yards wide, the waters making a plunge of 56 feet. «These falls, situated in the midst of a desolate region, far from human habitation, and rendered almost inaccessible by virgin forests, rapids, and other obstacles, have been visited by very few, though they are said to form one of the grandest spectacles in the world. The volume of water which passes over them is twice that of Niagara.» Consult 'Paraguay' (2d ed. revised by J. S. Decoud, Honorary Corresponding Member of the International Union of American Republics; Washington: Government Printing Office, 1902).

Gubat, goo'bät, Philippines, a pueblo of the province of Sorsogón, Luzon, on the east coast of the Bay of Gubat, 11 miles southeast of the provincial capital Sorsogón. The waters of the bay were formerly infested by pirates, who terrorized the surrounding region. Pop. 13,300.

Gubernatis, Angelo de, än'jā-lō dā goo-bĕr-nä'tēs, Italian Orientalist: b. Turin 7 April 1840. He founded the Italian Asiatic Society in 1886 and has written much in various departments. Among his works are 'The First Twenty Hymns of the Rig-Veda' (1865); 'Death of Cato' (1863), a metrical drama; 'King Nala,' an Indo-Brahmin play; 'Gabriel,' a novel; 'Zoological Mythology' (1872); and 'Dictionnaire International des Ecrivains du Jour.'

Gudgeon, gŭj'ŏn, a small European fresh-water fish (*Gobio fluviatilis*) of the carp family. It swims in shoals, and affords great sport to anglers from its greediness in seizing upon any bait presented. Its name has therefore come to mean a person easily «fooled» to his hurt.

Gudrun, goo-droon', or **Kudrun,** an old German epic, built up out of the popular songs and traditions of the seafaring people who lived

on the shores of the North Sea between the Elbe and the Seine. It was put into permanent form by an unknown poet of Austria in the latter part of the 12th or early 13th century; and ranks second to the 'Nibelungenlied' in the history of early German literature. It relates the history of three generations of the kings of the Hegelings or Frisians, and in the third part tells how Gudrun, the daughter of Hetel, king of the Hegelings, was carried off from her home by Hochmut, son of the king of Normandy, how she preferred to work like the lowest maidservant in the house of Hochmut's mother, and endure the greatest indignities, rather than break her troth pledged to Herwig, king of Zealand, and how finally she was rescued by her brother and her betrothed.

Guebers, gē'bėrz, also **Ghebers, Gabers, Ghavers, Gebirs** (Turkish Ghaur or Ghiaur, infidel, generally but probably wrongly derived from the Arabic káfir), a name applied by Mohammedans to the adherents of the ancient religion of Zoroaster, who reside in Persia. They originally were subjected by the Mohammedans to much cruelty, but are now permitted a great degree of religious freedom. Those who fled to India are known as Parsis (q.v.).

Guelder (gĕl'dėr) **Rose,** or **Snowball,** a cultivated variety of the *Viburnum opulus,* or water elder, of the order *Caprifoliaceæ.* In the European wild form, the inflorescence is a dense cyme whose outer flowers are barren and enlarged, but in the cultivated form all the flowers are neuter and consequently the plant can never set seed. A yellow dye is obtained from it, and the wood is sometimes employed in making tobacco-pipes and other articles.

Guelders, gĕl'dėrz, or **Guelderland.** See GELDERLAND; NETHERLANDS.

Guelfs, gwĕlfs, or **Guelphs,** and **Ghibellines,** names of rival political parties in Italy during the Middle Ages. The words are of German origin, derived respectively from Welf, the name of a princely family in Bavaria (from which is descended the royal Brunswick line and the line of Este), and Waiblingen, the name of a castle in Würtemberg belonging to Conrad of Hohenstaufen, the German emperor. In the great battle of Weinsberg, 1140, the war-cry of the partisans of Conrad was "Hie Waiblingen," that of the adherents of the Duke of Saxony (of the house of Welf) was "Hie Welf." Some years after when the effort was made by the popes and various states and princely houses of Italy, among them the house of Este, to consolidate opposition to the Emperor, the two German words, changed to Guelfo, Guelfi (plus), and Ghibellino, Ghibellini, were adopted as party designations by the Italians. At first and for a long time after the assumption of these names by the great parties in Italy, Guelf and Ghibelline, did really designate two opposing national policies — the policy of the dependence of the several states of the Peninsula on the Empire, and the policy of Italian independence of Germany, and of resistance to imperial absolutism. The states of northern and of central Italy were divided in their allegiance and they were continually passing from one side to the other, but they were predominantly Ghibelline; the states of southern Italy were always Guelf. The popes were the mainstay of the Guelf party and thus were the assertors of the policy of Italian independence and home rule. As usual with party designations, "Guelf" and "Ghibelline" continued in use as the names of factions in no wise concerned with the question of imperialism.

Guell y Rente, Jose, hō-sā' goo-ely' ē rān-tā', Cuban author: b. Havana, Cuba, 14 Sept. 1818; d. Madrid 20 Dec. 1884. He studied law in Havana and Barcelona and practised his profession in his native city. In 1848 he went to Spain where he married Josepha de Bourbon, sister of the king. Besides several novels he published 'Philippe II. et Don Carlos devant l'histoire' (1878), and other works.

Guelph, gwĕlf, Canada, city and county-seat of Wellington County, Ontario; on the river Speed, and on the Grand T. and Canadian P. Rys., 48 miles west of Toronto; founded by John Galt (q.v.). The river affords abundant water power and the city, in a rich agricultural and cattle-raising district, enjoys a large trade. It is an inland port of entry and is the seat of a United States consulate. It has breweries, large flour, saw, and planing-mills, and manufactories of foundry products, machinery, pipe and tubing, musical instruments, sewing-machines, agricultural implements, woolen goods, carpets, furniture, carriages, leather, soap, boots and shoes, etc. Good building stone is quarried in the vicinity. Guelph has in addition to the county buildings, 4 colleges, 16 churches, substantial business blocks, banks, a library and reading-room, and daily and weekly newspapers. The city owns and operates its electric light, gas and power, its water-works and street railway. It is the seat of the Ontario Agricultural College (q.v.) and the Provincial Experimental Farm. Pop. (1901) 11,496; (1904 est.) 12,500.

Guelphs, Order of, frequently styled the **Guelphic Order,** an order of knighthood instituted for the kingdom of Hanover in 1815 by the prince-regent of England and Hanover, afterward George IV. of England, and conferred by the kings of Hanover until the absorption of that kingdom by Prussia in 1866.

Guemal, gwā'mäl, either of two species of small Andean deer (*Cervus chilensis* or *C. antisensis*), whose antlers have only one forking — a long brow-tine projecting straight forward; which have tusks in the upper jaws in both sexes; and whose fawns are not spotted.

Guerber, Helene Adeline, American author. Her books include: 'Empresses of France'; 'Legends of the Middle Ages'; 'Legends of the Rhine'; 'Myths of Greece and Rome'; 'Myths of Northern Lands'; 'Story of the Thirteen Colonies'; 'Story of the Great Republic'; 'Story of the Greeks,' etc., etc.

Guercino da Cento, gwĕr-chē'nō dä chĕn'-tō, Italian painter: b. Cento, duchy of Ferrara, 1590; d. Bologna 1666. His proper name was GIOVANNI FRANCESCO BARBIERI, and he was called Guercino from a squint in his eyes. In 1621, having already acquired renown as a painter, he was invited by Pope Gregory XV. to Rome, but the premature death of this pontiff induced him to return to his native town two years after. About 1642 he went to Bologna, where Count Aldovrandi received him in his palace and entertained him with the most magnificent hospitality. Guercino adopted three different manners of painting, the first in imitation of Caravaggio, which being very dark, he

quitted for that of the Caraccis, and latterly for a style still more light and sketchy; but his middle style is his best. His chief pictures are at Rome. The most celebrated is that of the 'Martyrdom of Saint Petronilla,' which has been copied in mosaic to adorn one of the panels in Saint Peter's between the 'Transfiguration' by Raphael, and the 'Communion of St. Jerome,' by Domenichino. His other chief pictures include a 'St. Anthony' at Padua; an 'Annunciation' at Milan; 'St. Peter' at Modena; 'Cephalus and Procris,' and a scene from the 'Pastor Fido' in the Dresden gallery; the 'Parting of Priam and Hector' at Marseilles. The galleries of Bologna, Florence, and Paris, besides some of those of England and Germany, also possess specimens of this master.

Guereza, gĕr'ĕ-za, or **Guerza,** gĕr'za, (*Colōbus guerza*), an Abyssinian monkey remarkable for its beauty. Short, glossy, jet-black fur covers its limbs, back and head, while a long fringe of silky white hair depends from the flanks. It frequents lofty trees and is much sought for the sake of its valuable fur.

Guérin, Eugénie de, ė-zhā-nē dė gā-răṅ, French writer: b. Cayla, Languedoc, 1805; d. 31 May 1848. She was a sister of G. M. Guérin (q.v.) and much of her life was devoted to taking care of him. Her 'Journals and Letters,' of which an English translation appeared (1865–6), have been widely read in America, both for their charm of style and their devotional spirit. See Parr, 'Maurice and Eugénie de Guérin' (1870).

Guérin, Georges Maurice, zhŏrzh mō-rēs, French poet: b. Languedoc 4 Aug. 1810; d. Paris, 19 July 1839. He was for a time a member of a religious house in Brittany, but in 1833 went to Paris and taught in the Collège Stanislas. His verse has been greatly admired by critical readers. Sainte Beuve in 1860 edited his 'Reliquæ' with critical notice, and the poet forms the subject also of one of Matthew Arnold's 'Essays in Criticism' (1865). See Parr, 'Maurice and Eugénie de Guérin' (1870).

Guernsey, gėrn'zĭ, **Alfred Hudson,** American editor: b. Vermont, 1825; d. 17 Jan. 1902. He was for several years editor of 'Harper's Magazine,' and he was also associate editor of the 'American Cyclopædia' (1872–6). With Henry M. Alden he was author of 'Harper's Pictorial History of the Great Rebellion,' writing the Eastern campaigns (1862–5); and 'The Spanish Armada' (1882).

Guernsey, Egbert, American physician: b. Litchfield, Conn., 8 July 1823; d. Fishkill Landing, N. Y., 19 Sept. 1903. He was graduated from the medical department of New York University in 1846, founded the Brooklyn *Daily Times*, and in 1872 became editor of the 'Medical Times.' He was also president for many years of the Metropolitan Hospital of New York, and published 'Domestic Practice' (1855), which has passed through 11 editions.

Guernsey, the second largest and westernmost of the Channel Islands (q.v.), 46 miles southwest of Cherbourg, France, and 68 miles from Start Point, Devonshire, England. It is triangular in form, nine miles long and from three to four miles broad. The picturesque south coast is lofty and abrupt, the island sloping towards the north which is low and level. Guernsey is noted for its healthful climate, for the fertility of its soil, for its horticultural and floricultural products grown chiefly under glass, and for its magnificent breed of cattle. The chief towns are St. Peter Port (q.v.), the capital, and Saint Sampson, the latter with an important export trade in blue granite. With the adjacent islands of Sark, Alderney, Herm and Jethow, Guernsey forms an autonomous bailiwick. Pop. (1903) 41,000.

Guerrero, Teodoro, tā-ō-dō'rō gĕr-rā'rō, Cuban dramatist: b. Havana 9 Nov. 1824. He was educated in Spain, returning to Cuba in 1845, in which year his first volume of poems, 'Teordorelas,' was published. His comedy, 'La Cabeza y el Corazón' ('The Head and the Heart'), was successfully performed at Havana in 1861, and 'Lecciones do Mundo' ('The Lessons of the World'), didactic verse, reached many editions. The author published other dramas and several works of fiction and was active in Cuban educational affairs.

Guerrero, Mexico, a state bounded by the states of Morelos and Mexico on the north, Puebla on the northeast, Oaxaca on the east and southeast, and by the Pacific Ocean on the southwest. Its area is given as 64,756 square kilometres, or 24,926 square miles. It is mountainous throughout almost its entire extent, the northern section being occupied by the spurs of the ranges of Morelos and Mexico, and the southern by the Sierra Madre del Sur (highest peaks 2,800 metres). Between these two sections runs the Mexcala or Balsas River, to which all the streams of the state are tributary. The principal lakes are Pazahualco, Chantengo, San Marcos, and Nexpa. The Pacific coast line is low and sandy, and has excellent harbors. The bay of Acapulco, the chief port, is deep and spacious. The mineral resources of the state have been as yet very imperfectly developed. Gold, silver, lead, mercury, iron, coal, sulphur, marble, granite, opals, topazes, and diamonds are mentioned among its products. The climate is unhealthy. On the coast the heat (from 95° to 96.80° F.) and rainfall are both excessive; and in the belt above 6,500 feet, the cold is sometimes severe. Fevers, leprosy and affections of the respiratory and digestive organs are the prevailing diseases. The annual value of the agricultural products is about $2,200,000, and the total value of live stock is estimated at $3,000,000. Manufactures are limited to sugar-cane products, mescal wine, palm-oil, cotton fabrics, and leather. Plans for a number of railways have been made, but have not been carried out. There are, however, telegraph and telephone lines, and a few wagon roads. Steamers of the Pacific Mail and the Mexican International Company touch at Acapulco. The state is divided into 14 districts: La Unión, Mina, Alarcón, Hidalgo, Alvarez, Zaragoza, Morelos, Abasolo, Allende, Tabares (chief town Acapulco de Juarez, with population of 5,780), Galeana, Chilpancingo (principal town and capital of the state Chilpancingo de los Bravos, with population of 6,321), and Guerrero. Total population of the state 420,336.

Guerrilla, gė-rĭl'la, an irregular mode of carrying on war by means of small independent bands of armed men, self-constituted and un-

connected with the regular army. The name originated in the Spanish war for independence (1808–14), when the term guerrillas was applied to the bands of Spanish peasants, organized to harass the French armies that then occupied Spain. Guerrilla warfare was carried on to some extent during the Revolution and also in the Civil War, particularly by the Confederates. Guerrilla methods were also effectively used by the Cuban patriots in Cuba's war for independence.

Guesclin, Bertrand du. See Du Guesclin.

Guest-bees, a large genus (*Nomada*) of little bees of both Europe and America, which lay their eggs in the nests of burrowing bees of the genera *Andrena* and *Halictus,* where the young share the food gathered for the young of their hosts, and the adults live harmoniously together,— apparently a case of partnership rather than of parasitism. Compare Cuckoo-Bee.

Gug'genheimer, Randolph, American lawyer and politician: b. Lynchburg, Va., 20 July 1848. He studied at New York University and began his business career as clerk in a woolen goods house in New York. He later entered a law office, studied law, was admitted to the bar, and became the head of a law firm, which has been particularly successful in important negotiations with English syndicates, investing capital in American industries. He has also been active in the political life of the city as a Democrat; was a member of the board of education for three years; and was also president of the board of aldermen, in which capacity he served as acting mayor of Greater New York.

Guiana, ge-ä'nä, the name applied to all that tract of country in South America bounded by the Atlantic Ocean, the Amazon River and its branches, and the Orinoco River and its branches. It lies between lat. 8° 40' N. and lat. 3° 30' S., between lon. 50° and 60° W. Its greatest extent east and west is 1,090 miles; its greatest breadth, from Punta Barima, to the confluence of Rio Negro with the Amazon, is 710 miles. The total area is more than 800,000 square miles. The western districts belong to Venezuela; the southern and eastern districts to Brazil. The three European colonies, the British, Dutch, and French Guianas, extend from the seacoast to the frontiers of those republics.

Early voyages to this part of South America are mentioned in the article Discoveries, etc. The first settlements on the northern coast lay much farther toward the west, and exploration and colonization east of the Orinoco began when European adventurers continued in this new field their search for Eldorado. Spanish and Portuguese expeditions into Guiana during the 16th century were very numerous, but always disastrous. The English undertook its conquest, believing, in the words of Sir Walter Raleigh, "that whatever prince shall possess it, that prince shall be lord of more gold, and of a more beautiful empire, and of more cities and people, than either the king of Spain or the great Turk." Capt. Laurens Keymis, sent by Raleigh in 1596 to explore the region, reported that "the like occasion seldom happeneth in many ages." In the articles, Dabaiba and Eldorado, it is shown that the birthplace of the Eldorado myth was the region now known as Colombia, and that the time of its birth was near the beginning of the 16th century; but in the course of 100 years the site of Eldorado was transferred to central Guiana, and Schomburgk asserts that the possibility of its existence in that locality continued to occupy the imagination and attention of adventurers until the close of the 18th century. Humboldt was the first to prove that a lake "like unto Mare Caspium," as Raleigh described it, no longer existed, and it was erased from the maps; Schomburgk identified the locality where it was sought with the small lake Amucu near an Indian village named Pirara. Raleigh led several armaments from England with the hope of conquering the golden capital. When these undertakings ended in disappointment, Capt. Keymis committed suicide, and Raleigh "paid the forfeit of his illusions with his life upon the scaffold." Dutch traders, who arrived about 1580, settled on the Pomeroon and Essequibo rivers; and after the establishment of the Dutch West India Company land on the Berbice River was granted to van Peere. The Pomeroon colony was abandoned owing to attacks by the English in 1666 and by French privateers. In 1740 English planters from the West Indies established themselves on the Essequibo, as a result of the "open door" policy adopted by the Dutch with respect to that region alone. Next, the overflow of immigration settled in the Demerara district; and in 1781 all three colonies, Essequibo, Demerara, and Berbice, were taken by the British. Recaptured before the year was out by the French (who were then allies of the Netherlands), they were again taken by the British in 1796. The peace of Amiens restored the original status; but English troops interposed once more, and the colonies were ceded to Great Britain by the treaties of 1814–15. They were united in 1831, forming British Guiana.

In the region east of Berbice, a few English people attempted to form a colony at the village of Paramaribo (1626), but abandoned the project. Ten years afterward the French invested Paramaribo, but relinquished it, proceeded to Cayenne, and there founded what is now known as French Guiana. In 1652 a body of English settlers again arrived at the Coma River, and succeeded in establishing themselves. This colony was granted in 1662 by Charles II. to Lord Willoughby, who changed the name Coma River into Surryham, in honor of the Earl of Surrey. Hence we have "Surinam," the name often used instead of Dutch Guiana. The British crown bought the colony from the heirs of Lord Willoughby, but it passed into the hands of the Dutch about the time when Holland gave up the attempt to keep New Amsterdam, now New York. The statement often repeated, that Surinam was "exchanged" for New Amsterdam is incorrect.

1. British Guiana is situated approximately between lat. 1° and 8° 40' N. It is bounded on the north and northeast by the Atlantic Ocean, on the east by Dutch Guiana, on the south by Brazil, and on the west by Brazil and Venezuela. Its area is 104,000 square miles. The old settlements of Essequibo, Berbice, and Demerara form counties with the same names. Of these, Demerara contains the capital of the colony (see Georgetown); Essequibo, the town

of Bartica, the point of departure for miners going to the gold-fields; and the capital of Berbice County is New Amsterdam. One of the chief points on the new boundary line with Venezuela, Mount Roraima, is an immense sandstone mass rising with perpendicular sides 2,000 feet above the slopes (themselves 6,000 feet above sea-level) which form its base. Some of the neighboring mountains resemble it in form, but are less imposing. Midway between this group and the Atlantic coast is the Imataca range, extending east-southeast to the confluence of the Cuyuni and Essequibo. The latter with its tributaries drains nearly the whole interior of the colony; the Demerara, though much smaller, is more important, because it flows through the region which has become the centre of population; the Corentyne is the boundary between British and Dutch Guiana.

Geology and Mineral Resources.— The original sea beach is found far inland, where it now appears as long stretches of white sand reefs, the sand being derived from a barrier of primary, volcanic and metamorphic rocks, which impedes the navigation of the rivers. The strip between this barrier and the ocean front — composed of layers of soft mud, clay, sand, broken shells, and decomposed vegetable matter — is really an enormous mud-flat, about 100 feet in depth, and covered with a rich, heavy loam, and in places, with a kind of peat called pegass. The whole interior of the country, between the agricultural coast-strip and the range culminating in Roraima, is an auriferous region. The gold is commonly found in combination with silver. Quartz-mines have been worked in upper Demerara, but placer-mines in the beds of former streams or the channels of existing ones are more usual. Other mineral products are iron, sapphires, diamonds, mercury, garnets, antimony, and plumbago. A sandstone formation characterizes the southwest, from Mount Roraima to the Potaro and Essequibo rivers, thence extending eastward across the Demerara, Berbice, and Corentyne. The sandstone is interbedded with volcanic rocks. In many parts of the colony there are red, yellow, and blue clays; and fine white clay, suitable for the manufacture of porcelain, is also found.

Soil and Climate.— The surface of the coast alluvium is so fertile that alternation of crops is not required; it is, however, very heavy and hard to cultivate. The thermometer ranges generally from 76° to 86° F., with little difference in this respect between day and night. Rainfall in some years 130 inches, in others not more than 70 inches. The year is divided into two rainy seasons (November–February and May–July), and two dry seasons. Neither destructive earthquakes nor hurricanes occur. There has been only one serious outbreak of yellow fever during 50 years. Death rate of the colony about 35 per 1,000.

Flora and Fauna.— Characteristic forest products are exceedingly hard and heavy woods. The greenheart, mora, and wallaba are valuable for building; the simaruba, letter-wood, and crabwood, for making furniture, etc. Vegetation in Guiana is remarkable on account of the altitude of the trees and the great size of leaves and flowers. The gigantic water-lily, Victoria Regia, is very common. Some of the orchids form large masses, with flower-stems 12 feet high. Common mammals are sloths, deer, ant-eaters, tapirs, armadillos, peccaries, jaguars, cavies, and ring-tail monkeys. Monkeys belong to two families which are entirely confined to this region, and bats develop here their most extraordinary specializations. In some parts of the forest vampires are "ready to suck the foot or even the cheek of the unwary traveler." The manatee (*vulgo* "mermaid" or "water-mamma"), inhabiting some of the large rivers, and coming to the surface at intervals to breathe or to graze on the plants which line the banks, owes its popular designations to the circumstance that it suckles its young at the breast. The representative families of birds are, with few exceptions, peculiar to this region, the list of such birds including greenlets, tanagers, hang-nests, sugar-birds, tree-creepers, manakins, and cotingas. Alligators and boa constrictors both attain to great size in this region; iguanas and smaller kinds of lizards are numerous. Among the insects, the variety of genera and species can, it is thought, scarcely be equaled in any other part of the world. Uncommon brilliance of coloring is characteristic of both the birds and the insects.

Agriculture.— About 80,000 acres are under cultivation, or, say, one acre out of every 100 available for the purpose; and of this amount 71,766 acres are in sugar plantations. Only a very small portion is devoted to coffee and cocoa.

Commerce, Shipping, Railways, etc.— The chief imports in 1901–2 were tissues, flour, machinery, manures, rice, fish, hardware, coal, and tobacco, cigars, and cigarettes. The total value of imports (principally from Great Britain and British possessions) was $7,073,845. The chief exports in the same year, with their values: Sugar, $5,190,815; gold, $1,857,460; rum, $804,230; balatta, $118,265; timber and woods, $105,605; diamonds, $95,275; charcoal, $35,930; and molasses, $24,015. The total value of exports was $9,168,120. In 1901 the registered vessels belonging to British Guiana numbered 48, comprising 32 sailing vessels (1,497 tons), and 16 steamers (2,213 tons). Total tonnage entered and cleared, in 1901–2, was 725,867. (See also routes of vessels under GEORGETOWN.) There are 108 miles of railways, 264 miles of good roads, and 12 miles of the larger sort of canals, used for navigation. Smaller canals, to carry off superfluous water from the plantations, intersect each other in every direction. The heavy rainfall and the flatness of the coast region oblige the planters to maintain these canals to provide drainage, and by means of the larger draining trenches the sugarcanes are taken to the mills in punts. There are 73 post-offices, 46 telegraph offices, 9 traveling post-offices, about 559 miles of telegraphs and cables, and telephone services (677 miles) in Georgetown and New Amsterdam.

Money and Banking.— British gold and silver are used. There are 25 savings banks, with 21,266 depositors, and 2 banks with note circulation.

Government.— The governor is assisted in executive and administrative matters by an advisory council, composed of 3 colonists and 3 officials, all appointed by the king of England; in legislative matters by the Court of Policy (7 officials beside the governor, and 8 elective members, chosen from inhabitants by constituency of 2,676 voters qualified by income or property). The governor has a casting vote, and can decide

any question against the votes of the representative members. The colonists are in the majority, however, in the Combined Court, which votes the taxes and public expenditures.

Finances.— Total revenue for the year 1901–2 was $2,657,535, derived mainly from customs, licenses, duty on rum, and royalty on gold. Public expenditures in the same year amounted to $2,613,155. The public debt in 1901 was $4,960,600.

Population, Schools and Judiciary.— The census of 1891 showed: Negroes, 115,588; East Indians (Hindu coolies), 105,465; aboriginal Indians, about 17,463; Portuguese from Madeira, 12,166; whites of other nationalities, 4,558; Chinese, 3,433; mixed races, etc., 29,376. The total number of inhabitants was therefore 288,049. In 1901–2 the schools, numbering 213, had 26,684 pupils. There are three judges, and, in the several districts, a number of magistrates. The criminal law is based on that of England; in civil cases the Roman-Dutch law is applied, with certain modifications.

History (including the boundary dispute with Venezuela).— Prohibition of the slave trade checked the agricultural development of the colony, and emancipation of the slaves (1838) ruined many planters, the freed negroes demanding higher wages than the planters could afford to pay. This crisis led to the introduction of large numbers of laborers from Madeira, the East Indies, China, and Malta. Immigrants of a different class began to arrive about 1886 in consequence of the rediscovery of gold; but serious difficulties arose precisely on account of the enhancement in the value of the auriferous regions, some of the most promising of which were located in the territory west of the Essequibo claimed by both Venezuela and Great Britain. The inland limits of the Spanish (afterward Venezuelan), the British, the Dutch, the French, and the Portuguese (afterward Brazilian) Guianas were undetermined. In 1841 Schomburgk surveyed the boundary line of British Guiana for the British government, and made two maps; the second or revised map placing the boundary with Venezuela much farther toward the west than the first. Subsequently Venezuela and Great Britain agreed not to encroach upon the territory in dispute, pending a settlement of the boundary question, but both countries offended against the spirit of this compact. The proposal for arbitration in 1887 was met by England's prompt refusal to admit any doubt as to her title to the lands east of the revised Schomburgk line, and, a little later, by the establishment of British posts, and the declaration that the region drained by the Barima River was hers by right. It is necessary to bear in mind that if England had accepted the views of Venezuela and Brazil as to the boundaries of British Guiana, that colony would have disappeared from the map. Brazil claimed all but about 12,000 square miles; Venezuela nearly the whole of the old Essequibo colony, the Pomeroon and the unsettled interior districts. When President Cleveland, in 1895, called to the attention of the British government the bearing of the Monroe doctrine upon the question at issue, his suggestion was at first not accepted. His message to Congress went much farther. It advised Congress that a commission should be appointed for the determination of the true boundary, and declared in effect that any attempt to extend British territory beyond the true boundary should be resisted by the United States, by force, if necessary. It was a threat of war. Pursuant to the act of Congress 21 Dec. 1895, a commission was appointed 1 Jan. 1896. But before their report was submitted a treaty providing for the reference of the matter to a tribunal of arbitration had been signed at Washington (2 Feb. 1897). Arbitrators were: Chief Justice Fuller and Justice Brewer of United States Supreme Court; Lord Herschell (and, after his death, Lord Russell of Killowen), and Justice Sir R. H. Collins; and as president, Prof. Martens. The tribunal met at Paris in 1899. The award, given 3 October, determined the boundary nearly in correspondence with the second or revised Schomburgk line, assigning to Great Britain a region about 60,000 square miles in area which Venezuela had claimed. On the other hand, Point Barima, at the principal mouth of the Orinoco, and certain gold-fields near the headwaters of the Cuyuni, were awarded to Venezuela. The territory of British Guiana, thus defined, extends along the seacoast to Point Playa, and includes the whole valley of the Barima and that of the Cuyuni east of the Wenamu — the larger part, though not the best part, of the mining region.

2. Dutch Guiana or Surinam is bounded on the north by the Atlantic Ocean, on the east by French Guiana, on the south by Brazil, and on the west by British Guiana. It extends from lat. 2° to 6° N., and from lon. 53° 50′ to 58° 20′ E. Area 46,060 square miles. The political divisions are districts, 16 in number, and communes; the capital, Paramaribo, has about 31,817 inhabitants. Chief products are: Cacao (75 plantations), sugar (7 plantations), coffee, bananas, rice, maize, rum, molasses, and gold (output valued at about $480,000 in 1900). The mining experience of this colony resembles that of British Guiana: the metal has been sought hitherto in beds of streams, etc., but is now being taken also from mines which require crushing machinery. Imports regularly exceed in value the exports; thus in 1901 imports amounted to $2,831,112, and exports to $2,146,224. During the years 1897 to 1901 the value of exports remained almost stationary, while that of imports steadily increased. Executive authority is vested in a governor. The representative assembly, called the Colonial States, is composed of members chosen for 6 years by a limited number of electors. The council consists of 5 members, including the governor himself as president, and represents the sovereign. The revenues of the colony fall short of the expenditures. The military force is about as follows: Garrison, 20 officers and 351 men; militia, 27 officers and 411 men; and civic guard, 59 officers and 1,061 men. There are a few guard ships and vessels of the royal navy. The number of inhabitants in 1902 was somewhat more than 69,000. Educational institutions are: A normal school; schools maintained by the Moravian Brethren and the Roman Catholics; 33 private schools, with 4,822 pupils; and 20 public schools, with 2,342 pupils. The judicial system comprises a court of justice (all the officers appointed by the queen), two circuit, and three district courts. Slavery was abolished 1 July 1863, but the authorities imposed the con-

ditions that for 10 years the emancipated negroes should remain upon the plantations of the districts in which they had formerly lived, and should perform the same kind of work for wages that they had been accustomed to while in bondage. After 1 July 1873, the importation of laborers to replace the freedmen became a matter of life and death in Surinam as in the neighboring colonies, for agriculture was almost ruined.

3. French Guiana, lying between the Atlantic Ocean, Brazil, and Dutch Guiana, has an area of about 30,500 square miles. Besides Cayenne, capital of the colony, and its only port (population, according to the latest census, 12,612), there are 13 communes. Mineral productions are gold, silver, marble, phosphates, and iron. In 1901 the exports of gold amounted to 94,147 ounces. Agricultural productions are varied (including sugarcane, cocoa, coffee, rice, indigo, tobacco, maize, and manioc), but laborers are few, the area under cultivation is small, and the total value of the crops insignificant. Here, as in Dutch Guiana, the value of exports is much less than that of the imports, the difference in 1901 being about $689,750. Colonial interests are entrusted to a governor and privy council of 7 members, and one deputy represents the colony in the French Parliament. There is also an assembly called the Council-General, composed of 16 members. Revenue and expenditures for 1902 were each estimated at $657,261; but the cost of maintaining the penal establishment ($1,139,122, according to the budget of 1903), is borne by the French republic. Between 300 and 400 French soldiers are kept in the colony. The total population, including convicts and Indians, was given as 32,908 in 1901. Cayenne has a superior court, court of first instance, and two justices of the peace; a college, a library, and a museum; in the entire colony there are 27 primary schools

From the first, the French undertaking in Guiana has been unsuccessful. On 11 Dec. 1653, the survivors of the original colony abandoned the fort and sailed away, after suffering from hunger and disease. A new company formed for the colonization of Cayenne in 1663 was scarcely able to hold its own against hostile neighbors in Brazil. The deportation of political prisoners to Guiana at the end of the 18th century completed the ruin which Portuguese attacks had begun; for the exiles ascribed the death of their companions to the climate; and French Guiana was completely discredited in the eyes of the world. In January 1809, the colony surrendered to the Portuguese and English. It was restored to France by the treaties of 1814–15. Since 1855 it has been used as a penal settlement. In 1902 the number of convicts in residence there was 10,075, including 240 women. The boundaries with Brazil were determined 1 Dec. 1900, by the Swiss court of arbitration.

Authority on Spanish America.

Guicciardini, Francesco, frän-chěs′kō gwē-chär-dē′nē, Italian historian: b. Florence 6 March 1483; d. there 23 May 1540. He studied at Padua, and became an advocate and professor of law at Florence. In 1512 he was appointed ambassador to the court of Ferdinand the Catholic of Spain. At a later period he was invited by Leo X. to his court, and entrusted with the government of Modena and Reggio. This office he discharged also under Adrian VI., to the general satisfaction; and afterward, when Clement VII. (de' Medici) ascended the papal chair, Guicciardini was sent as lieutenant of the pope to Romagna. He contributed here to the public good by restoring civil order, constructing roads, erecting public buildings, and founding useful institutions. Having been appointed lieutenant-general of the pope, he, in 1521, defended Parma when besieged by the French. In 1534 he began his great work ‘Istoria d'Italia’ (1561-4) extending from 1490 to 1534. In 1537 he contributed greatly to the elevation of Cosmo de Medici to the office of grand-duke, but when later he attempted to impose constitutional limitations upon the grand-ducal power, he lost his influence. The ‘History’ was translated into English by Goddard, and the translation published between 1753 and 1761. The reader of Guicciardini is sometimes offended by a want of method, and his statements cannot always be depended on as derived from the best sources.

Guide-birds, or **Honey-guides,** certain small, mainly black and yellow birds, allied to the barbets, and constituting a genus inhabiting the tropical regions of the Old World, which have the curious habit of attracting the attention of men, and of honey-loving quadrupeds, to bees' nests, profiting by the disturbance which follows. They are fond of bees, grubs, and honey, but cannot often get them without assistance; sometimes, also, they show equal zeal in leading a person to a snake, leopard, or something else which has attracted their notice. Although the genus is known in India and Malaya, it is in South Africa that its traits are most noticeable and the books of travelers and explorers there abound in accounts of its guiding habits. Sir John Kirk contributed the following exact description of the work of *Indicator minor* to the ‘Ibis’ (1864):

“The honey-guide is found in forests, and often far from water, even during the dry season. On observing a man it comes fluttering from branch to branch in the neighboring trees, calling attention. If this be responded to, as the natives do by whistling and starting to their feet, the bird will go in a certain direction and remain at a little distance, hopping from one tree to another. On being followed it goes further; and so it will guide the way to a nest of bees. When this is reached, it flies about, but no longer guides; and then some knowledge is needed to discover the nest, even when pointed out to within a few trees. I have known this bird, if the man after taking up the direction for a little then turns away, to come back and offer to point out another nest in a different part. But if it do not know of two nests, it will remain behind. The difficulty is, that it will point to tame bees in a bark-hive as readily as to those

in the forest. This is natural, as the bee is the same; the bark-hive, ‘musinga’ as it is named, being simply fastened up in a tree and left for the bees to come to. The object the bird has in view is clearly the young bees. It will guide to nests having no honey, and seems equally delighted if the comb containing the grub be torn out when it is seen pecking at it.”

Guido Reni. See Reni, Guido.

Guido Aretino. See Aretino, Guido.

Guidon, gī'dŏn, a swallow-tailed flag, such as is carried by a regiment of cavalry or mounted artillery. In the United States cavalry the regimental guidon is half red and half white, dividing at the fork. The red above has “U. S.” in white. The white is below, and has the letter of the company in red. The fly is 3 feet 5 inches to the end of the tail; the head is 27 inches. The lance is 9 feet long, including spear and ferrule.

Guienne, gē-ĕn', or **Guyenne,** ancient Aquitania (q.v.), a former southwestern province of France, now divided into the departments of Gironde, Lot, Lot-et-Garonne, Dordogne, Aveyron, and part of Landes and of Tarn-et-Garonne. The capital was Bordeaux.

Guija, gwē'hä, a lake in the republics of Guatemala and San Salvador, in Central America. It is in a volcanic region, and contains two small volcanic islands.

Guikowar, gīk'wär, the native title of the Mahratta prince, ruler of the province of Baroda (q.v.) in British India. The ruling Guikowar in 1874 was tried for attempting to poison the British resident and was deposed. Since 1802, when the province lost its independence to the English, the authority of the Guikowar has been merely nominal.

Guild, Curtis, American journalist: b. Boston, Mass., 1827. After several years devoted to reporting for the Boston *Journal,* he became one of the owners of the Boston *Traveller* and in 1859 established the Boston *Daily Commercial Bulletin,* of which he became the editor. He has published ‘Over the Ocean’ (1867); ‘Aboard Again’ (1873); ‘Britons and Muscovites’ (1888); ‘A Chat About Celebrities’; ‘From Sunrise to Sunset’ (verse).

Guild, Curtis Jr., American journalist and politician: b. Boston, Mass., 2 Feb. 1860. He was graduated at Harvard in 1881 as class orator, and entered the employ of the *Commercial Bulletin* of Boston, conducted by his father, Curtis Guild (q.v.). He interested himself at once in local politics, was Republican delegate-at-large to the St. Louis convention in 1896; and active in securing the gold plank in the national platform. In the following campaign he made a political tour of 10 States. He was appointed brigadier-general of Massachusetts militia and inspector-general of rifle practice by Gov. Roger Wolcott. At the outbreak of the Spanish war he was appointed lieutenant-colonel and inspector-general, United States Army, serving in the Seventh Army corps under Gen. Fitzhugh Lee. In 1900 he accompanied Gov. (now President) Roosevelt on a tour of political speaking through the West. In 1902 he became sole owner of the *Commercial Bulletin.* He was elected, 4 Nov. 1902, lieutenant-governor of Massachusetts, with John L. Bates, governor-elect; and was inaugurated 10 Jan. 1903. In 1905 he was elected to the governorship.

Guild, Reuben Aldridge, American librarian and author: b. West Dedham, Mass., 4 May 1822; d. 1899. His published works include: ‘Biographical Introduction to the Writings of Roger Williams’ (1866); ‘History of Brown University with Illustrative Documents’ (1867); ‘Chaplain Smith and the Baptists’ (1885).

Guild, a fraternity, society or company, formerly active in commerce and mechanics. Guilds played an important part in public affairs in the Middle Ages. The Romans had various mechanical fraternities, but these seem to have been merely religious and political societies; while the associations of workmen in the arsenals that existed under the empire were regular hereditary castes, enjoying certain privileges and bound to certain duties. In Italy, the cradle of the class of free citizens in the Middle Ages, and particularly in the Lombard cities, those connecting links between the ancient and modern civilization, some remains of these Roman institutions, or recollections of them, probably contributed to revive the guilds, which naturally presented themselves as an excellent means of supporting the citizens against the nobility by uniting them into powerful bodies. It is certain that small societies existed as early as the 12th century, which appear, in the following century, to have been in the possession of important political privileges. When the advantages of these associations became known and felt they rapidly increased; and in the struggles of the citizens and the nobility the principal resistance against the latter was made by the corporations. As soon as the citizens acquired an influence on the administration the guilds became the basis of the municipal constitutions, and every one who wished to participate in the municipal government was obliged to become the member of a guild. Guilds in Germany possessed no political importance before the 13th century. At this time they acquired the right of bearing arms for the defense of their own interests, and when a struggle arose between them and the citizens belonging to ancient families the guilds were victorious, and became so powerful that even persons of “free occupations” joined these associations as the allodial possessors of land sometimes placed themselves under feudal lords. The by-laws of the German guilds contained regulations as to the training of apprentices, the practice of one's trade in different towns as a journeyman, and the requirements of a master. At an early period these workmen's associations met with opposition, but the opposition was not at first directed against them on account of the obstacles they threw in the way of commercial intercourse, and the other evil consequences of their monopoly, but simply on account of their political influence. In the 18th century several edicts were made in Germany against the abuses of the guilds, and at different dates in the 19th century freedom was granted in most of the states of Germany to all to practise any trade without being admitted into a guild. In Austria this was done in 1860, and

1. Guide-bird (Indicator sparrmanni).
2. Garden Warblers (Sylvia curruca and S. rufa).
3. Guinea Hens (Numida cristata and N. meleagris).
4. European Golden Oriole (Oriolus galbula).
5. Grakle (Eulabes religiosa).

in 1868 it was done for all the states of the North German Confederation.

In Great Britain the societies of mechanics were important principally in a political respect, on account of their connection with the democratic element of the constitution. These societies originated at the time of the development of the importance of the cities. In the towns where they long existed they had an important influence in the election of representatives, and in the municipal administration. These guilds, in England, had no legal right to prevent any man from exercising what trade he pleased. The only restriction on the exercise of trades was the statute of Elizabeth, requiring seven years' apprenticeship. The guilds of the city of London (among the oldest of which are the weavers, founded in 1164; the parish clerks, in 1232; the saddlers, in 1280; the fishmongers, in 1284; the goldsmiths, in 1327; the skinners, in 1327; and the grocers, in 1345) are still very important corporations, still continuing to fulfil the chief object for which they were founded — that of giving relief to poor and decayed members, and also having in many cases the management of vast funds bequeathed for benevolent purposes by persons who selected one or other of the guilds as trustees. Sometimes these funds are bequeathed for specific purposes, which the guilds, as trustees, are of course bound to carry out; but in other cases, where they are available for general purposes, the guilds have usually shown great discretion in the manner in which they have employed them. Besides the secular guilds or mechanics' associations there were from a very early period, in Great Britain, religious guilds, resembling the religious societies of modern times. From the time of Henry II. all such guilds were required to have a charter from the crown. In 1388 a return to these guilds was ordered to be made, and it was then found that that of Corpus Christi, York, numbered 14,800 members. Some of the most objectionable features of the ancient guilds have again been developed by some of the trades unions, their modern representatives.

In France guild-privileges were sold by the state from the 10th century till the revolution of 1789, and the position of the artisan had come to be a most pitiable one; but at that date every restriction on the exercise of any trade was removed. This was done also at a later period in Belgium, Holland, Italy, Sweden (1846), and Denmark (1862). An account of guilds in America will be found under LABOR UNIONS. See also TRADE UNIONS for the modern European history of guilds.

Guildhall, the usual designation in England for the mediæval city halls, the most famous of which is the London Guildhall, King Street Cheapside, first built in 1411, all but destroyed in the fire of 1666, and rebuilt in 1669. The façade dates from 1789. The great hall used for the famous city feasts, the election of city officers and members of Parliament, and for the public meetings of the livery and freemen, is 153 feet long, 48 feet broad, and 55 feet high. It is decorated by statues of various celebrities, and in the common council room there is a collection of valuable paintings.

Guilford, Conn., a town and borough of New Haven County, on Long Island Sound, and on the New York, N. H. & H. R.R., 14 miles east of New Haven. It was settled as Menunkatuck by English colonists in 1639, and one of the ancient stone buildings of that date is now used as a State museum. Farming, canning, iron working, and some woolen manufactures are the chief industries. Halleck the poet was a native and resident of Guilford. Pop. of town and borough (1900) 2,785; of town, 1,512.

Guilford (gĭl'fŏrd) **College,** N. C., a town of Guilford County, on a branch of the Southern R.R., six miles west of Greensboro. It was incorporated in 1895 and derives its name from Guilford College, a coeducational establishment controlled by the Friends, and founded in 1837. The income of the college is $20,000, and it has a library of over 6,000 volumes.

Guilford Court House, Battle of, 15 March 1781; in results one of the decisive battles of the Revolution. Cornwallis at Hillsboro proclaimed that he had conquered North Carolina, and called on the well-disposed to rally around him; Greene, awaiting reinforcements near the Virginia border, perceived the necessity of showing the patriots they were not abandoned, and advanced across the Dan. After some days of fencing and recruiting, Greene halted for battle at Guilford Court House. He had about 4,400 men, but 3,000 were militia; and of his Continental regulars, only the Virginians and the First Maryland were veterans, the Second being new. Cornwallis had 2,213 trained troops. Greene posted his first militia line in an open field, to thin the British front before giving way; the second in a wood 300 yards back; the regulars on a rise 400 yards to the rear, near the court-house. Their front was convex: the Virginians on the right, then in succession Singleton's artillery, Gunby and Howard's First Maryland, and Ford's Second Maryland on the left. Lee's Legion and Campbell's riflemen guarded the left flank; William Washington's cavalry, Lynch's rifles, and the remnant of the Delaware regiment, the right flank. The British routed the first militia after it fired one or two volleys; but only drove the second from the wood after an obstinate and murderous combat. Advancing against the hill, their left was riddled by a withering fire, and then broken by a bayonet charge of the First Maryland; but their right crushed the Second and captured two cannon. The First faced about and checked it; Washington in turn pierced the British line and retook the pieces. The First steadily crowded back their opponents with the bayonet; and Cornwallis only stayed the tide of defeat by ordering his artillery to open on the Marylanders through his own ranks, checking the pursuit at heavy loss to himself. Reforming, the British moved forward; and with double the number of real troops, carried the hill and held it against every assault. Toward evening Greene, after five hours' conflict, withdrew, leaving his artillery on the field because the horses were killed. The American loss was 79 killed and 184 wounded; and about 1,000 militia dispersed to their homes. Cornwallis lost 93 killed, 413 wounded, and 26 missing — 532 in all, or a quarter of his entire force. He announced a victory to Parliament, but Fox declared that "another such victory would destroy the British army"; and, in fact, Cornwallis had to fall back on Wilmington, abandoning his hold on the

Carolinas, except two or three places on the coast, and shortly going to Virginia and capture.

Guillaume, gwĭ-yōm', **Eugene,** French sculptor: b. Montbard, France, 4 July 1822; d. Rome, Italy, 28 Feb. 1905. He opened his first studio at Dijon, and subsequently became a pupil of Pradier at Paris. In 1845 he carried off the Grand Prix de Rome. It was during studies at Rome that he manifested that mastery of the human form which appears in his 'Reaper,' which he modeled at Rome. It was subsequently cast in bronze, and is now in the Luxembourg. In 1852 he produced in marble the sitting figure of Anacreon with the dove of Venus. He was, however, less successful in ideal creations than in portrait busts. His statues of Napoleon I. as lieutenant of artillery and as emperor, his bust portraits of Archbishop Darboy, of F. Baloz, Ferry, and Thiers are characteristic and dignified, but he is perhaps best known for his sculptures on the façade of the New Opera House, Paris (1869); 'The Fount of Poetry' (1873); 'Aopheus' (1878); 'Two Hermes'; 'Anacreon with Eros'; and 'Sappho with Eros and Andromache.' He was the designer of the medals given at the expositions of 1867 and 1878.

Guillemet, Jean Baptiste Antoine, zhŏṅ bäp-tēst äṅ-twän gwĭ-yĭ-mā, French painter: b. Chantilly 1842. After studying under Corot and Oudinot he exhibited for the first time in 1865. He chooses for his subjects the scenery of Normandy, and the Seine valley, and is faithful in his transcripts from nature, but his work lacks the color and subtility as well as the imagination of the Barbizon school. His 'View of Bercy' and 'View of Paris' are in the Luxembourg.

Guillotine, gĭl'ō-tēn, a machine for beheading, so called from Dr. Joseph Ignace Guillotin, and introduced during the French revolution. It consists of two posts united at the top by a cross beam, and furnished with grooves, in which a broad steel blade heavily weighted with lead descends by the impetus of its own weight on the neck of the criminal, fastened to a plank beneath. The certainty and speed with which this instrument separates the head from the body gives it an advantage over the axe or sword wielded by the hand. Machines of a similar description have been in use among many nations. In Italy, from the 13th century, it was the privilege of the nobility to suffer capital punishment by an instrument called the *mannaia,* closely resembling the guillotine. In Germany, likewise, during the Middle Ages, an instrument resembling the guillotine was made use of, though the blade did not fall upon but was thrust through the neck of the criminal. There was formerly employed in Great Britain, also, and more especially in Scotland, an instrument of decapitation called the "maiden," said to have been introduced by Regent Morton, who himself afterward suffered by it. It differed from the guillotine in this, that while the blade of the guillotine falls upon the neck of the criminal, in the maiden the blade is fixed with its edge upward, and the neck of the criminal is forced down upon it by the fall of a heavy weight. Such an apparatus was also known and used at an early period in France. The Dutch likewise formerly made use of a decapitating machine.

Dr. Guillotin was not the inventor of the instrument which bears his name, and had only a secondary share in its introduction into France. As a member of the constitutional assembly he proposed to that body to abolish all class distinctions in the method of inflicting capital punishments, and with that view to have some instrument invented which might do the work more quickly and certainly than the hand of the headsman. The establishment of a new penal code having now become the subject of deliberation, a vote for a uniform system of capital punishment was, on the motion of Dr. Guillotin, passed on 21 Dec. 1789, with a recommendation that the least painful method of inflicting it should be adopted. It was not till 1792, however, that this special machine was selected after a report from Dr. Ant. Louis, secretary to the College of Surgeons. The guillotine was first erected in the Place de Grève at Paris, and the first execution performed by it on 25 April 1792, on a highwayman. Shortly afterward, in remembrance of Guillotin's original proposition, it received the name of "guillotine," both popularly and in official language, and it was introduced wherever the penal code of France has been adopted.

Guimaras, gē-mä-räs', Philippines, an island lying west of Negros and south of Panay, forming with Panay the strait of Iloilo. The east coast is mountainous, the west coast, open and fertile; an excellent road follows the entire coast, except for a distance of 10 miles, and the most important towns are on this road. The products include rice, corn, cotton, and tobacco, and there are important fishing interests. The island is a part of the province of Panay.

Guimbal, gēm-bäl', Philippines, a pueblo of the province of Iloilo, island of Panay, situated on the southeast coast, at the mouth of a river, 17 miles west of the town of Iloilo. Pop. 10,950.

Guinaan, gē nä'an, a Malay tribe of the Philippines, inhabiting the watershed of the Rio Abra and the Rio Grande de Cagayan, island of Luzon, and the neighboring region of Isabela and Abra. They are a heathen, head-hunting tribe, and have a distinct language.

Guinea, gĭn'ē, an English gold coin, first issued in 1663; by a proclamation issued 22 Dec. 1717, the guinea was declared current at 21*s.* sterling. Its true value, as derived from the market values of gold and silver at that time was 20*s.* 8*d.*, about $4.96. It has not been coined since 1817, when the sovereign supplanted it, but the fashion still prevails of quoting prices of some things in guineas, and subscriptions are frequently recorded in the same denomination.

Guinea-corn, a name given to durra, *Sorghum vulgare,* cultivated in the United States under the name of broom-corn. See DURRA; BROOM-CORN.

Guinea-fowls, a family of gallinaceous birds (*Numididæ*) allied to the pheasants and turkeys, natives of Africa and Madagascar. Twenty-three species are known, the most familiar being the common guinea-fowl of our poultry yard (*Numida meleagris*). This bird ranges in a wild state from Senegambia to the Niger

River, and is found also on the Cape Verde Islands. It is supposed to have been first brought to Europe by Portuguese explorers in the 16th century; but these fowls were domesticated in Rome during the classic period. Of the other species the vulturine guinea-fowl (*Acryllium vulturinum*) is one of the handsomest, being striped with brilliant blue; while the black guinea (*Phasidus niger*) and the turkey-like guinea (*Agelastes meleagrides*) are peculiar in possessing spurs.

Guinea-grass, a kind of grass (*Panicum maximum*), often 6 or 10 feet in height, a native of western Africa, which has been naturalized in South America and the West Indies, and is largely cultivated for fodder.

Guinea, Gulf of, that portion of the Atlantic on the coast of Africa, between Capes Lopez and Palmas. Two of its arms are the bights of Benin and Biafra. The Niger flows into this gulf south of the bight of Benin. A number of small streams enter from French Kongo and Kamerun. It contains a number of islands, chief of which are St. Thomas, Fernando Po, and Prince's Island. The gulf has two currents, one setting eastward into the bights of Biafra and Benin, and the other coming from the south; they meet in the bight of Biafra, and unite in one stream which gradually expands as it flows northwest, then west and southwest.

Guinea-pig, or **Cavy,** a small, variable domesticated race of the restless cavy (see CAVY), bred in all parts of the world as a children's pet. It is about six inches long, and exists in several races, some short-haired, others with long, curiously ruffled hair. The colors are greatly varied, white, black and a mixture in quaint pattern of white and tan being preferred. It is a restless, grunting little creature, showing a small amount of intelligence, but gentle and amusing. It feeds on vegetables, bread, parsley, lettuce, etc., and is exceedingly cleanly in its habits. It begins to breed when five or six months old, the period of gestation being from 9 to 10 weeks, and the litters averaging from 4 to 5; and this extreme fecundity seems to be its only means of defence against extinction. The name is probably a corruption of "Guiana-pig," referring to its native home and its pig-like form and grunting. English children call them "cavies." They are bred by fanciers for show purposes, and clubs exist for the improvement of standard breeds.

Guinea-worm, a nematode worm (*Filaria medinensis*), the female of which may be three feet long, and as thick as a knitting-needle. It is a parasite in the feet and toes of residents of the East Indies and African coast, forming abscesses beneath the skin in which the worm is coiled up. It produces the disease known to the Greeks as dracontiasis, and one of those now called filariasis (q.v.). To extract the worm it must be slowly wound upon a roll of paper, a little at a time, care being taken not to break the worm, as if a portion is left in the abscess, the young will develop and be scattered under the skin. Although formerly confined to the Old World, the guinea-worm has recently been found in the tropics of America, but is very rarely seen in northern parts.

Guinevere, gwĭn'ĕ-vēr, the wife of King Arthur in the Arthurian legends (q.v.). In the first accounts of the Arthurian court, she plays a very unimportant part, and her character is not clearly portrayed. It is in the 13th century that the personality of the queen and the story of her love for Lancelot are first developed. The most vivid and powerful picture of Guinevere is that given by Tennyson in the 'Idylls of the King,' in which her sinful love for Lancelot is made the real cause of the downfall of the Round Table and Arthur's kingdom.

Guiney, Louise Imogen, American poet: b. Boston 7 Jan. 1861. She began to write for publication in 1880 and was a frequent contributor to 'The Pilot,' Boston. Her published works include 'Songs at the Start' (1884); 'The White Sail and Other Poems' (1887); 'A Roadside Harp' (1893); 'Martyr's Idyl and Shorter Poems' (1899); and in prose she has also published: 'Goose-Quill Papers' (1885); 'Brownies and Bogies'; 'Monsieur Henri' (1892); 'A Little English Gallery'; 'Lovers' Saint Ruths'; 'Patrins' (1897); 'The Secret of Fougereuse'; etc. She has edited an edition of Mangan's poems.

Guinness, SIR **Benjamin Lee,** Irish philanthropist: b. 1 Nov. 1798; d. 19 May 1868. He was a member of the great Dublin brewing firm, the largest in the world. In 1865–8 he was M. P. for Dublin. He restored St. Patrick's Cathedral, Dublin, at a cost of $700,000. His business in 1886 was placed in the control of a limited liability company, employing 3,000 persons and having a capital of £6,000,000.

Guinness, SIR **Edward Cecil,** Irish philanthropist: b. 10 Nov. 1847. He was the son of Sir B. L. Guinness (q.v.). In 1891 he became Baron Iveagh. He gave $1,250,000 for the purpose of erecting sanitary dwellings for working people at a low rent. Of this sum $1,000,000 was to be given to London, and the remainder to Dublin. The income obtained on the capital is to be employed in the same fashion.

Guinobatan, gē-nō-bä'tän, Philippines, a town in the province of Ambos Camarines, island of Luzon, on the Quinali River. Pop. 10,000.

Guise (gü-ēz or gēz) **Family, The,** French ducal house, a branch of the family of Lorraine. The founder was Claude, a younger son of René II., duke of Lorraine, who in 1506 became naturalized in France, and in 1513 married Antoinette de Bourbon, the daughter of the Count of Vendôme. In his favor the county of Guise (one of his numerous possessions in France) was erected in 1528 by Francis I. into a duchy. He died in 1550, leaving behind him five daughters (the oldest of whom, Marie, married James V. of Scotland, and was the mother of Mary, queen of Scots) and six sons — François, who succeeded him in the duchy of Guise and his other dignities; Charles (usually known as Cardinal of Lorraine), Louis (Cardinal of Guise), Claude, François, and René, all persons of note. The family acquired great political importance on the accession of Francis II., who was married to Mary, queen of Scots. François, the second duke of Guise, was assassinated in 1563, and left three sons, Henri who inherited his father's titles; Louis, cardinal of Lorraine and archbishop of Rheims (both put to death in 1588 on the command of Henry III.); and Charles, duke of Mayenne. Henri, third duke

of Guise, was succeeded by his son Charles, who died in Italy in 1640, and was succeeded by his second son Henri. Henri died without issue in 1664, when he left the title to his nephew, Louis Joseph, duke of Joyeuse and Angoulême. His son and succesor, François Joseph, died in 1671, leaving only one son, who died at the age of five in 1675, when the direct line of the house of Guise became extinct. In 1704 the title was revived for the house of Condé.

Guise, France, a town in the department of Aisne, on the Oise, 25 miles by rail northeast of St. Quentin. It is an ancient city, mentioned as early as 1050, and has interesting remains of the 16th century castle of the famous Dukes of Guise. The town is noted for the ironworks of Dequerème et Cie founded by Jean Baptiste André Godin, and conducted on a profit-sharing plan. The workmen are provided with dwellings on the associated plan; the first portion of the *familistère* was erected by Godin in 1859–60 at a cost of $400,000. In connection with the workman's colony is a *phalanstère,* or common dwelling-house accommodating 400 families, a theatre, library and reading-room, schools, nursery, covered playgrounds, and a co-operative store. Pop. (1901) 7,300.

Guitar', a stringed musical instrument, with an oval body, and a neck like that of the violin. The modern or Spanish guitar has six strings, the three highest of gut, the three lowest of silk covered with fine wire, and tuned to the E in the second space of the bass staff, A, its fourth, and the treble D, G, B, and E The intermediate intervals are produced by bringing the strings, by the pressure of the fingers of the left hand, into contact with the frets fixed on the key-board, while those of the right pluck or twitch the strings. The Spaniards are supposed to be the inventors of the guitar, and it is most widely used in Spain, though its use is quite general in other countries.

Guiteau, gē-tō', **Charles Julius,** American assassin: b. about 1840; d. Washington, D. C., 30 June 1882. He became a lawyer in Chicago, and in 1880, after the election of James A. Garfield to the presidency, went to Washington, presumably to secure the office of United States consul at Marseilles, but did not succeed. Owing to this and the fact that the new President was opposed to the Stalwarts, led by Roscoe Conkling, Guiteau became greatly incensed. On 2 July 1881, he shot the President in the waiting room of the Baltimore and Potomac Railroad station in Washington; and on 19 Sept. the President died from the effect of his wound. Letters taken from Guiteau after his arrest showed that he had planned to "remove" the President. He was indicted for murder on 7 October, was found guilty on 25 Jan. 1882 after a sensational trial in which insanity was the only plea offered for the defense, and was hanged in the District of Columbia jail, 30 June following. See GARFIELD, J. A.

Guiuan, gē'wän, Philippines, a pueblo of Sámar, on the extreme south coast, 78 miles southeast of Catbalogan, having a good harbor. On the edge of a reef near the town are several sulphur springs, which though covered by the sea at high tide, are never brackish. Pop. 11,300.

Guizot, François Pierre Guillaume, frän-swä pē-âr gē-yōm gē-zō, French historian and statesman: b. Nimes 4 Oct. 1787; d. Valricher near Paris, 13 Sept. 1874. His father, a lawyer, having in 1794 perished by the guillotine, his mother and her three sons retired to Geneva, where François was gratuitously educated at the gymnasium. In 1805 he commenced the study of law at Paris, but gradually drifted into the literary profession. In 1812 he married Mlle. de Meulan, editor of the 'Publiciste,' and became professor of history at the Sorbonne. On the fall of the empire he obtained several public offices, such as councillor of state, and director-general of the departmental and communal administration. In 1816 he published 'Du Gouvernement Représentatif et de l'Etat Actuel de la France,' and 'Essai sur l'Instruction Publique.' In 1820 the Duc de Berry was assassinated, and Guizot's party fell before an ultra-royalist reaction. In 1825 he lost his chair on account of the political character of his lectures, but regained it in 1828. In 1829 he again became councillor of state, and after the July revolution was appointed minister of the interior, but resigned in 1831. After the death of Périer, Guizot, along with Thiers and De Broglie, formed a coalition ministry, and rendered great service as minister of public instruction. He became ambassador at the British court in 1840, and next year was the real head of the government of which Soult was the nominal chief. He retained the office of minister of foreign affairs until 1848, and during that period opposed all measures of reform. After the fall of Louis Philippe, Guizot escaped, fled to England and though he returned the next year he henceforth practically retired from public life. Born of a Calvinist family, he always remained a stern Protestant of the orthodox type, although he zealously supported the temporal authority of the pope. Among his numerous works may be mentioned, 'Histoire de la Civilisation en France' (1830); 'Histoire générale de la Civilisation en Europe' (1828); 'Histoire de la Civilisation d'Angleterre' (1827); 'Washington'; 'Discours sur la Révolution d'Angleterre'; 'Méditations et Etudes Morales'; 'Guillaume le Conquérant'; 'Mémoires pour servir à l'Histoire de mon Temps' (1858–68); 'Méditations sur l' Etat Actuel de la Réligion Chrétienne' (1865); 'Mélanges Biographiques et Littéraires'; 'Histoire de France Racontée à mes Petits Enfants' (1870); etc.

Gujarat, gŭzh-rät', or **Guzerat, India, a** region bordering on the Arabian Sea, comprising part of the northern section of the presidency of Bombay and some native states. Area of the whole, about 70,000 square miles; pop. about 11,000,000.

Gulf of Saint Lawrence. See SAINT LAWRENCE, GULF OF.

Gulf-stream. See CURRENTS, MARINE.

Gulfport, Miss., city in Harrison County, on the Gulf of Mexico, and the Gulf & Ship Island and the Louisville and N. R.R.'s. Gulfport has grown in 5 years from a seacoast hamlet to a thriving city. The keynote of its success is the fact that it has one of the best harbors on the Gulf of Mexico. Prominent among its public buildings is the "Great Southern" hotel, with its 250 rooms, intended as a winter resort for Northerners and as a summer

resort for the people of the South, especially those of New Orleans. It is situated directly on the shore and is undoubtedly the finest resort hotel between Tampa and New Orleans. Other prominent buildings are the county courthouse and those of the First National bank and of the Gulf & Ship Island railroad. The latter is used for the offices of the company. The First National bank is now the largest bank in the State of Mississippi, having a capital of $250,000. The most important manufacturing plants are oil and fertilizer factories, the Gulfport Packing Company and the shops of the Gulf & Ship Island railroad. There are, also, numerous smaller concerns, such as iron foundries and wood-working plants. Pop. (1900) 1,020; (1903) 3,500.

Gulfweed, a genus (*Sargassum*) of seaweeds of the sub-order *Fucaceæ,* which grow in deep water along all warm coasts, and becoming easily detached, are found floating in immense quantities in the middle of all oceans, where they accumulate in vast eddies, as it were, of the oceanic currents. The North Atlantic species (*S. bacciferum*) is the best known, and takes its popular name from its presence in long yellow lines in the Gulf Stream; and its specific name from the berry-like appearance of its air-vessels. The frond is very long, and is furnished with distinct, stalked, nerved leaves, and simple axillary stalked air-vessels; and its structure approaches that of the higher plants. Where the Gulf Stream is deflected from the banks of Newfoundland eastward, and sends off its more southern branch toward the Azores, is situated the Sargasso Sea, "that great bank of weeds, which so vividly occupied the imagination of Christopher Columbus, and which Oviedo calls the seaweed meadows" (Humboldt). The quantity of floating seaweed is often such as to impede the progress of ships. Multitudes of small marine animals accompany it, with fishes ready to prey on them, constituting a distinct and considerable fauna. The gulfweed is eaten in China, and in other parts of the East also it is used in salads and as a pickle.

Gu'lick, John Thomas, American clergyman: b. Kauai, Hawaii, 13 March 1832. He was graduated at Williams College in 1856, studied theology at the Union Theological Seminary, went to China as a missionary, and subsequently to Japan. He is a well-known writer on topics relating to evolution and natural history. He contributed to the 'Journal' of the Linnæan Society of London: 'The Diversity of Evolution under One Set of External Conditions' (1872); 'Divergent Evolution Through Cumulative Segregation' (1887); 'Intensive Segregation' (1889); and other monographs.

Gulliver's Travels, a famous satire by Jonathan Swift anonymously published in 1727. It is one of the most brilliant and profound of satires, became immediately popular, and has never lost its interest for both young and old. It begins with Gulliver's account of himself and his setting forth upon the travels. A violent storm off Van Diemen's Land drives him, the one survivor, to Lilliput, where he is examined with curiosity by the tiny folk. His next voyage is to Brobdingnag, where he is a Lilliputian in comparison to the size of the gigantic inhabitants of this strange land, in which he becomes a court toy. The next adventure is a voyage to Laputa, where the inhabitants are absorbed in intellectual and scientific pursuits, and "taken up with intense speculations," and their conduct is most eccentric; this is probably a satire upon pedantry. The last voyage takes the traveler into the country of the Houyhnhnms, where the horses under this name have an ideal government,— Swift's Utopia,— and are immensely superior to the Yahoos, the embodiment of bestial mankind.

Gulls, a large group of sea-birds found throughout the world and constituting, together with the terns (q.v.), skimmers (q.v.), and skuas or jaeger-gulls, the family *Laridæ* (q.v.). Some 53 species of gulls are known, ranging in size from that of a pigeon to that of a goose. The prevailing color is pure white below and pearl gray above, while some species have a gray or blackish head, and a few are dull gray all over. The young birds of all species are dusky during the first year. They walk with tolerable ease, and swim well, but are incapable of diving. They keep much on the wing, and their flight is rapid, strong, and long sustained, even in heavy gales. In sitting they contract their necks and rest on one foot. They nest along the shores in the grass, on rocky cliffs or rarely in small trees, forming the nest of dry grass, sedges, etc., and invariably in colonies, creating a great uproar when their nesting-grounds are visited. The wild characteristic note is, in the bigger species, harsh and querulous, in the smaller a "laughing" or screaming; the lesser skuas give vent to a curious mewing cry and the great skuas to a similar but deeper sound. At the breeding-quarters the utterances are naturally more agitated and shrill, and the parents hang excitedly above a visitor's head. "The food," says Evans, "consists mainly of fish, mollusks, crustaceans, and worms, but is varied in the stronger forms by small mammals, young birds, and eggs; the great black-backed gull undoubtedly attacks lambs and weakly ewes; carrion is not uncommonly devoured; and *Larus maculipennis* acts as a scavenger at Buenos Ayres, besides clearing the country of grasshoppers, and robbing the Cayenne lapwing of its insect booty. Skuas give chase to their smaller kin, and force them to disgorge the fishes they have just caught, while even solan geese are sometimes victimized; *Larus scopulinus,* moreover, which robs the oyster-catcher of New Zealand, is a further instance of parasitic habits. Insects and their larvæ, turnips, berries, and grain are also eaten by these omnivorous but useful creatures."

Most gulls are migratory and scatter far along the coasts during fall and winter in search of food. On the eastern coast of the United States are five species. The large herring-gull (*Larus argentatus*) breeds on the coast of Maine and winters to the southward, being abundant about all harbors and along tidal rivers from October to April. Associated with them are sometimes seen the larger black-backed gull (*L. marinus*). In summer are present the smaller black-headed or laughing gull (*L. atricilla*) which nests plentifully on the salt marshes of the Middle and Southern States. The Bonaparte's and ring-billed gulls (*L. philadelphia* and *L. delawarensis*) breed on our northern coasts. In the interior Franklin's gull (*L. franklini*) inhabits the lake shores and marshes of

the upper Mississippi Valley; while on the Pacific coast occur several other species. In the arctic regions the most abundant gull is the great Burgomaster (*L. glaucus*), one of the largest species, which wanders some distance southward in winter. Two other species peculiar to the far north are the pure white ivory gull (*Pagophila alba*) and Ross's rosy gull (*Rhodostethia rosea*). The latter is one of the rarest of birds and one of the most beautiful, the whole under surface being suffused with pink and the neck surrounded by a dainty collar of gray. It has been seen in numbers only by the arctic explorers Murdoch and Nansen. The Kittiwake (*Rissa tridactyla*) is another species of circumpolar distribution, peculiar in lacking the hind toe. Several of these species are known on the coasts of Europe or Asia; and the gulls of other parts of the world present little that is peculiar. Large areas of coastal beaches and islands formerly inhabited by gulls in various parts of the world, but especially along the eastern coast of the United States, have been wholly depopulated of these beautiful and useful birds by the incessant robbery of their nests for the sake of the eggs — which are conical in form, and white or greenish, heavily blotched with purple and brown in color;— or for the sake of their plumage to be used in millinery trimmings. Protective laws now prevent this waste of life.

Consult Evans, 'Birds' (1900); Coues, 'Birds of the Northwest' (1874); Baird, Brewer and Ridgway, 'North American Water Birds' (1884).

Gum Arabic, a gum of the *Acacia arabica*, which grows in India and Arabia. Gum arabic can be obtained also from *Vachellia farnesiana* of India, a small tree closely allied to the true acacias. Gum arabic occurs in transparent white tears, which are often colored yellow or brown by impurities; it cracks on exposure to the air on the surface; it is brittle, and has a bland, mucilaginous taste. It dissolves in water, and the solution gives a precipitate of arabin on the addition of hydrochloric acid. Gum arabic contains about 70 per cent. of arabin, $2C_6H_{10}O_5+H_2O$, and 17 per cent of water; the rest consists of potash and lime, which are combined with the arabin.

Gum-boil, an abscess in the gum caused by inflammation, generally the result of toothache or of the presence of decayed teeth. The carious tooth or stump, if the inflammation proceeds from this cause, should be removed. When matter has formed it should be evacuated by a free incision, and the mouth should be frequently washed with tincture of myrrh and water. See DENTISTRY; TEETH.

Gum-resins are complex mixtures obtained from plants. They contain both a gum, which is soluble in water, and a resin, which dissolves in spirit. There are usually present in addition essential oil, coloring and extractive matter, and a variety of impurities. The gum-resins have frequently a strong and characteristic taste and smell. They are solid, opaque, and brittle. The common gum-resins are aloes, ammoniacum, asafœtida, euphorbium, galbanum, gamboge, myrrh, olibanum, opoponax, sagapenum, and scammony.

Gum-trees, a name for several different trees: (1) those of the Australasian genus Eucalyptus (q.v.); (2) in the United States, the pepperidge or tupelo, various species of which are called black, sour, cotton-gum, etc. (see TUPELO); (3) the liquid amber (q.v.).

Gumbinnen, goom-bĭn'nĕn, Prussia, the capital of a government with an area of 6,125 square miles. The town is on the Pissa, 22 miles by rail southwest of Edytkuhnen on the Russian frontier. It is comparatively modern, its municipal charter dating from 1722. There are manufactures of woolens and linens, and a trade in cattle and agricultural produce. Pop. (1903) 14,000.

Gumbo. See HIBISCUS; OKRA.

Gumma, gŭm'a, a tumorous deposit that occurs in the tertiary stage of syphilis (q.v.). It affects most frequently the bones, cartilages, skin, and periosteum. They are made up of a hard connective tissue which tends to undergo softening, causing destruction of the part and deep ulceration if near the surface. The periosteum of the cranial bones is particularly liable to be affected, causing dangerous pressure on the brain.

Gumming, or Gumosis. See DISEASES OF PLANTS.

Gums, various mucilaginous substances, generally obtainable from the sap of trees. They are soluble either in cold water or in alcohol. Many aromatic products such as are employed in making perfumes and incense are to be classed as gums. Gum Arabic is the best known among such products. It is obtained from the Senegal Acacia in Western Africa. There are no less than eight or nine varieties of this gum. Gum tragacanth comes from the *Astragalus gummifer*, in Western Asia. Cherry-tree gum, whose name tells its origin, is used for stiffening felt, as in hat making. There are some gums which might perhaps more properly be classed as resins, and are sometimes styled gum-resins; many of which are used in medicine.

Gun, a strongly-constructed metal tube, from which destructive projectiles are expelled by the gradually increasing pressure of gas, evolved from fired gunpowder or other explosive. The term comprehends every description of firearm, from cannons, mortars, and other heavy pieces of ordnance, to the fowling-piece, rifle, and pocket-pistol. See ARMS; ARTILLERY; FIRE-ARMS; ORDNANCE.

Gunboat, a term originally applied to small craft mounting usually a single gun, and employed exclusively in the defense of coasts and rivers. Experiences in the Crimean war suggested the extension of the use of gunboats to offensive warfare. One of the main objects of a ship of war being to carry guns, it was thought that a vessel large enough to carry only a single gun of the largest size would, from the rapidity with which it could be manœuvred, and its comparative immunity from shot, have great advantages in attack against large vessels carrying a heavy armament, and requiring much room and time to manœuvre. About 1860 the British government constructed about 200 gunboats upon this principle. They were about 100 feet long, with 22 feet beam, and a draught at load-line of 6½ feet. Each was armed with one deck-gun, a 68-pounder, which, by turning on a pivot, could

be used either ahead, astern, or in any other direction; while the facility of manœuvring was further enhanced by the rapidity with which the vessel itself could be turned almost in her own length. Experience soon proved that there were serious defects in this species of armament. One of these was, that from being obliged to carry their guns constantly on deck the gunboats were liable to be top-heavy and untrustworthy in a heavy sea.

A new gunboat was designed in England in 1868 by G. Rendel, the chief peculiarity of which was the placing of the gun on a platform, which could be raised to the deck or lowered to the hold by a donkey-engine. The gun did not turn on a pivot, the manœuvring being effected entirely by the turning of the vessel, to effect which it was fitted with twin-screws worked by independent engines. Other types of gunboat have since been constructed for the British navy. One of a recent and powerful type is 165 feet in length, with a breadth of 31 feet, and a displacement of 805 tons. It draws 11 feet 7½ inches of water, and has triple-expansion engines, working up to 1,200 horse-power, with a speed of 13 knots an hour. It carries six 4-inch steel breech-loading guns, besides two quick-firing guns and machine-guns, and is bark-rigged. A number of what are known as torpedo gunboats have been constructed for the British navy. One boat of this class is 200 feet in length, with a beam of 23 feet, and a depth of 13 feet. It is built entirely of steel, has a torpedo-tube through the bow and another through the stern in a fore-and-aft line, and one on each broadside forward, a 4-inch 25-cwt. central-pivot breech-loading gun, and six 3-pounder, quick-firing guns. It has two sets of triple-expansion engines, working up to 2,700 horse-power, and enabling the vessel of 450 tons to steam over 18 knots an hour. Several first-class gunboats of a more recent type are twin-screw vessels, 180 feet long, of 700 tons displacement, armed with two 4-inch guns and four 12-pounder quick-firing guns.

In the United States the gunboat figured to a very considerable extent in coast and lake warfare in our first two wars. They were first used on the Delaware River, in 1775–6, and drove the British frigate Reliance out of the roads. In December 1807 there were 69 of them in United States service, and the Congress ordered 188 more built, as an auxiliary to the embargo declared a few days later, making 257 in all. Improved ordnance has made them valueless, and they had a bad effect on the service, but there was strong opinion in their favor at the time, and they did good service in the War of 1812. The theory was that these movable batteries could act in water where large vessels could not, could be concentrated against the latter so as to afford as large an armament, yet present only a number of small targets, while their antagonist presented only one large one; that shots aimed too high would do no harm to gunboats, but would injure masts and rigging of frigates; that loss of rudder and sailing gear, the most crippling of accidents to a ship, could not happen to the gunboats, propelled and steered by sweeps; that nearness to the water level gave the guns more accurate aim; and that 75 gunboats could be built for the cost of one 36-gun frigate.

In 1903 the United States navy had 20 of the ordinary gunboats in commission and about 60 torpedo-boats and destroyers of the gunboat type. Great Britain in 1902 had 33 torpedo gunboats, Germany 3, and France 15. In most countries the gunboat has been superseded by modern torpedo-boats and destroyers.

Gun-carriage, or **Gun-mounting**. See Artillery; Fortification; Ordnance.

Guncotton is the name originally assigned to the material produced by Schoenbein, of Basle, Switzerland, in 1845 by treating cotton with a mixture of strong nitric and sulphuric acids. The discovery that starch, woody fibre, and similar substances give rise to the formation of highly combustible bodies when acted upon by concentrated nitric acid is attributed to Braconnot in 1832, and he styled the bodies so produced generically *xyloidine*. Six years later Pelouze took up this subject and extended his investigations to the behavior of cotton, paper and vegetable substances generally, and later Dumas prepared from paper by this means the substance which he called *nitramidine*. No practical result followed these observations until the discovery by Schoenbein of the advantages which followed the use of the acid mixture; a discovery which was also independently made by Boettger, of Frankfort, in 1847 and by Knop, of Hanover, and Taylor, of England, in 1847. The discovery aroused the liveliest expectations which were stimulated by the facts that the explosive was much more powerful than gunpowder and that when used as a propellant, it gave little or no smoke. Experiments and tests were begun shortly after with the new explosive in Germany, France, Austria, England, Russia, and the United States with a view of utilizing it as a substitute for gunpowder in guns. Unfortunately the material, as manufactured, was found to be not only so irregular in action that it was likely at any time to burst the piece, but also so unstable as to give rise to numerous accidents so that, especially after the serious and, at the time, inexplicable explosions at Vincennes and Bouchet in France, and Faversham in England, the experiments were discontinued except in Austria, where Baron von Lenk gave the matter close and long-continued study and came to the conclusion that the grave defects noted were not inherent in the material, but were due to the imperfect and irregular methods of manufacture, the failure to purify the cotton before treatment with the acid, and the failure to purify the guncotton and free it completely from acids after treatment. Following these convictions he improved the method of manufacture to such an extent that in 1862 the Austrian army had 30 batteries provided with guncotton cartridges made up by twisting the fibre into yarns which were braided together, but the spontaneous explosions at the magazine at Simmering in 1862 and at Steinfeld in 1865, together with the fact that the guncotton cartridges still gave at unexpected times abnormal pressures led to its further use in Austria being interdicted.

Von Lenk's process of manufacture was patented in England in 1862 and the Prentice Brothers began manufacturing under this process in 1864. In 1865 Abel patented an improvement of the process which was so successful in use that it gave guncotton a prominent and

permanent place among explosive substances, and this process is followed to-day. The cotton when treated with the acid is in the fibrous condition which so well characterizes it, and under the microscope these fibres are seen to be hollow so that each is really a capillary or hair-like tube. Von Lenk had shown that cotton contains not only cellulose as the main component of its structure but that there were smaller and variable quantities of other substances naturally present besides foreign bodies accidentally present, and that it was necessary to get the cellulose in a pure and dry condition before treating it with acid. He, too, with others, had proved that the purity, strength and proportions of the acids used and the time and temperature of immersion of the cotton in the acid mixture affected very materially the character of the substance produced, while it was essential that every trace of free acid should be removed from the product, since a most minute quantity of sulphuric acid acts continuously and cumulatively on the guncotton and causes a progressively increasing rate of decomposition. Yet von Lenk and all others up to this time produced the guncotton in the same long staple form as the cotton from which it was made. It was evident to Abel's mind that as the dry cotton was immersed in the acid mixture the capillary tubes, of which it was composed, would suck up the liquid acid and retain it with such force and in such a manner as to make its removal by wringing, or washing with or in water or by neutralization with alkalies, extremely difficult and uncertain, and to remedy this Abel proposed to pulp the guncotton through which the fibres would be cut into such short lengths that the acids could be completely and readily removed from the interiors of the tubes while furthermore this pulped material could by molding and pressure be shaped into any desired forms and dimensions.

Abel's process for the manufacture of military guncotton as carried out at the United States naval torpedo stations was as follows: The cotton used was what is known as «cop» or weaver's waste, which is the tangled clippings from the spinning room of a cotton mill; the thready form of this material being preferred to the fluffy form of the unworked cotton. This was first hand-picked to remove the larger foreign bodies present and to open out after baling. It was then boiled in 200-pound lots in caustic soda solution to remove grease, oils and the incrusting substances on the fibres, then wrung out in a centrifugal wringer and dried in a heated closet. It was then put through a cotton picker to open up the fibre and remove foreign bodies which had been overlooked in the hand-picking, and was then dried in a second closet at 225° F. until it contained not over one half per cent of moisture, when it was stored in small lots in hermetically sealed metal vessels to cool. It was then dipped in lots of one pound each in 150 pounds of acids, consisting of 1 part by weight of nitric acid, 1.5 specific gravity, to 3 parts by weight of sulphuric acid, 1.845 specific gravity, contained in a large iron trough about which cold water circulated so as to maintain a temperature of 70° F. throughout the dipping. The cotton was plunged rapidly under the acid, allowed to remain immersed for 10 minutes, removed to a shelf above the acid dipping trough, where it was squeezed to remove the excess of acid, and then at once transferred to a two-gallon crock made of acid-proof earthenware. As transferred to this digestion crock the cotton carried with it from 10 to 12 pounds of the acid mixture, and by pressing the mass down in the crock with an iron tool, the cotton was forced to the bottom and covered with a layer of the acid mixture which was squeezed from it. The crock was then covered and placed in a wooden trough where it was partly surrounded with cool water, which was kept in constant circulation, and where it was allowed to remain, so that the cotton could «digest» the acid, for 24 hours. Then the contents were thrown into a steel centrifugal wringer by which the greater part of the acid was removed. The guncotton was then thrown into a tub holding 800 gallons of water through which a large stream of water was continually flowing and in which a large paddle-wheel was in revolution so as to very quickly bring the acid guncotton into contact with so large a volume of cold water as to prevent its becoming heated. The guncotton was then boiled twice for eight hours each in a dilute solution of soda, wrung out and washed with fresh water and put in the pulper. This was an ordinary «beater,» «rag-engine,» or «Hollander,» such as is used in the paper-making industry, and the guncotton, suspended in water, was subjected to the action of the machine for two days in charges of from 300 to 350 pounds, where, by the shearing action of the knives, the fibres were cut into short lengths and the guncotton was reduced to the fineness of cornmeal, and mixed into a pulp with the water present. This was drawn into a large tank, known as the poacher, where the powdered guncotton was allowed to settle and the supernatant water drawn off. Fresh water was added and, by means of a revolving paddle in the poacher, the guncotton was mixed with it and washed by it, and this washing was repeated six or seven times until the chemical test of a sample showed that the acid had been completely removed. Then it was treated with a solution of lime containing a small quantity of caustic soda and also of precipitated chalk, and the mass was ready for molding.

As shown above the first use to which guncotton was put was as a propellent in guns, and Abel devised means for making powder grains from the pulped guncotton, but he soon pointed out the advantages which it possessed, when compressed, for use in military and naval mines and torpedoes and for engineering operations in times of war, and these are the chief uses to which it has been put. To compress it the alkaline solution from the poacher, containing the finely divided guncotton in suspension, was pumped up to a stuff-chest, which is a cylindrical tank containing a vertical shaft armed with paddle-blades which, by revolving, keeps the guncotton in suspension. From here, by means of a wagon, the pulp was run into a hydraulic press where it was subjected to a pressure of 100 pounds to the square inch and thereby molded into blocks. These blocks were then transferred to another press where they were subjected to a pressure of from 6,000 to 6,800 pounds to the square inch. As made at the United States naval torpedo stations the blocks from the molding press were prismatic, with the vertical edges chamfered, 2.8 inches in

diameter by $5\frac{1}{4}$ to $5\frac{1}{2}$ inches high, with a circular hole $\frac{1}{2}$ inch in diameter, produced by a mandrel in the press, running vertically through the centre of the prism. After final pressing the blocks were 2.9 inches in diameter by 2 inches high, the hole remaining practically unchanged, and they still contained from 12 to 16 per cent of water, though as sent out into the service as "wet guncotton" they were soaked in water until they contained 35 per cent. In the final press by means of steel dies, inscriptions in letters and figures, such as the place and date of manufacture and factory lot, were placed upon each block.

In the fibrous condition guncotton appears like the cotton from which it is made, but it has a harsher feel and it becomes electrified by friction when dry. When dry if rubbed in the dark it becomes phosphorescent. Under the microscope by polarized light it exhibits colors, while cotton is colorless. Pure guncotton is without odor or taste and is insoluble in water. The gravimetric density before pulping is 0.1, after pulping 0.3, and after compression from 1.0 to 1.3, but by excessive pressure it has been raised to 1.4. The real specific gravity of guncotton is 1.5. When dry, compressed guncotton is detonated by inserting a detonator in the hole in the block and firing it. Wet guncotton is detonated by the detonation of a block of dry guncotton fired in contact with it. The violence of the explosion of guncotton when thus detonated is comparable with, if not superior to, that of nitroglycerin. Dry guncotton may be set on fire and, when compressed, it burns so slowly in the open that the fire may be extinguished by pouring water upon it. Wet guncotton, thoroughly saturated with water, can be shaped by a tool without taking fire or exploding. In forming the cylindrical and conical charges for the torpedoes thrown from the pneumatic guns of the United States steamship Vesuvius at Santiago, the prismatic blocks above described were sawn with a band saw, turned in a lathe and cut with chisels as wood is treated, but care was used to keep the blocks and dust wet throughout the process.

Pure cotton is composed of cellulose having a formula which chemists believe to be some multiple of $C_6H_{10}O_5$. When it is acted upon by nitric acid or mixtures of nitric with sulphuric acid, under the proper conditions, cellulose nitrates are produced through, it is believed, the replacement of hydrogen atoms in the molecule by NO_2 groups, thus forming esters or organic salts. Views differ as to the number of cellulose nitrates existing but, following Vieille, who is the most widely accepted authority on this point, taking the formula of cellulose as $C_{24}H_{40}O_{20}$ we may have the following:

Cellulose Nitrates	Percent of Nitrogen	Weight obtained from 100 parts of Cellulose
Cellulose endecanitrate..	13.47	176.4
Cellulose decanitrate....	12.75	169.4
Cellulose enneanitrate...	11.96	162.5
Cellulose octonitrate....	11.11	155.7
Cellulose heptanitrate...	10.18	148.6
Cellulose hexanitrate....	9.15	141.7
Cellulose pentanitrate...	8.02	134.7
Cellulose tetranitrate....	6.76	127.8

There are probably existing also isomers of many of the nitrates given in the table. Following their differences in composition these different cellulose nitrates have different properties especially as regards their solubility in organic solvents. Thus all except the endecanitrate, if properly made, are soluble at ordinary temperatures in a mixture of one volume of alcohol and two volumes of ether. Such cellulose nitrates are called *pyroxyline*, *nitrocotton*, *soluble guncotton*, and *collodion*, *cotton* or *guncotton*. The decanitrate is also called *pyrocellulose*. All the cellulose nitrates are by some called *nitrocellulose*. The material produced by the Abel process described above is partly soluble, but mostly insoluble in the ether-alcohol mixture, and to this material the name *guncotton* or better *military guncotton* is applied. In addition to guncotton, the cellulose nitrates are used in the manufacture of smokeless powder, explosive gelatine, pyroxylin plastics, pyroxylin varnishes, photographic films and collodion. For smokeless powders and explosive gelatine the deca- and enneanitrates are most largely used. For varnishes, collodion and photographic films the octonitrate is generally employed. And the heptanitrate, which is of low nitration, is preferred for the pyroxylin plastics. This last nitrate may be made by dipping one pound of pure dry cotton or tissue paper in 100 pounds of a mixture of 66 parts of sulphuric acid, 17 parts of nitric acid and 17 parts of water, and continuing the immersion at 30° C. for 20 to 30 minutes. The acid is then wrung out and the nitrate washed and neutralized. The higher nitrates are made by using stronger acids, longer exposures and higher temperatures. In making pyroxyline varnishes, which are largely used in coating metals, artificial leather and in waterproofing, the pyroxylin is dissolved in ethyl acetate, amyl acetate and similar organic solvents.

Collodion, which is used in surgery, is made by placing 30 grams of pyroxylin in a suitable bottle, pouring upon it 750 cubic centimetres of ether, corking the bottle and allowing the whole to stand 15 minutes. Two hundred and fifty cubic centimetres of alcohol are then added and the bottle shaken until the pyroxylin is dissolved. On allowing to stand the solution becomes clear, and if poured upon a flesh wound the solvents evaporate and a continuous film of pyroxylin is formed which protects the wound from the air and which also, by contracting as it dries, brings the edges of the wound together. Substances such as cantharides, tannic acid and the like, by which to produce blistering, styptic and other effects, may be added to the collodion. See EXPLOSIVES. CHARLES E. MUNROE,

The Columbian University, Washington, D. C.

Gunnery is the science and art of using guns. As a science it treats primarily of the motion of projectiles, and has three branches, "interior ballistics," "exterior ballistics," and "effects of projectiles."

"Interior ballistics" considers motion within the gun, and seeks to determine the fluid pressure caused by the combustion of a given charge of powder and the velocities thereby imparted to the projectile and to the gun itself.

From the middle of the 14th century until some 20 years ago, a practically unchanged mixture of nitre, sulphur, and charcoal, called gun-

powder, was universally used as the propelling agent in firearms. At first, as the name implies, it was used in the form of dust; later the superior effects produced by granulation were discovered, and a powder in the form of small irregular grains was used in all kinds of guns; early in the 19th century powders were divided into two classes, the finer-grained "musket powder" being used in all shoulder pieces, and the coarser "cannon powder" in all artillery; about 1860 Gen. Rodman, U. S. A., proposed and developed the manufacture of powders of regular granulation and very large grains for use in the 15- and 20-inch smooth-bore guns; with the advent of large rifled cannon, the practice became general of molding powder into separate grains of a size and density suited to the particular gun in which it was to be fired; a slower burning gunpowder, called brown, or cocoa, powder from its color, and made from underburned charcoal, next came into use for large guns; and, finally, the discovery that the high explosives can, by suitable treatment, be made to burn progressively in guns made smokeless powders practicable, and these have now entirely superseded gunpowder.

The explosion of the powder charge of a gun begins with "ignition," which is the setting on fire of a portion of it; "inflammation," or the spreading of the fire from grain to grain, throughout the charge, follows; and "combustion," or the burning of each grain from surface to centre, completes the phenomenon. Meanwhile the gaseous products of the combustion, filling the powder chamber, develop a fluid pressure which starts the projectile from its seat and gives it an accelerated motion along the bore. Evidently the gas pressure at any instant depends upon the quantity of powder consumed at that instant and the space which the products of its combustion occupy, and the latter depends not alone upon the volume of the powder chamber, but also upon the displacement of the projectile. It might well be thought that the periods of time required for the inflammation and combustion of a charge of gunpowder are so small as to be negligible, yet much of the superiority of modern over ancient ordnance comes from proper regulation of those time intervals. The ballistic power of granulated was much greater than that of dust powders because the interstitial spaces between the grains greatly increased the rapidity of inflammation, and the use of large charges of grained powders without inadmissible strains upon guns was made possible only by so diminishing the rapidity of combustion that the burning of the powder was not complete till the projectile had traversed a considerable portion of the bore of the gun. Robins, Hutton, and Count Rumford were the pioneers in the experimental determination of the force of fired gunpowder and in measuring, by means of the former's "ballistic pendulum," the velocities which it imparted to projectiles, but Rodman was the first to directly measure the pressures developed in guns by the explosion of their charges. In 1861 he published the results of experiments made for the United States government, and described his pressure gauge, a modification of which is still universally used for measuring powder pressures. The Rodman gauge consists of a piston contained in a small cylinder inserted in the gun wall so that the inner end of the piston is exposed to the bore of the gun, while its outer end, which carries a knife edge, presses against a disk of soft copper: on firing the gun the gas pressure forces the piston outward and the knife edge makes a cut in the copper which, by comparison with cuts made by known forces, measures the gas pressure which produced it. Rodman measured the pressures in guns not only at the bottom of the bore, but at intervals to the muzzle, thereby determining the necessary thickness of metal to withstand them, and he showed that by making the size of the powder grains vary with the size of guns, their ballistic power could be increased without increase of strain upon their walls.

The first exhaustive investigations of the phenomena attending the explosion of gunpowder were those of Noble and Abel, communicated to the Royal Society in 1874 and 1879. They measured velocities with the electric chronograph, and powder pressures with the Noble "crusher" gauge, which differs from the Rodman gauge in using the extent to which a copper disk is shortened by crushing, instead of the dimensions of a cut, to measure the force. They found that the products of explosion consisted of 57 per cent by weight of solid or liquid matter and of 43 per cent by weight of permanent gases; that the gases, reduced to 32° F. and atmospheric pressure, would occupy about 280 times the volume of the original powder; that the pressure produced if the powder filled the space in which it was exploded was about 43 tons per square inch; and that the temperature of combustion was about 4000° F. They also deduced formulæ for the pressure at any point in the bore of a gun and for the work per pound of powder which its charge would do, both based on the assumption that the solid and liquid residue gave up its heat to the gases during their expansion; and these formulæ were very generally used until gunpowder was replaced by smokeless powders, it being only necessary to apply to the calculated work of any powder charge a "factor of effect" based upon experience in order to predict with reasonable accuracy the muzzle energy of the projectile and thence to deduce its velocity. By far the most important and complete study of the questions of interior ballistics has been made by the engineers of the French "Service des Poudres et Salpêtres" during the past 20 years, and it is to their experimental investigations that we owe almost all of the latest knowledge upon this subject. Sarau was the first to take into account the progressive combustion of the powder charge under the varying pressure in a gun, and by assuming that the velocity of combustion is proportional to the square root of the pressure he deduced his now classic formulæ for the muzzle velocity and maximum pressure resulting from firing a given gun with any given charge of a powder of previously established characteristics. He, like all previous investigators, assumed that the powder grains burned progressively from the surface in parallel layers, but Vieille, by registering the movement of the piston of a crusher gauge while it was compressing a copper disk under the action of powder pressure, measured the rate at which the pressure was developed and, having thus determined the law of combustion of various explosives, proved that progressive burning from the surface was a

characteristic only of the modern smokeless powders and did not occur in the case of the older black and brown gunpowders in the forms in which they were actually used in guns. Vieille found that the velocity of combustion of pure guncotton smokeless powders was proportional to the two thirds power of the pressure, varying from about 1.4 inches per second under a pressure of two tons per square inch to about six inches per second under 20 tons per square inch; while in the case of smokeless powders containing from 40 per cent to 50 per cent of nitroglycerine, such as cordite and ballistite, the velocity of combustion was about three times greater and varied about as the five ninths power of the pressure. He also established the fact that the pressure caused by the combustion of any explosive in a closed chamber is accurately given by the expression $p=\frac{f\ \Delta}{1-a\ \Delta}$ in which Δ is the "density of loading" or the ratio of the weight of the explosive to the weight of water which would fill the chamber; f is the "force" of the explosive, varying from about 22 tons per square inch for gunpowder, to as much as 67 tons per square inch for some smokeless powders; and a is the "covolume" of the explosive, having a value from 0.5 to 0.6 for gunpowders and not differing greatly from unity in the case of high explosives and smokeless powders.

Notwithstanding his somewhat erroneous assumptions, Sarau's formulæ gave very accurate results for gunpowder, and when put in the slightly modified form which follows they are still the most reliable for use with smokeless powders. As originally used, Sarau's formulæ contained factors depending upon the form of the powder grain and its time of combustion in free air; but with smokeless powders these may be displaced by a single factor, namely, the "least dimension" of the grain, since with true progressive burning it is this, which, for any given powder, fixes its time of combustion.

These formulæ, as modified, are

$$V=A\frac{w^{5/8}\ u^{3/8}}{e^{1/2}\ p^{1/4}\ c^{1/4}\ s^{1/4}}\left(1-B\frac{p^{1/2}\ u^{1/2}}{e\ c}\right) \text{ and } P=K\frac{w^{7/4}\ p^{1/4}}{e\ c^{2}\ s},$$

in which V is muzzle velocity of projectile in feet per second.

u is travel of projectile in the bore, and c is the calibre, in inches.

p is weight of projectile, and w that of powder charge, in pounds.

s is volume of powder chamber, in cubic inches.

e is the least dimension of the powder grain, in inches.

P is maximum pressure in gun, in pounds per square inch.

A, B, and K are constants, having the following values as determined by experiment for the guncotton smokeless powder used in the United States:

$A=373.68$; $B=.00035133$; $K=98555$.

The following practical formulæ give approximately the changes in muzzle velocity and maximum pressure (dV and dP) due to small changes in the weight of projectile or of powder charge (dp and dw).

$$\frac{dV}{V}=-0.43\frac{dp}{p};\ \frac{dP}{P}=0.3\frac{dp}{p};\ \frac{dV}{V}=\frac{5dw}{8w};\ \frac{dP}{P}=\frac{7dw}{4w}.$$

Similarly, the change in muzzle velocity, due to a change in the length of bore, is $\frac{dV}{V}=k\frac{du}{u}$ where k has a mean value of about five sixteenths, varying from three eighths for slow to one fourth for quick powders.

Among modern practical ballistic instruments are Sébert's "projectile register" and "velocimeter." The former directly measures the acceleration of a projectile during the first part of its motion in the gun, and thus determines the pressure on its base; but the difficulty of stopping the projectile in a butt without injuring the recording apparatus contained in it has prevented the extensive use of this device. The velocimeter is an apparatus for the simultaneous registering of the time and the distance moved by a gun in free recoil, whence the pressure on the bottom of the bore is calculated.

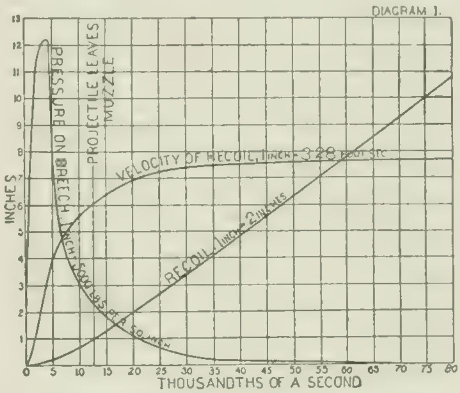

Diagram 1 gives the information obtained by means of the velocimeter from the firing of a United States army 8″ rifle. The projectile weighed 300 pounds; the charge was 52 pounds of a guncotton nitroglycerine smokeless powder; and the total recoiling weight was 34,573 pounds. The maximum pressure of 61,500 pounds per square inch was attained in .0045 seconds from the beginning of motion, and at that time the gun had moved 0.26 inches to the rear, and acquired a velocity of 10.76 f.s.; while the projectile had moved 27.54 inches and acquired a velocity of 1,140 f.s. The projectile left the muzzle in .013 seconds with a velocity of 2,072 f.s., having traveled 204.87 inches;

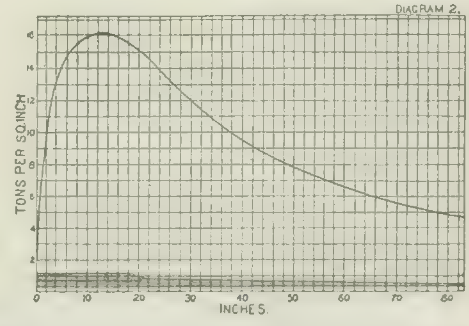


while at the same instant the gun had moved 1.9 inches and had a velocity of 19.78 f.s., and

the pressure had fallen to about 11,000 pounds per square inch. Spring gauges, capable of giving a continuous record of the varying pressures in a gun and registering them as the gun recoils, have also been successfully used in recent years, and diagram 2 gives the information obtained by such means from the firing of a French 10 c.m. (3.97 inches) gun. The projectile weighed 31 pounds, and the charge was 4.4 pounds of French guncotton smokeless powder. The maximum pressure of 18.6 tons per square inch was developed when the gun had moved 0.14 inches in free recoil, and the projectile 12.0 inches; when the projectile left the muzzle the gun had recoiled 0.95 inches and the pressure had fallen to about 5.3 tons per square inch.

It will be seen from diagram 1 that the velocity of recoil increases from about 20 f.s. to 25 f.s. after the projectile has left the muzzle. This is due to the reaction of the escaping powder gases. If u and W are the maximum velocity of free recoil and the total recoiling weight, p and w being the projectile and powder-charge weights, and v the muzzle velocity, then $Wu = vp + nvw$, where nv is the mean velocity of exit of the powder gases. With gunpowders n has a value of about three halves, but with smokeless powders it is probably somewhat larger.

The energy of rotation of the projectiles of modern guns is about 2 per cent of their energy of translation, and is allowed for in ballistic calculations by a suitable increase of the assumed value of the weight of the projectile. About 1 per cent of the available energy developed by the discharge is absorbed in the recoil of the gun: from 10 per cent to 12 per cent is taken up in giving energy of translation to the powder charge itself; and about 5 per cent goes to heat the gun walls.

Exterior Ballistics treats of the motion of projectiles after they have left the gun, and investigates the laws which govern their flight in air. The ancient artillerists supposed that the trajectory was composed of three distinct parts, of which the first, or "violent" part, was a straight line, the middle a circle, and the last, or "natural" part, again straight. Nicholas Tartaglia, who may well be called the father of ballistics, invented the quadrant for measuring a gun's angle of elevation, and in 1537 published a treatise on the flight of projectiles, in which he showed that no part of a trajectory is straight, and that the range increases with the angle of elevation up to 45°, where it is greatest. Galileo, who also neglected the resistance of the air, showed that the path of a projectile is a parabola with vertical axis. Newton, assuming that the resistance of the air is proportional to the square of a projectile's velocity, demonstrated that the trajectory consisted of two dissimilar branches, one ascending and the other descending, and that the latter would become vertical if sufficiently prolonged. Robins was the first to measure experimentally with any degree of accuracy the velocity of projectiles. In 1742 he published his famous 'New Principles of Gunnery,' and described his invention, the "ballistic pendulum," which consisted of a heavy bob suspended from a tripod and arranged to receive the impact of a projectile and to register the resulting swing: the velocity imparted to the bob by the impact could then be calculated, and thence, by the principle of the equality of the quantities of motion before and after the impact, the striking velocity of the projectile could be determined. Robins measured velocities as high as 1,700 f.s., and determined approximately the loss of velocity due to air resistance for distances up to 250 feet from the gun; he also suggested using the gun itself as a pendulum and calculating the velocity of the projectile by observing the swing of the gun when it was fired, and Count Rumford soon afterward experimented with this device. Dr. Hutton made extended experiments in England from 1775 to 1791 with both the ballistic pendulum and the gun pendulum, but there was no further great advance in knowledge of ballistics until the French government experiments were made at Metz in 1839 and 1840, from the results of which it became possible to roughly construct trajectories and to calculate, by empirical formulæ, approximate ranges and times of flight for any given elevation of a gun. In 1840 Wheatstone suggested measuring the velocity of a projectile by causing it to cut successive wire screens, each of which formed part of an electric circuit, and in following years many instruments for measuring projectile velocities by electricity were perfected, of which the Boulengé chronograph is to-day the most widely used. This instrument consists of two electro-magnets, the magnetizing currents of which pass through wire screens at a carefully measured distance apart in the path of the projectile, and from one of which is suspended a long cylindrical rod, called the chronometer, while from the other is suspended a shorter rod, called the registrar. A spring trigger carrying a knife edge is so arranged that when the registrar drops it strikes and releases it, causing it to fly forward and make a cut on the side of the chronometer. When released by hand the trigger makes a mark on the suspended chronometer called the origin: when the circuits are simultaneously broken by a device called the disjunctor the chronometer and registrar fall freely side by side until the released trigger makes a second mark on the chronometer at a distance above the origin called the disjunctor reading: when a projectile is fired it cuts the first screen, releasing the chronometer, then it cuts the second screen, releasing the registrar, and thus a mark is made whose distance above the origin is the velocity reading: then the time of falling freely the velocity reading less the time of falling freely the disjunctor reading is the time it took the projectile to travel from the first to the second screen, and the distance between the screens divided by this time is taken to be the velocity of the projectile when midway.

The perfection of a means of accurately measuring the velocity of a projectile at any desired point in its path made it practicable to experimentally investigate the laws governing the resistance of the air. Bashforth, in extensive experiments (1865–70 and 1878–80), showed that the resistance was proportional to the square of the projectile's diameter, and for flat, hemispherical, and ogival-shaped heads, varied in ratios about as 1.5, 1.0, and .80; his earlier experiments, however, were vitiated by his use of studded projectiles having insufficient rotation for smooth flight. Mayevski's deductions, published in 1883, and founded upon Krupp's ex-

periments, are probably the most reliable. Expressing the retardation ($\frac{dv}{dt}$) in the form $A\frac{d^2}{w}v^n$, in which d is diameter in inches, and w is weight in pounds of the projectile, v is its velocity, and $\frac{dv}{dt}$ its retardation in f.s.s., he found the following values for A and n:

v between 2800 f. s. and 1375 f. s.;	$n=2$;	log $A=$	6.119244(-10)
v " 1375 " " 1230 ";	$n=3$;	"	2.980883(-10)
v " 1230 " " 970 ";	$n=5$;	"	6.801844(-20)
v " 970 " " 790 ";	$n=3$;	"	2.773423(-10)
v " 790 " " 0 ";	$n=2$;	"	5.669876(-10)

These values of the consonants n and A are for projectiles having ogival heads of two calibres radius, and for a standard condition of the atmosphere. For other conditions the retardation found as above must be multiplied by a coefficient of form (i), and by the ratio of the actual density of the air to its assumed standard density ($\delta=\frac{\Delta 1}{\Delta 0}$). Thus we have for a general formula $\frac{dv}{dt}=i\,\delta\,A\frac{d^2}{w}v^n$, in which i depends upon the form of the projectile, and is unity for most modern projectiles, and δ depends upon the temperature, barometric height and humidity, and is unity for ordinary atmospheric conditions.

Since the retardation is inversely proportional to $\frac{w}{i\,d^2}$, that factor, which is called the "ballistic coefficient" and denoted by C, measures the "ranging power" of a projectile. With spherical projectiles C could only be increased by increasing the calibre, but with rifled guns it became possible to greatly increase its value for any calibre of gun by lengthening the projectile and sharpening its point, and it is this fact which largely accounts for the immense superiority in ballistic power of rifled over smooth-bore guns.

Assuming that the axis of a projectile coincides with the tangent to its path, as is practically the case with modern rifled guns, the resultant action of the resistance of the air will likewise coincide with the axis, and the trajectory will be the same as if the mass of the projectile were concentrated at its centre of gravity and moved under the action of two forces, one the constant vertical force of gravity w, and the other the variable resistance $\frac{w}{g}\frac{dv}{dt}=A\frac{i\,\delta\,d^2}{g}v^n$ acting in the tangent. Under these circumstances the differential equation to the trajectory is readily obtained, and, though its form prevents direct integration, its approximate solution has been effected by several different methods, of which Siacci's is the simplest and the one almost universally used. By Siacci's method the two co-ordinates, the inclination, the time, and the velocity at any point of the trajectory are given as functions of a new variable, called the pseudo-velocity, and, by means of tabulated values of those functions all the problems of exterior ballistics may be accurately solved.

As shown by Mayevski's formulæ, we may consider the air resistance to be proportional to the square of the velocity, so long as the velocity exceeds 1,375 f.s., which is the case throughout the trajectories of modern naval and coast defense guns (excepting mortars), when they are fired at the moderate elevations with which alone they are practically used. Within these limits the equation to the trajectory in air, the gun being the origin, is $y=x\tan\alpha-\frac{g\,x^2}{2V^2\cos^2\alpha}(1+\frac{2kx}{3})$, the first two terms of which represent the trajectory in vacuo, and in which α is the angle of departure of the projectile, V is its initial velocity, and k is the constant in the expression for the retardation $\frac{dv}{dt}=kv^2$. Thus, for example, taking the case of a 12″ projectile of standard form, 880 pounds weight, and 2,800 f.s. initial velocity, we have, under standard atmospheric conditions, $k=A\frac{d^2}{w}=\frac{d^2}{w}$ (6.119244 —10) = .000021534, and, supposing we wish to determine the proper angle of elevation for a range of 3,000 feet, putting $y=0$, we get $\sin 2\alpha=\frac{g\,X}{V^2}(1+\frac{2kX}{3})=0.0128$; whence $\alpha=22'$. By the same formula the elevation for a range of 15,000 feet will be found to be 2°—09′, which agrees with the published range table for the latest pattern United States naval 12-inch gun.

Representing the ratio of the range of any projectile in vacuo (P) to its range in air (X) by n, so that n is the $1+\frac{2k}{3}X$ of the preceding formula, it can be shown that n, while always greater than unity, cannot exceed 3, and that for flat trajectories the following relations are quite approximately true: the angle of fall (ω), which in vacuo equals the angle of projection (α), in air is given by $\tan\omega=(2-\frac{1}{n})\tan\alpha$; the abscissa of the highest point (X_1), which in vacuo is half the range (X), in air is given by $X_1=X\frac{\sqrt{3n^2-3n+1}-1}{3(n-1)}$ and cannot exceed $0.57X$: the time of flight (T), which in vacuo would be $T_1=\frac{X}{V\cos\alpha}$ or very closely $\frac{X}{V}$, in air is given by $T=\frac{2.(3n-2)^{\frac{3}{2}}-1}{9\quad n-1}.\frac{X}{V}$, or still more roughly by $T=n\frac{X}{V}$, and cannot exceed $1.95T_1$: the striking velocity (U), which in vacuo would be the same as the initial velocity V, in air is given by $U=\frac{V}{\sqrt{3n-2}}$ and cannot be less than $0.38V$.

Experience shows that the projectiles of rifled guns, when fired in a still atmosphere, deviate from the plane of fire (a vertical plane through the axis of the gun) to an extent approximately proportional to the square of the time of flight and in the direction toward which the upper surface of the projectile moves in its rotation. This deviation is called "drift." and fer all United States guns is to the right, since they are so

rifled that their projectiles, viewed from the rear, turn with the hands of a watch. With modern high-velocity guns drift is only important at very long ranges, being, for example, in the case of the 12-inch rifle already cited about 1½ yards at 2,000 yards range, and about 100 yards at 12,000 yards range. The cause of drift is that soon after the projectile leaves the gun the line of action of the air resistance ceases to coincide with the axis (on account of the curvature of the trajectory), and, meeting that axis obliquely between the point of the projectile and its centre of gravity, tends to raise the point, which action, combined with that of rotation, causes the point to move first to one side (the right for right-handed rotation), and then downward: this movement, by virtue of which the axis of the projectile tends to describe a cone about the tangent to the trajectory, is called precession, and its result, in combination with the angular motion of the tangent caused by the curvature of the trajectory, is to keep the point of the projectile always on that side of the plane of fire toward which it was first deflected. Thus with right-handed rifling the projectile, during its flight, always points very slightly to the right of the plane of fire, and consequently the resistance of the air has a component normal to that plane which carries the projectile bodily to the right with increasing velocity.

For many reasons, among others the fact that the drift caused by rotation is affected by lateral wind pressure, it is difficult to determine accurately the deviation of a projectile which will result from a side wind. Hélie's formula, $D = W\left(T - \frac{X}{V \cos \alpha}\right)$ in which W is the velocity component of the wind at right angles to the line of fire, T is the actual time of flight, and $\frac{X}{V \cos \alpha}$ is the time the projectile would take to traverse the range (X) if its original horizontal velocity ($V \cos \alpha$) remained unchanged, is usually relied upon; but, while reasonably accurate for light projectiles, it gives much too great results for modern projectiles of large calibre, especially at moderate ranges. Assuming that in the short time of flight the projectile can acquire but little lateral velocity, the wind effect is a practically constant lateral pressure, and the deviation caused by it will be $D = k \frac{W^2 T^2}{d}$ in which, d being the diameter of the projectile, W the wind velocity at right angles to the plane of fire, T the time of flight, and D the deviation, k will be a consonant whose value must be found by experiment. The increase or decrease in the range caused by the wind is approximately $\Delta X = 2 W T \left(\frac{VT}{X} - 1\right)$, in which W is the velocity component of the wind in the plane of fire.

The Effects of Projectiles depend not only upon their own characteristics, but also upon the nature of the objects attacked. "Cannister," the balls of which spread on leaving the gun and rapidly lose their velocity, are only effective at ranges within 300 or 400 yards and against exposed men or very light vessels, such as torpedo boats. The "shrapnel," burst by the action of a time fuse, produces a cone of balls and fragments whose axis is the trajectory and whose angle of dispersion depends upon the violence of the explosion, and can be used effectively against exposed men at any range, provided the point of burst can be properly adjusted: with field artillery, which uses shrapnel almost exclusively, it is usual to adjust the fuses with a view to causing the burst to occur when the height of the shrapnel above the point of attack is about one two hundredth of its distance from the gun. "Common shell" are sometimes used like shrapnel, but as a rule they are fitted with percussion fuses to cause them to explode on impact, in which case they are effective against unarmored ships and fortifications, and against any structures not protected by armor sufficiently thick to cause them to break up without penetration. If made of steel, and with thick walls, a common shell may be capable of penetrating steel plating of a thickness equal to half its own calibre, but as a rule the shell walls are thin and the power of penetration much less than this. It requires a resistance at least equal to that of a quarter-inch steel plate to actuate the fuse of a 6″ shell, and after penetrating such a plate it will range 10 or 15 feet before bursting. The larger the shell the more the resistance required to burst it, and the farther it travels after impact before bursting. From the point of burst the fragments spread in a cone, the angle of dispersion depending upon the relation between the velocity of the shell as a whole at the instant of bursting and the velocity imparted to the fragments by the explosion. The greater destructive effect of shell loaded with high explosives than of those loaded with gunpowder is primarily due to the much wider angle of dispersion of the former. "Armor-piercing shell" have been so perfected as to be capable of penetrating, unbroken and undistorted, a thickness of wrought iron or steel only limited by their striking energies. Against hard-faced armor, however, these projectiles require the aid of soft steel caps in order to penetrate even a moderate thickness without being shattered. The formulæ of Jacob de Marre, based upon French experiments, are considered the most reliable for calculating the velocity necessary for the perforation of oak, wrought iron, or homogeneous steel by projectiles of the usual form and of such quality as not to be broken or seriously distorted by the impact. When a projectile is distorted, or is broken, by impact, the velocity necessary for perforation increases very rapidly with the amount of distortion, or the number of fragments.

These formulæ are as follows:

For oak $v = \frac{e^{.6}\, a^{.9}}{p^{.5}}$ (log 2.20987)

For wrought iron $v = \frac{e^{.65}\, a^{.75}}{p^{.5}}$ (log 2.96162)

For steel $v = \frac{e^{.7}\, a^{.75}}{p^{.5}}$ (log 3.00941)

In which e is the thickness to be perforated and a the diameter of the projectile, both in inches; p is weight of the projectile, in pounds; and v is its striking velocity in feet per second.

For capped projectiles and Harveyized armor, the Davis formula, based upon experiments at the United States naval proving ground, is $v = \frac{e^{.8}\, a^{.5}}{p^{.5}}$ (log 3.25312), and the same formula will serve as well as any yet proposed for Krupp armor, if to the calculated velocity be added from 50 to 100 f.s., the amount added increasing with the thickness of the plate.

The above formulæ are all for normal impact. When the angle which the axis of the projectile makes with a normal to the plate is less than 30°, provided the projectile remains whole, and if its velocity component normal to the plate exceeds the velocity required for perforation with normal impact, it will perforate the plate: with greater angles of incidence than 30° the projectile is deflected unless it very greatly overmatches the plate.

Experiments show that a projectile which will penetrate a distance unity into oak will penetrate slightly less than one half into concrete, about one half into good masonry, about three halves into sand, about four into common earth, and about seven into clay.

The Art of Gunnery is concerned with the actual use of guns, and primarily with pointing them so that when fired their projectiles shall hit the target. If a great number of rounds be fired from a gun under as nearly as practicable the same conditions, and the impacts are received upon a vertical screen, the average of their distances above or below the mean point of impact is called the mean vertical error of the gun; their average distance to right or left of the mean point of impact is called the mean horizontal error; and the trajectory from gun to mean point of impact is called the mean trajectory. Theory, as well as practical experience, indicates that only about 2 per cent of the projectiles fired will deviate from the centre of impact more than three times the mean error, and with modern guns the mean errors are so small that we may reasonably expect practically all the shots fired on any occasion, from a stationary platform, and at a fixed angle of elevation, to strike within a vertical rectangle 9 feet high by 6 feet wide at a distance of 2,000 yards. It is only necessary, therefore, to point a gun so that its mean trajectory intersects the target at the latter's centre in order to obtain a large percentage of hits: the accomplishment of this, however, is not easy and constitutes the principal part of the gunner's art. Guns are pointed by directing what is called the "line of sight" at the target. Originally the upper surface of the gun itself was used as the line of sight: this was called "sighting by the line of metal," and resulted in the gun having an elevation corresponding to the difference in thickness of the metal at breech and at muzzle, which elevation determined the range. Later a piece of wood or metal, called a dispart, was secured to the muzzle so as to give a line from breech to muzzle parallel to the gun's axis: such a line of sight had to be directed more or less above the target according to the range. Early in the last century the present method of having one fixed and one movable sight, so that the line between them, which is the line of sight, can be adjusted at any desired angle with the axis of the gun, came into use. It is customary to make the rear sight the movable one, and to put range marks on it so that if, for example, it is set at the mark 2,000 yards, the angle between the line of sight and the axis of the gun is the angle of elevation necessary to give the projectile a range of 2,000 yards. Besides the movement of the rear sight up or down, to insure the gun's having proper elevation, it is also usual to have means of moving it sidewise, so that the line of sight can be adjusted to make any desired small angle, in the horizontal plane, with the axis of the gun, and thus the drift of the projectile may be allowed for by causing the gun to point the proper amount to one side of the target at which the line of sight is directed.

If now gun and target are stationary, if there is no wind, if the air is of standard density, if the sight is set for the correct distance of the target, and so as to compensate for the drift at that distance, and if the line of sight is accurately pointed at the centre of the target, then the mean trajectory will pass through that centre and the chance of hitting will be a maximum. The first difficulty is that the line of sight cannot be accurately directed, since to do so requires the eye to determine when three objects at different distances (rear sight, front sight and target) are exactly in line; with the telescope sights now coming into general use this source of error is practically eliminated. In the next place the distance is never exactly known; there is always some movement of the atmosphere; the density of the air may readily be as much as 9 per cent greater or less than on the average; the target is usually in motion; and in the case of naval guns the gun is always in motion. The skill of the gunner, then, consists, first, in estimating the total lateral deviation which will result from wind and motion of gun and target at right angles to the plane of fire, and pointing sufficiently to one side of the target to compensate therefor; and second, in so adjusting the elevation of his gun as to compensate for the vertical deviation due to wind and motion of target in the line of fire, to angular motion of the gun if such exists, and to abnormal air resistance. With modern guns, mounted on shore, where the platform is stationary and the distance of the target can be measured with comparative accuracy, the percentage of hits upon a target of ordinary size should be very large, even at long range, if the gunners are well practised. Under the conditions of naval actions it is not surprising that in the past the percentages of hits have been extremely small, and it is not to be expected that they will ever be large, at least during such parts of actions as are fought at long range.

PHILIP R. ALGER,
U. S. Naval Academy, Annapolis.

Gun'nison, a river of Colorado which rises in Cochetopa Hills, Saguache County, flows north to Parlin, then west to Gunnison, near Cimarron enters the Grand Cañon of the Gunnison 15 miles long, and continuing in a northwesterly direction past Delta unites with the Grand River at Grand Junction after a course of nearly 200 miles.

Gunny, a jute (see JUTE) cloth, also a bag or sack. Gunny-bags are very largely exported from India to various parts of the world. American cotton is largely packed in these. They can be manufactured at a low price, hence the great demand for them. The name gunny is applied to the cloth as well as to the made-up bags. About 1850 the peasant hand-looms of Lower Bengal met both the home and the foreign demand for Indian-made gunny-bags — indeed the making of these was then the great domestic industry of that portion of India. At the present time the number made at the great steam-factories, of which there are now 23 in India, far exceeds what is produced

by hand-looms. For example, in one year 82,-779,207 gunny-bags were exported from India, of which only 5,000,000 were woven by hand.

Gunpowder, an explosive substance formed by mixing saltpeter, charcoal and sulphur together. The mixture may vary in composition between quite wide limits, and yet possess explosive properties; but the proportions adopted by the United States governmental authorities are saltpeter, 75 per cent; charcoal, 15 per cent; and sulphur, 10 per cent. The saltpeter used is the India saltpeter or niter, which is known to chemists as potassium nitrate, and although found native as an incrustation on the soil in India it is to-day largely made from Chile saltpeter, or sodium nitrate, by reacting on the latter with potassium nitrate. It is carefully purified, finely ground and thoroughly dried for use, in the manufacture of gunpowder. The charcoal most suitable for gunpowder is that variety which is mostly readily ignited, most quickly burned and gives the least quantity of ash. Such charcoal is produced from dogwood, willow or alder, by heating the air-dried woods in closed iron cylinders or retorts out of contact with air so that they undergo destructive distillation and leave the charcoal as a residue, this method of manufacture having been invented in England by Bishop Landloff and adopted in that country in 1797. The dogwood, which is really the alder-buckthorn, *Rhamnus Frangula,* is cut when one inch in diameter; the willow and alder when four inches; though these dimensions vary in practice. The wood is cut in the spring when in full sap, stripped of its bark and seasoned by an exposure of two to three years; the dogwood being stacked under shelter, but the other woods in the open so that the rain may wash the sap from the wood and the sun's rays and the air may destroy the spiral cells. The charring is effected by fires outside the retorts or by passing superheated steam or hot carbon dioxide gas through the retorts. The character and yield of the charcoal produced varies with the temperature to which the wood is exposed and the time of exposure. When the wood is heated to 290° C. red charcoal is formed; when heated to 350° C. or above, black charcoal is produced. When the heating is done quickly the yield of charcoal is much larger than when the heating is slow. Red charcoal is much more easily ignited and burns faster than black charcoal. Charcoal for the manufacture of gunpowder is ground to a fine powder by rotation in a drum with a quantity of brass or bronze balls. Sulphur of commerce is purified for use in this manufacture by fusion and distillation; being eventually obtained in the form of roll brimstone, which is then crushed to a fine powder by heavy rollers. It must be free from sulphuric and sulphurous acids, as well as solid impurities, and should consist entirely of that modification of sulphur which is completely soluble in carbon disulphide.

The dry, finely ground and sifted saltpeter, charcoal and sulphur are weighed into the mixing machine, which consists of a gun-metal drum arranged to make 40 revolutions a minute and provided with hollow bearings through which a shaft is passed which carries 44 arms or fliers of such length as to just clear the interior surface of the drum. This shaft revolves in an opposite direction to and with twice the speed of the drum. After the ingredients are put in the drum the mixing is carried on for five minutes and then the mixture goes to the incorporating or wheel mill. The process of incorporation is of the greatest importance in this manufacture. It consists in the long continued grinding together of the ingredients in order to mix them so intimately that the product appears to the naked eye as a homogeneous mass, for, unless this be done, complete reaction between the components of the powder by combustion cannot be expected. The finished gunpowder depends for its excellence largely upon the completeness and thoroughness of the incorporation. The incorporating mill consists of a circular bed of iron or stone on which the mixture is placed. A vertical shaft rising through the centre of this bed carries a horizontal one, on the two ends of which heavy stone or iron wheels, called edge runners, are hung. These wheels rotate about the horizontal shaft and, as the vertical shaft revolves, they travel at the same time in a circle around the bed so that, at the points on the bed where the edge runners touch, the motions of rotation and translation are converted into a twisting motion, like that of a muller, and the material beneath is thus overturned and very intimately mixed. The edge runners weigh from three to seven tons, are from four to seven feet in diameter, and are so movable on the spindle that they can accommodate themselves to varying thicknesses of powder on the bed. One of the edge runners is a little nearer the vertical shaft than the other, so that they travel in different paths and they are followed by a scraper which throws toward the centre of the bed the material that has been forced to the exterior by the edge runners. To incorporate, 50 pounds of the mixture are spread out on the mill-bed and slightly moistened and the wheels are set in motion. If the wheels are of stone weighing 3½ tons and making 7½ revolutions per minute, the incorporation is completed in 3½ hours. If the wheels are of iron weighing 4 tons and making 8 revolutions per minute, 2½ hours are required for cannon powder. The operator does not remain constantly in the mill but goes in occasionally to wet the charge, from 2 to 10 pints of water being used in accordance with the weather. The chief danger from accidental explosions during the manufacture of gunpowder is found in the incorporating mills; fortunately there is less explosive material here at any time than there is at any other part of the works. To render the damage done by an explosion as slight as possible, the buildings in which these operations are conducted are built with a strong framework covered with light boards, or else with three sides of stone and the fourth and roof of light wood, so that when an explosion occurs the framework or the stone walls remain. These mills are usually built in groups, and to prevent an explosion in one being communicated to the others, each is provided with a drenching apparatus which automatically wets and protects the charges in the mills adjacent to the one which is blown up. The communication of fire or explosion is also arrested by means of barricades built about the mills which consist of masonry filled with earth, or simple earth mounds or sometimes wooden structures built in the shape of a letter A.

When the incorporation is completed the mill cake, as the mixture is now called, is removed from the bed and runners by means of a copper chisel and wooden mallet. It is partly in the form of a compact cake and partly fine meal and in this condition it is put into the press. This is a powerful hydraulic press with a rectangular box which is divided into compartments of the desired width by means of copper or gun-metal plates. When the spaces between the plates have been filled with mill cake, pressure is applied which causes the particles to cohere, and the gunpowder is taken from the press in sheets having an area equal to that of the plates and a thickness dependent on the width of the filling space, the amount of the pressure applied and the duration of its application. Sometimes the press plates are corrugated like waffle irons, as for instance, in the manufacture of waffle and of hexagonal powders, and sometimes they are replaced by a press block filled with molds in each of which a separate grain is pressed, as in the manufacture of cocoa or prismatic powder. The operation of pressing is a most important one, since the density of the finished powder depends upon it and, as it is markedly affected by even slight changes in atmospheric conditions, it is a very nice one.

The press cake passes to the corning or granulating machine, where it is cut into grains. This machine consists of a hopper into which the charge is fed, an elevating band, an endless revolving table, four pairs of rollers and several sets of screens for sorting the grains according to size into boxes placed to receive each different size. The rollers, which are of gun-metal, are corrugated or provided with teeth, the upper two being coarser than the lower, and they are adjusted to the size of grain required. When the hopper has been emptied a clutch is relieved which stops the machine and at the same time rings a bell which notifies the operator of the fact for, as the machine is self-feeding, the workmen are not obliged to be present while it is at work. The grains are now freed from dust by passing through horizontal cylindrical sieves such as are used in flour-mills and they are then glazed by rotation in wooden barrels where, by the friction of the grains against each other, their angles are rounded off and a hard polished surface is imparted to them whereby they become better able to bear transportation and are less likely to absorb moisture. Sometimes the grains are coated with graphite which is put in the glazing barrel with them. Though but 4 ounces of graphite are used to 1,200 pounds of gunpowder it is considered objectionable for use with fine grain regulation powder as it delays ignition and fouls the piece, yet it improves powder to be used in fixed ammunition, in that it enables the grains to readily pack close together. As more dust is formed during the glazing process the grains are again put through the dusting reels and are then exposed for a day in the drying house to a temperature of from 125° to 130° F. The finished powder is packed in 1-pound tins or 25-pound kegs, though other sized packages are produced to some extent. According to the size or form or structure of the grains gunpowder is known as *mealed powder, superfine*, designated by the mark *F.F.G.; fine grain, F.G.; large or coarse grain, L.G.; large grain for rifles, R.L.G.; mammoth, pebble, pellet, cubical, hexagonal, spherohexagonal, waffle, Fassano* or *progressive,* and *cocoa* or *brown prismatic powder.* Mealed powder is in the form of dust and is used for driving fuses for ammunition and in pyrotechny. Fassano or progressive powder is formed by pressing mill cake to a density of 1.79, then breaking this press cake into ⅛ to ¼ inch grains, mixing these grains with a prescribed quantity of fine grain powder, pressing this mixture to a mean density of 1.76 and breaking this press cake into grains about 2½ inches square by 1¾ inches thick. By this means a grain of varying density was obtained which burned progressively. This feature was introduced into powder-making by Prof. R. Ogden Doremus of New York, but was developed in Europe. Cocoa or brown prismatic powder is the final stage of development of the compressed perforated grain invented by Gen. Rodman of the United States army. In experimenting with the 15-inch and 20-inch smooth-bore guns invented by him, Gen. Rodman found that he could reduce the initial pressures, while securing the desired velocities, by using perforated disks of compressed powder which were of a diameter equal to the calibre of the gun and between 1 and 2 inches in thickness. He styled this charge a "perforated cake cartridge" and in his 'Properties of Metals for Cannon and Qualities of Cannon Powder,' published in Boston, Mass., in 1861, he mathematically demonstrated that at the beginning such disks presented the minimum of free surface to combustion but as the powder burned there was a constant enlargement of the perforations, whereby the area of surface exposed to combustion was constantly increased and that therefore the volume of evolved gases increased as the volume of the chamber, due to the travel of the projectile, increased, in consequence of which the pressure was more uniformly distributed along the bore than it had been with the granulated powders hitherto employed. Owing to difficulties in manufacture and use, Rodman later found it convenient to build up his charges with perforated hexagonal prisms of comparatively small size. The Civil War prevented the further development of this novel idea in powder-making in this country at that time, but a Russian military commission, which visited the United States during the Civil War, was so impressed by what Rodman had accomplished, that on its recommendation the manufacture was taken up and carried on in Russia on an extensive scale, and it soon spread to other countries. About 1880 Germany adopted cocoa powder, which was a brown prismatic powder with a single canal, the grains having the form of an hexagonal prism, 1 inch in height by 1.36 inches in diameter, and a density of 1.86. This powder, however, differed from ordinary gunpowder both in the kind of charcoal used and in the proportions of the components. The charcoal was underburned or red charcoal made from rye straw, and the composition was saltpeter 80.50 per cent, charcoal 16.00 per cent, sulphur 2.50 per cent, and moisture 1 per cent. Cocoa powder was so successful for use in modern high-powered rifle guns that it was sought for by all military nations and the want was met in this country by substituting for the rye straw charcoal red charcoal from wood and carbohydrates, such as sugar, and this brown prismatic powder

was used in our modern large calibre guns until displaced by smokeless powder.

Although very great care is exercised in the manufacture of gunpowder, yet there are so many opportunities for variations to occur in each of the many steps of the process that even the best powder-makers cannot regularly produce powder that will always give the same pressure and velocity in the same gun. Since, in order to ensure accuracy of fire, the successive powder charges used must possess the same ballistic properties this result is secured by proving a number of factory runs by firing trials and then mixing these together in the proportions required to produce the desired result. This process is called blending. It was practised by Benvenuto Cellini and has been in vogue ever since.

Good black gunpowder should have a perfectly uniform slate color and it should show no difference in color when crushed. If it is bluish or quite black it contains too much charcoal or is too damp, while the presence of bright points or bluish-white spots indicates that the saltpeter has effloresced. If the powder soils the hand or a sheet of paper when run over them it contains too much moisture or else meal powder. On pressing the powder in the hand it should not crackle or be easily crushed and when crushed the grains should not fall at once to dust, but should first split into angular fragments. Three different densities are determined for gunpowder, each of which furnishes valuable information. These are the gravimetric density which is the weight of a unit volume of powder grains including the air between and enclosed in them; the relative density, which is the weight of a unit volume of powder grains excluding the air between them but including that contained in the pores of the grains; and the absolute specific gravity, which is the weight of the powder exclusive of all air.

Since smokeless gunpowder has been perfected and adopted for use in guns of all calibres it has been declared that it would supersede black gunpowder altogether; yet the census of the United States for 1900 shows that there were over 25,000,000 pounds of black gunpowder made in this country in that year and the production bids fair to be large for many years to come, because in ordnance it is necessary to use a priming charge of black gunpowder with which to fire the smokeless gunpowder; because smokeless powder cannot be efficiently substituted for black gunpowder in the older forms of small arms that are widely scattered over the country; because black powder is most suitable for use in fuses and in pyrotechny; and because smokeless powder is too expensive and inferior for use in saluting.

Gunpowder was formerly used in blasting as well as for a propellent, but usually a special mixture containing as little as 60 per cent of saltpeter was prepared for this purpose. In 1857 Lamotte Dupont of Wilmington, Del., invented *blasting powder* which differs from gunpowder chiefly in that Chile saltpeter is used in place of India saltpeter. Though cruder materials are used and less care is taken the methods pursued for its manufacture are in general similar to those used for gunpowder.

CHARLES E. MUNROE,
The Columbian University, Washington, D. C.

Gunpowder Plot, a famous conspiracy formed in England in 1604 by Robert Catesby, and a small band of other Roman Catholics, who, goaded into excitement by the penal laws directed against their faith and its professors, aimed to blow up the Houses of Parliament by gunpowder 5 Nov. 1605. An anonymous letter of warning, sent to Lord Monteagle, led to the discovery of the plot, and the various conspirators were arrested and executed. Among those put to death was Guy Fawkes, who had been caught in the vault below the House of Lords with matches ready to fire the train. Since 1605 all places connected with the Houses of Lords and Commons where explosives could be stowed away are annually searched at the opening of Parliament.

Gunsaulus, gŭn-sâ'lŭs, **Frank Wakeley,** American clergyman and educator: b. Chesterville, Ohio, 1 Jan. 1856. He was graduated at the Ohio Wesleyan University in 1875, was ordained to the Methodist ministry, but became a Congregationalist. He was pastor of Congregational Churches at Columbus, Ohio (1879–81), Newtonville, Mass. (1881–5), and Baltimore, Md. (1885–7). In 1887 he became pastor of Plymouth Church, Chicago, and from 1899 of the Central Church of that city. For some years he was also president of the Armour Institute of Technology, Chicago, resigning in 1901. He is well known as a platform lecturer, and has published: ‹Monk and Knight› (1891); ‹Phidias› (1893); ‹Gladstone› (1898); ‹The Man of Galilee› (1899), and other works.

Gunshot Wounds are wounds caused by missiles projected from firearms by the explosion of gunpowder, etc. Such wounds present great diversity of form, depending on the kind of missile. All show more or less contusion and laceration of the tissue, particularly beneath the surface. Of the two wounds usually caused, that of entrance and that of exit of the missile, the latter is usually the larger. Deflection of the missile from the straight line by hard tissue is common. Thus a ball striking the front of the chest may pass around the ribs, emerging at the back. Infection of the bullet itself, particularly when driven at high speed, is not common; and as the presence of a bullet in the body is not of itself dangerous, the error of much probing along the track is evident. A bullet readily located (the X-rays are now largely used for this purpose) is ordinarily extracted, and where signs of infection become evident the conversion of the punctured wound into a free large open wound is necessary.

Gun'ter, Archibald Clavering, American author: b. Liverpool, England, 25 Oct. 1847. He was a mining and civil engineer in the West from 1867 until 1875, when he became a stock broker at San Francisco. In 1878 he removed to New York, where he devoted himself to writing plays and novels. The best known of the former are: ‹Courage›; ‹Prince Karl›; and ‹The Deacon's Daughter.› His works of fiction, sensational volumes, largely without literary merit, include: ‹Mr. Barnes of New York› (1887); and ‹Mr. Potter of Texas› (1888); both successfully dramatized; ‹That Frenchman› (1889); ‹Miss Nobody of Nowhere› (1890); ‹Baron Montez of Panama and Paris› (1893); and ‹Adrienne de Portalis› (1900).

Günther, gün'tĕr, **Siegmund,** German geographer and mathematician: b. Nuremberg 6 Feb. 1848. Educated at several German universities he became professor of geography in the School of Technology at Munich, in 1886. Among his many valuable professional works may be named 'Lehrbuch der Determinatentheorie' (1875); 'Parabolische Logarithmen und parabolische Trigonometrie' (1882); 'Die Meteorologie ihrem neuesten Standpunkt gemäss dargestellt' (1889); 'Lehrbuch der physikalischen Geographie' (1891).

Gun'ton, George, American economist: b. Cambridgeshire, Eng., 8 Sept. 1845. He came to the United States in 1874, and until 1880 was a writer on economic subjects. He then turned his attention to sociological and economic work, and in 1890 became president of the Institute of Social Economics and editor of the 'Social Economist,' which in 1896 became 'Gunton's Magazine.' His publications include 'Wealth and Progress' (1887); 'Principles of Social Economics' (1891); 'Trusts and the Public' (1899).

Guntown, Battle of. After Gen. Forrest's capture of Fort Pillow, 12 April 1864, Gen. Sturgis was ordered to march from Memphis to intercept him, but before the expedition got fairly under way it was ascertained that Forrest had fallen back to northern Mississippi. On 1 June Sturgis started from White's Station, near Memphis, with about 5,500 infantry and artillery, under Col. McMillan, and 3,400 cavalry, under Gen. Grierson, to defeat Forrest and prevent his interference with Sherman's advance on Atlanta. Moving southward, Sturgis reached Ripley, 80 miles from Memphis, on the 8th, and on the 10th struck the Mobile & Ohio Railroad near Guntown, Miss., where Grierson, in advance with the cavalry, met Forrest's cavalry near Brice's Cross-roads, and became immediately engaged. Sturgis, who was six miles in rear with the infantry, moved on the double-quick, followed by a train of 250 wagons and, coming to where Grierson was engaged, without giving his exhausted men a moment's rest, and badly handling them, threw them into the fight. In three hours' time Forrest routed him, drove him from the field in confusion, captured prisoners, guns, and wagons, and closely pursued him to near Ripley. There, early on the morning of the 11th, his rear-guard, taking advantage of a small stream, after a sharp fight checked Forrest, and Sturgis continued his retreat to Memphis, having lost 23 officers and 594 men killed and wounded, 1,623 prisoners, 14 guns, and his entire train of 250 wagons, with 10 days' rations and a large supply of ammunition. Forrest's engaging force did not exceed 4,000 men; his loss was 492 killed and wounded. Consult: 'Official Records,' Vol. XXXIX.

E. A. Carman.

Gur'don, Lady Eveline Camilla Wallop, English writer: d. 1894. She was the second daughter of the fifth Earl of Portsmouth, and was married to Sir William Gurdon in 1888. Her contributions to periodicals were collected after her death in a volume entitled 'Suffolk Tales' (1896), in certain respects one of the most noteworthy English collections of short stories, both as regards style and sympathetic treatment.

Gurhwal, gŭr-wäl', India. See Garhwal.

Gurjun (gėr'jŭn) **Balsam,** or **Wood Oil,** the juice or liquid of the *Dipteraceæ* which grow in the Andaman Islands. It resembles copaiba balsam, and has at various times been sold as such. Its chief use in the East is as a varnish for boats and for preventing the attacks of ants on timber. It was used for the checking and alleviating of leprosy by the late Father Damien among the lepers of Molokai, in Hawaii.

Gurkhas, goor'kaz. See Ghurkas.

Gurko, goor'kō, **Ossip Vladimirovitch,** Russian soldier: b. 15 Nov. 1828; d. 28 Jan. 1901. He took part as captain in the Crimean war and as lieutenant-general commanded the Russian advance-corps which at the beginning of the war with Turkey crossed the Danube and seized Tirnova (July 1877). In the same year he captured Gorny Dubnik and Telish, and on 15–17 Jan. 1878 defeated Suleiman Pasha at Philippopolis. He was governor-general of St. Petersburg in 1879–80, of Poland in 1883–94, and in 1894 was retired with field-marshal's rank. He was among the foremost Russian generals of recent times.

Gurnards, gėr'nardz, a family of teleost fishes (*Triglidæ*) occurring in all warmer seas, resembling somewhat the sculpins in the rough spiny bones of the skull, but differing in having the body regularly scaled or covered with bony plates. The fantastic sea-robins (*Prionotus*) are common representatives on our coasts. Closely allied are the flying-gurnards (family *Cephalacanthidæ*) of the warmer seas, in which the pectoral fins are very long, enabling the fish to flutter a short distance in the air.

Gurney, gėr'nĭ, Sir **Goldsworthy,** English inventor: b. Cornwall, England, 1793; d. 1875. He built a steam carriage in 1827, and was the first to devise and use the high-pressure steam-jet in locomotion. He invented the oxyhydrogen blow-pipe, and the Drummond light.

Gurney, Joseph John, English Quaker philanthropist: b. Earlham Hall, near Norwich, England, 2 Aug. 1788; d. there 4 Jan. 1847. He was a banker in Norwich and in 1818 became a preacher in the Society of Friends, and the same year accompanied his sister, Mrs. Elizabeth Fry (q.v.), on her tour to Scotland, having warmly taken up the benevolent cause to which she had devoted herself — the amelioration of the condition of prisoners. In 1827 the two made a journey to Ireland with the same object, and in 1837 Gurney visited the United States and Canada, where he was absent for nearly three years. He went with Mrs. Fry in 1841 to Holland, Belgium, and Germany, and in 1842–4 visited France and Switzerland. The object of these journeys was to reform prison management, and effect the abolition of slavery in the French colonies, for which purpose he had interviews with Louis Philippe and M. Guizot. He was the author of 'Notes on Prisons and Prison Discipline' (1819); 'Observations on the Religious Peculiarities of the Society of Friends' (1824); 'Essays on the Evidences, Doctrines, and Practical Operation of Christianity' (1827); 'Winter in the West Indies Described in Familiar Letters to Henry Clay of Kentucky' (1840).

Gurowski, goo-rôf'skē, **Adam de,** Count, a Polish scholar and author: b. Kalisz 10 Sept.

1805; d. Washington, D. C., 4 May 1866. In early life he was a leading Polish patriot, and an instigator of the revolution of 1830. Later he became an advocate of Panslavism, and was employed in Russia. In 1841 he left the latter country and in 1849 came to the United States, and from 1861 to 1863 was a translator in the State Department at Washington. Among his works, several of which were written in French and German, are: 'Civilization and Russia' (1840); 'Panslavism' (1848); 'Russia as It Is' (1854); 'The Turkish Question' (1854); 'America and Europe' (1857); 'My Diary: Notes on the Civil War' (1862–6).

Gur'teen, Stephen Henry Villiers, American Protestant Episcopal clergyman and sociologist: b. near Canterbury, England, 9 June 1840; d. 1898. He was educated at Jesus College, Cambridge, and was ordained in 1875. He was professor of Latin at Hobart College, Geneva, N. Y., was successively rector of Trinity Church, Buffalo, and Trinity Church, Toledo, Ohio, and dean of St. Paul's Cathedral in Springfield, Ill. He interested himself in charity organization, and was instrumental in forming the Order of Associated Charities. He wrote: 'Phases of Charity' (1877); 'Provident Schemes' (1879); 'What is Charity Organization?' (1879); 'Handbook of Charity Organization' (1882); 'How Paupers are Made' (1883); 'Beginnings of Charity Organization in the United States' (1894).

Güssfeldt, Paul, powl güs'fĕlt, German explorer: b. Berlin 14 Oct. 1840. He studied science and mathematics between 1859 and 1865 in Heidelberg, Giessen, and Bonn. The German African Company sent him out on an expedition in 1872 to explore the Loango coast. He was shipwrecked near Freetown (14 Jan. 1873), and landed at the mouth of the Kongo. He has given an account of this expedition in the work 'The Loango Expedition' (1879), which he wrote in collaboration with his fellow travelers Falkenstein and Pechuel-Loesche. In 1876 he explored the Arabian Desert, and in September 1882 he visited South America. Among the Andes he discovered a vast area of glaciers, in lon. 34° 30′ S. He climbed the highest peak of the volcanic range of the Andes (21 Feb. 1882) and reached the edge of the crater of Maipó, and during April and May of the same year explored the lofty plateaus of Bolivia. He has published 'In den Hochalpen' (1893); 'Reise in den Anden von Chile und Argentinien' (1887); 'Der Mont Blanc' (1894).

Gustavus (gŭs-tā'vŭs) **I.** (commonly called Gustavus Vasa), king of Sweden: b. Lindholmen 12 May 1496; d. Stockholm 29 Sept. 1560. He studied at the University of Upsala, and entered the service of Sten Sture the younger, administrator of the kingdom, in 1514. Sweden had, by the union of Calmar, become subject with Norway to the crown of Denmark. The country was at this time divided into two parties. There was a Danish party headed by the Archbishop of Upsala, and a Swedish party, which upheld the independence of the country, headed by the administrator whom it had raised to power. Gustavus fought with distinction under Sture against the Danes in 1517 and 1518. He was one of six hostages sent by Sture as guarantee of the safety of King Christian II., but effected his escape, and reached Lübeck in 1519. After wandering about for some time as a proscribed fugitive he took refuge in the mines of Dalecarlia, where he worked as a common laborer. After various adventures he attempted open resistance. Christian II. was crowned at Stockholm on 4 Nov. 1520. On the 8th the leaders of the Swedish party, among whom was Gustavus' father, were executed. By the beginning of 1521 Gustavus had raised a considerable force, driven the Danes from several positions, and excited a general insurrection in Dalecarlia. In April he defeated the Danes at Westeraas; in July he seized Upsala, and in August was named administrator of the kingdom by the states which had assembled at Wadstena. On 6 June 1523 he was elected king by the Diet of Strengnäs. In 1527 he obtained the exclusion of the bishops from the senate, and their subjection to the civil power. He now openly professed Lutheranism, and was crowned by a Protestant archbishop of Upsala on 12 Jan. 1528. The Lutheran religion was formally established at a diet held at Orebro in 1529. In 1544 the states assembled at Westeraas declared the kingdom hereditary in his house. A war broke out with Russia in 1555, which was concluded by the Peace of Moscow, 2 April 1557.

Gustavus II. (Gustavus Adolphus), king of Sweden, grandson of Gustavus Vasa: b. Stockholm 9 Dec. 1594; d. Lützen, Saxony, 16 Nov. 1632. He was trained to war under experienced generals, and at 16 took his place in the state council. Charles IX., the father of Gustavus, had been declared king to the exclusion of his nephew Sigismund, who, on accepting the crown of Poland during his father's lifetime, had abjured the Protestant religion. On the death of Charles, Gustavus succeeded him, with the consent of the states, as king-elect. Sweden was at this time at war with Denmark, and Gustavus was in command of the army. He chose for his chancellor and first councillor Axel Oxenstiern, a man 10 years his senior, and already eminent for his ability, who eventually proved himself to be one of the greatest of European statesmen. The war with Denmark was concluded through the mediation of England in 1613. A new enterprise at this time presented itself to the ambition of Gustavus — the throne of Russia was vacant and contested. A party favored the election of Charles Philip, the brother of Gustavus, and was supported by a Swedish invasion under Gen. de la Gartie, who had penetrated to Novgorod; while the Poles, who had also invaded Russia, had reached Moscow. Michael Romanoff was, however, elected czar. Gustavus took a personal share in the Russian war, which continued for about four years after this election, and had made considerable conquests in Livonia and the neighboring provinces when peace was concluded at Stolbova in 1617. In 1620 he married Eleanora, sister of the elector of Brandenburg. The war with Russia was followed by war with Poland, which lasted nine years, and was concluded on advantageous terms for Gustavus by a six years' truce in September 1629. He had made important conquests, which he was allowed to retain, in East Prussia.

His attention was now diverted from northern wars by the affairs of Germany. The oppression of the Protestants by Ferdinand II.

excited his sympathy. He was alarmed by the progress of Wallenstein, which threatened to extend the empire to the Baltic, and by leaguing himself with the Protestants of Germany he might hope for easier and more extensive conquests than by struggling single-handed against the northern powers. He named his daughter Christina heiress to the throne, embarked for Germany in May 1630, and landed with an army of 13,000 men in the island of Usedom on the coast of Pomerania. (See THIRTY YEARS' WAR.) After repeatedly defeating the imperial generals, and conquering a great part of Germany, he was killed in the battle of Lützen. Gustavus differed from some other great commanders in preferring a small well-ordered army to a large one, asserting that all over 40,000 men were an encumbrance. His character made him beloved by his soldiers, and he was served with a devotion which enabled him to effect great things with small means. The discipline he imparted to the Swedish army, and the prestige of success derived from his victories, lasted long after his death. His body was taken to Sweden. See Droysen, 'Gustav Adolf' (1879); Stevens, 'History of Gustavus Adolphus' (1885); Fletcher, 'Gustavus Adolphus' (1891); Dodge, 'Gustavus Adolphus' (1896).

Gustavus III., king of Sweden: b. Stockholm 24 Jan. 1746; d. there 29 March 1792. He was the eldest son of Adolphus Frederick, duke of Holstein, who had been called to the Swedish crown in 1743, and succeeded his father on 12 Feb. 1771. He found the country divided between two aristocratic factions, the adherents of France and Russia, known respectively as the Hats and Caps. He resolved to give the country a new constitution, and to increase the power of the crown. He instituted a new military order of Vasa, in order to gain the goodwill of the officers; and effected his purpose by means of a sham revolt, which enabled him to assemble troops, wherewith he surrounded the assembly of the states-general, and forced them to accept his constitution, which, as it only circumscribed the privileges of the nobility, was generally popular. In 1788, when war had broken out with Russia, the nobles revenged themselves by inducing the states-general to refuse himself supplies. The fidelity of the Dalecarlians enabled him to repulse the enemy. To free himself from the hostility of the nobles he determined on another *coup d'état*, which he executed on 3 April 1789, by causing the leaders of the opposition to be arrested, and then passing a law extending the royal prerogative. He concluded peace with Russia by the Treaty of Varela in August 1790. The Swedes were opposed to an alliance with Russia, and a diet which Gustavus assembled at Gefle for the purpose of procuring supplies, though surrounded with troops, proved so refractory that he was obliged to dismiss it. The nobles long before this had formed a conspiracy against him, and resolved on his death. Three of them took an oath to murder him, and drew lots which should carry out their intention. The lot fell on Captain Ankarström, who shot the king in the back at a masquerade given at the opera house at Stockholm, 16 March 1792. See Bain, 'Gustavus III. and his Contemporaries' (1895).

Gustavus IV., Adolphus, king of Sweden: b. 1 Nov. 1778; d. Saint Gall, Switzerland, 7 Feb. 1837. He succeeded on the death of his father, Gustavus III., and, on assuming power, showed that he had inherited his father's hatred of the principles of the French revolution, which he carried to the extent of fanaticism. In 1803 he made a journey to Germany to promote a union of the German princes against Napoleon. He was at Karlsruhe when the Duke D'Enghien was seized, and sent his aide-de-camp to Paris to protest against that act of violence. After the Peace of Tilsit he exposed himself to a war with Russia while he was at war with France, by refusing to join the continental blockade and opening his ports to England; and in 1808 he quarreled with England, his only ally. His internal policy was as bad as his external. His subjects were oppressed with taxes to support his wars, and had in return the humiliation of finding Pomerania in the possession of France, and Finland in that of Russia. A conspiracy was formed against him; he was deposed, and the diet by a decree of 10 May 1809 declared his family forever incapable of succeeding to the crown of Sweden. His uncle, the duke of Sudermania, was proclaimed king, under the title of Charles XIII., and in the following year adopted as his successor, Bernadotte, prince of Pontecorvo. Gustavus died in poverty. He took the title of Colonel Gustafson, and has left, among other writings, 'Memoirs of Colonel Gustafson' (1823). See Kleinschmidt, 'Die Irrfahrten Gustavus IV. Adolf von Schweden' (1888).

Gutenberg, goo'tĕn-bĕrg, **Johannes or Henne**, German inventor of printing with movable types: b. Mainz about 1400; d. there 23 Feb. 1468. Little or nothing is known of his early life. In 1434 he was living in Strasburg, and in 1436 entered into a contract with one Andreas Dryzehn or Dritzehn and others, binding himself to teach them all his secret and wonderful arts, and to employ them for their common advantage. The death of Dryzehn, which happened about the end of 1438, broke off the undertaking of the company. About 1448 he returned to Mainz, and soon formed a copartnership with Johann Fust or Faust, a rich goldsmith who furnished money to establish a press, in which the Latin Bible was first printed. This, the Mazarin Bible, begun about 1450 and finished about 1455, is the first book known to have been printed with movable types. After some years this connection was dissolved. Fust had made large advances, which Gutenberg was now called upon to repay; and as he either could not or would not do it, the subject was carried before the tribunals. The result was that Fust retained the press, which he improved, and continued to use in company with Peter Schöffer of Gernsheim. By the patronage of a counsellor of Mainz, Conrad Hummer, Gutenberg was again enabled to establish a press the following year, from which there issued the fine 'Catholicon' of 1460, and also the 'Letters of Indulgence' of 1454 and 1455. Gutenberg's name does not appear in any production of his press, nor do any of his friends and patrons mention him in connection with the invention of printing. See Van der Linde, 'Gutenberg' (1878), and 'Geschichte der Erfindung der Buchdruckerkunst' (1886); Hessel, 'Gutenberg: Was He the Inventor of Printing?' (1882); 'Haarlem the Birthplace of

Printing, not Mentz' (1887); Gordon Duff, 'Early Printed Books' (1893).

Guthrie, Thomas, Scottish clergyman and philanthropist: b. Brechin, Forfarshire, 12 July 1803; d. Saint Leonard's, Sussex, 24 Feb. 1873. He was educated at the University of Edinburgh, and was licensed as a preacher in connection with the Church of Scotland in 1825. He accepted a call to Greyfriars, Edinburgh, in 1837, where he soon became very popular with all classes. In 1843 the Disruption took place, and Guthrie was active with Chalmers and Candlish in organizing the Free Church, becoming minister of Free St. John's, Edinburgh. The work with which his name is chiefly identified out of Scotland, was the establishment of ragged schools, of which he was the earliest advocate. He was widely known for his gifts as an orator, and on retiring from the ministry in 1864 was editor of 'The Sunday Magazine' till his death. Among his published works are: 'The Gospel in Ezekiel' (1855); 'A Plea for Ragged Schools' (1847); 'The City: its Sins and Sorrows' (1857); 'Autobiography' (1874-5). See Smeaton 'Thomas Guthrie' (1900).

Guthrie, Thomas Anstey ("F. Anstey"), English humorist: b. Kensington, London, 8 Aug. 1856. He was graduated from Cambridge in 1875, and called to the bar in 1880, but never practised and has devoted himself to authorship, his books having been extremely popular both at home and in the United States. He is the author of 'Vice Versa' (1882); 'The Giant's Robe' (1883); 'The Black Poodle' (1884); 'The Tinted Venus' (1885); 'A Fallen Idol' (1886); 'The Pariah' (1889); 'Tourmalin's Time Cheques' (1890); 'Voces Populi' (1890); 'Mr. Punch's Pocket Ibsen' (1893); 'Puppets at Large' (1897); 'Love Among the Lions' (1898); 'The Brass Bottle' (1900); 'A Bayard From Bengal' (1902); etc.

Guthrie, William Norman, American Episcopal clergyman and author: b. Dundee, Scotland, 4 March 1868. He was graduated from the University of the South in 1889 and was professor of modern languages there 1889-90, and at Kenyon College, Ohio, 1892-3. He entered the Episcopal ministry in 1893, and has since been rector of several Cincinnati churches. He has published: 'Love Conquereth' (1890); 'Modern Poet Prophets: Essays Critical and Interpretative' (1897); 'Songs of American Destiny' (1900).

Guthrie, Okla., the capital of the Territory of Oklahoma and the county-seat of Logan County, on the Cottonwood River and on the Atchison, Topeka & Santa Fe, the Chicago, Rock Island & Pacific, the Oklahoma Eastern, the M. K. & T., St. Louis & San Francisco, Fort Smith & Western, Denver, Enid & Gulf, and the St. Louis, El Reno & Southern Rys.

Industries, Etc.— Guthrie has a very large trade, and is especially noted as a wholesale distributing centre. It has planing, flour and cotton-seed oil mills, furniture and carriage factories, a foundry and machine shops, a broom works, a plow factory, creamery, railroad repair shops, novelty works, book bindery, etc.

Buildings, Educational Institutions, Etc.— Guthrie's chief buildings are the capital, Federal court and post-office building, the city hall, the Scottish Rite temple, Carnegie Library, and the Federal prison. The Carnegie Library (costing $25,000) is a noteworthy institution. The city possesses an excellent public school system, including a high school, Saint Joseph's Academy, and many private schools add to the city's educational facilities. A $50,000 county high school has just been built, and the Capitol University is located on a height overlooking the city on the west.

Government.— The city is governed by a mayor and a council of ten members elected biennially. The chief of police and all other city officers are chosen by the people. The city has electric lighting and owns and operates its own water-works, has several miles of paved streets, large gas plant and work has begun on a street railway.

History.— Guthrie dates its existence from the opening of the territory in 1889, and it was made the capital city one year later, in 1890. The city has had a rapid development and has had a rival in Oklahoma City, about 30 miles south. Pop. (Federal census of 1900) 10,006; (territorial census of 1904) 23,000.

Gut'ta Per'cha, a substance which has been known generally and used in Western countries only since about 1845, though travelers and residents in the East were acquainted with it long before, and had seen various articles made of it, but without knowing the nature of the material. It is the inspissated milky juice of several large trees belonging to the order *Sapotaceæ*, the principal being *Isonandra gutta*, and is obtained by felling the large and old trees, cutting off rings of bark at intervals along the stem, collecting the juice which issues, and concentrating by evaporation, if necessary. The result of this terribly wasteful process is, that the gutta percha tree has been exterminated from various districts in which it was formerly abundant. The tree is found in the Malayan peninsula, and in some of the neighboring islands, in great numbers and of very large size; but if these trees be also cut down, instead of the juice being tapped by incisions (a method which has now come into use), gutta percha will become one of the rarest of substances.

The crude substance is gray or reddish, and is mixed with fragments of bark, leaves, and other impurities, from which it is separated by washing with cold and then with warm water. This softens the gutta percha, and the impurities can be easily picked out. When pure it has a brown color; at the ordinary temperature it is hard and tough, and in not too thick pieces is flexible like leather. It is elastic only to a very slight extent, and cannot be beaten out. It has little or no adhesion for other bodies, but its own cohesiveness is remarkable, a thin strip of it bearing a very considerable weight. When warmed it gradually softens, and then can be drawn into fine fibres, rolled into sheets, or molded. For the latter purpose it is admirably adapted, as when warm and soft it takes the finest impressions, which it retains after it has become cold and hard. When heated to a sufficiently high temperature in the air it catches fire, and burns with a bright flame; heated in close vessels it gives off oily hydrocarbons and an acid liquor, so that gutta percha seems to consist mainly of carbon and hydrogen, with some oxygen, while nitrogen is absent, or present only in very minute quantities. Attempts have been made to resolve gutta percha into

proximate constituents, and accordingly three substances extracted from it have been described. These are named respectively gutta, which is the chief constituent, and when pure is white and opaque; alban, a white oxygenated crystalline substance; and fluavil, also oxygenated, and of a yellow color. These two are said to be formed from the first by oxidation, but there is a considerable diversity of opinion on the nature of these bodies. Ordinary gutta percha is insoluble in water, partially in alcohol and ether, readily and completely in chloroform, turpentine, benzol, bisulphide of carbon, and naphtha. It is also dissolved to a slight extent by oils. It is not attacked by solutions of alkalies, nor by hydrofluoric acid; but it is acted on by sulphuric, nitric, and hydrochloric acids — being darkened in color, oxidized, rendered brittle, or altogether disintegrated — and by chlorine, which transforms it into a white substance like ivory. It is also affected by the oxygen of the air, especially in light, becoming brittle, resinous, and acid; it combines with sulphur and, like caoutchouc, can be vulcanized. Gutta percha is employed for a great variety of purposes, especially for insulating electric wires, being invaluable for submarine telegraph cables because, as a natural insulator of electricity, it is not affected by water, is very pliant, and forms a uniform and close-fitting coating to the wires. It is much prized for making certain kinds of surgical instruments, and in sheets for surgical dressing, and is used for making water-pipes and tubes of various kinds, hose, machine-belting, soles for shoes, golf-balls, overshoes, buckets, picture-frames, and many other articles in general use.

Guy, Thomas, English philanthropist: founder of Guy's Hospital, London: b. about 1645; d. December 1724. His principal income arose from the disreputable purchase of seamen's prize tickets in Queen Anne's war, and from his dealings in South Sea stock in 1720. By these speculations, aided by most penurious habits, he amassed a fortune of nearly half a million pounds sterling, of which he spent upward of $1,000,000 in building and endowing his hospital in Southwark. He also erected almshouses at Tamworth, furnished three wards of St. Thomas' Hospital, and benefited Christ's Hospital and various other charities. He was member of Parliament for Tamworth 1694–1707.

Guy Mannering, a novel by Sir Walter Scott. It was the second of his novels, appearing anonymously in 1815, seven months after 'Waverley.' It is said to have been the result of six weeks' work, and by some critics is thought to show the marks of haste. Its time is the middle of the 18th century, its scene chiefly Scotland. There are fewer than two-score characters in 'Guy Mannering,' and the plot is not very complicated. Meg Merrilies, and Dominie Sampson, the uncouth, honest pedant, are the only great creations it contains.

Guy of Warwick, a metrical romance belonging to that Anglo-Danish cycle from which the Norman trouvères drew so much material. The earliest existing manuscripts of this romance are in French; though it is supposed to have been written by Walter of Exeter, a Cornish Franciscan. It consists of about 12,000 verses, iambic measure, arranged in rhymed couplets.

Guyon, Jeanne-Marie Bouvier de la Motte, zhän mä-rē boo-vē-ā dė lä mŏt gē-ôñ, Madame, French mystic: the introducer in France of the system of Quietism, b. Montargis 13 April 1648; d. Blois 9 June 1717. At the age of 16 she was married to Jacques Guyon, after whose death in 1676 the tendency to mystic enthusiasm which had characterized her younger years again acquired ascendency. She published numerous works, such as 'Le Cantique des Cantiques interprété selon le Sens Mystique' (1685); 'Poésies Spirituelles' (1685); 'Discours Chrétiens et Spirituels' (1716); etc. At last the archbishop of Paris thought it necessary to take steps against the spread of Madame Guyon's mystical doctrines, and through his influence she was shut up in the convent of the Visitation, but afterward released at the instigation of Madame Maintenon, who herself became for a time a convert to the new doctrines, and allowed Madame Guyon to preach in the seminary of St. Cyr, where she made a convert and disciple of Fénelon. A commission of ecclesiastics, chief among whom was Bossuet, now sat in judgment, and the doctrines of Madame Guyon were condemned (1695). This led to her being imprisoned for some years, latterly in the Bastille, whence she was liberated in 1702. The rest of her life was spent in retirement and in works of charity. See Upham, 'Life, Religious Opinions, and Experiences of Madame Guyon' (1870); Guerrier, 'Madame Guyon, sa vie, sa doctrine, son influence' (1881).

Guyot, gē-ō, **Arnold,** American geographer: b. near Neuchâtel, Switzerland, 28 Sept. 1807; d. Princeton, N. J., 8 Feb. 1884. He studied theology at Neuchâtel and Berlin; but later turned his attention to natural science, and in 1835 took the degree of doctor in the University of Berlin. He then went to Paris, where he resided five years, passing the summers in scientific excursions through France, Belgium, Holland, and Italy, examining the characteristic physical features of those countries. In a tour of Switzerland, in 1838, he ascertained and announced in a communication to the Geological Society of France several of the most important laws concerning glaciers. He first discovered the laminated structure of the ice, and showed that the motion of the glacier is due to the displacement of its molecules. These discoveries were fully confirmed and illustrated by the investigations of Agassiz, Forbes, and others. He next investigated the distribution of erratic boulders, in order to solve the question of the mode of their transportation. During seven summers he traced them on both sides of the central Alps, in Switzerland and Italy. Their vertical limits and the laws of their descent were determined by means of more than 3,000 barometrical observations; and the characteristic species of rock of each basin were tracked step by step to their source, often in the midst of the highest regions of ice and snow. A collection of more than 6,000 specimens of rocks was made as vouchers for the results. The full details of these investigations were announced to form the second volume of the 'Système glaciaire' by Agassiz, Guyot, and Desor, the first volume of which was printed in

Paris in 1848; but the political disturbances of that epoch and the removal of Guyot to the United States prevented its publication. The main results, however, are to be found in the 'Bulletin de la Société des Sciences Naturelles de Neuchâtel,' and in D'Archiac's 'Histoire de la Géologie'; and have since passed into various scientific manuals. In the College of Neuchâtel, which numbered Agassiz among its professors, Guyot occupied, from 1839 to 1848, the chair of history and physical geography. In the latter year a political revolution in Neuchâtel broke up the institution, and he was induced by Agassiz to remove to the United States. He resided for several years at Cambridge, Mass., occupying himself with the study of the physical geography of the American continent, and first became extensively known in this country by a course of lectures delivered in Boston in the winter of 1848–9 in the French language, on the relations between physical geography and history. These were translated and afterward collected into a volume entitled 'Earth and Man' (1849). The work had a large circulation in the United States, where it was extensively used as a text-book. For several years Guyot was employed by the Massachusetts board of education to deliver lectures in the normal schools of the State and before teachers' institutes, and in this way, addressing annually 1,200 or 1,500 teachers, he exercised an important influence in reforming the method of teaching geography. From 1855 until his death he was professor of geology and physical geography at Princeton. His meteorological observations, undertaken for the government, were the basis of the present United States weather bureau. Among his further works are 'Treatise on Physical Geography' (1873); 'A Memoir of Agassiz' (1883); and 'Creation, or the Bible Cosmogony in the Light of Modern Science' (1884).

Guyot, Yves, ēv, French publicist: b. Dinan, France, 6 Sept. 1848. He began his studies at Rennes, and early interested himself in social and economic problems of international importance. He took part in the revolution of 4 Sept. 1870, which, after the surrender of Sedan, established the third Republic. He is an ardent reformer, but not a socialist, a free-trader and member of the Cobden Club. In 1885 he was elected to the French Parliament, and in 1889 made minister of public works. He has for years been editor of the *Siècle,* a Liberal paper of a staid, old-fashioned style. He took a prominent part in the defense of Dreyfus, and waged a successful war for the abolition of the continental sugar bounties. Among his writings may be noted 'La Tyrannie Socialiste' (1893); 'Les Principes de '89 et le Socialisme' (1894); 'L'Economie de l'Effort' (1896); 'Le Bilan de l'Eglise' (1901); and 'La Question des Sucres' (1901).

Guzerat, gŭz-ĕ-rät'. See GUJARAT.

Guzman Blanco, Antonio. See BLANCO, ANTONIO GUZMAN.

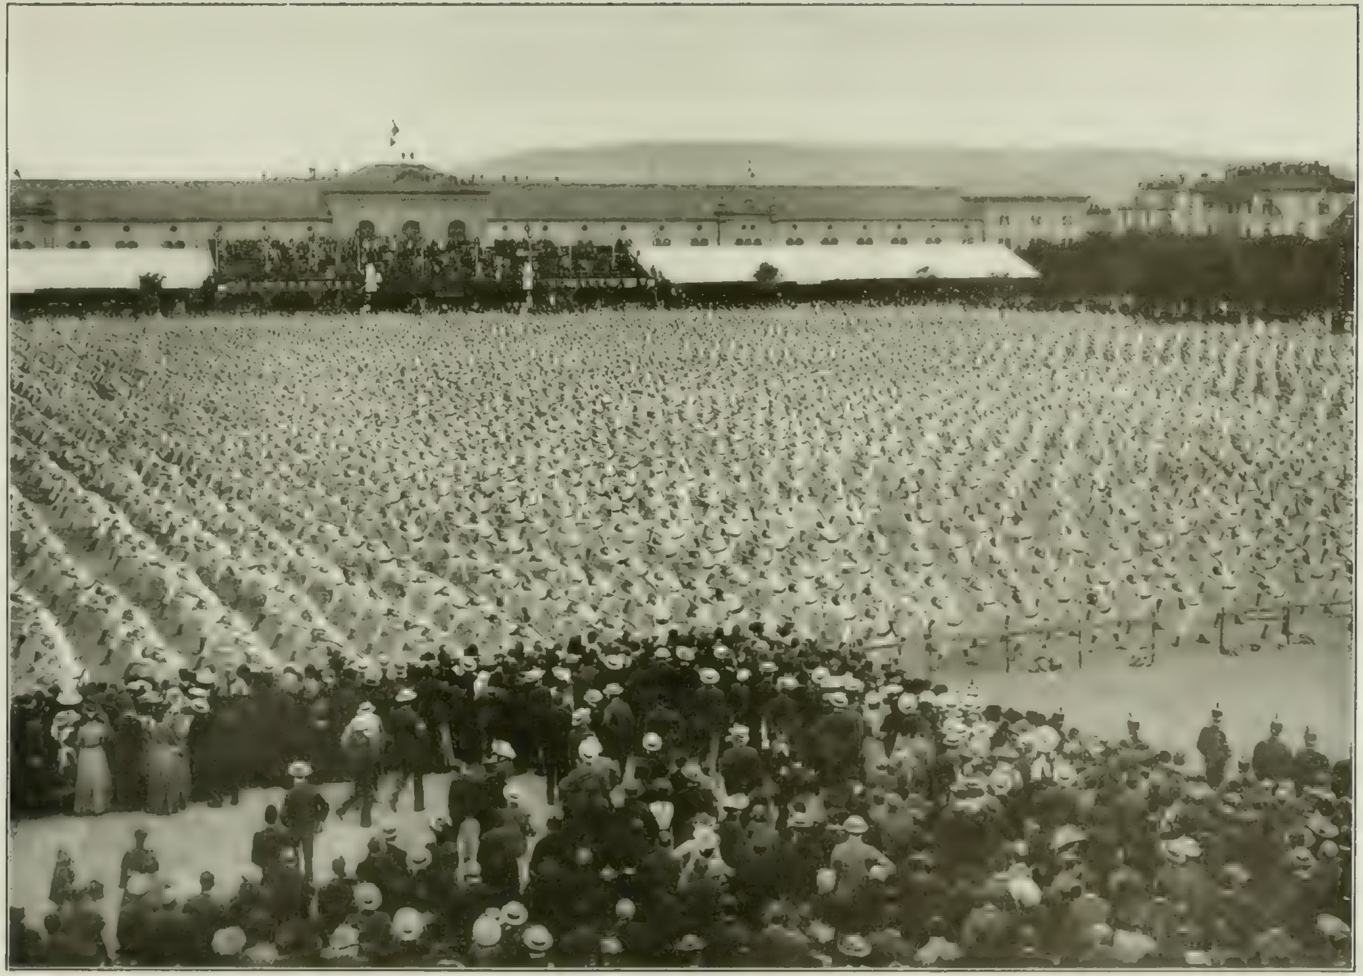
Gwin'nett, Button, American patriot, one of the signers of the Declaration of Independence: b. England about 1732; d. Georgia 27 May 1777. He emigrated from Bristol to America in 1770, purchased a tract of land on St. Catharine's island, Georgia, and devoted himself to agriculture. He became conspicuous in 1775 by his maintenance of the colonial rights, was elected a representative to Congress in Feb. 1776, and re-elected for the following year, and in 1777 became president of the provincial council, the highest station in Georgia. He planned a military expedition against East Florida, which he refused to entrust to his rival Gen. McIntosh, whose official rank entitled him to command it, and which resulted disastrously. This event, aggravated by other disturbances, led to a duel between him and McIntosh, in which he was mortally wounded. See Dwight, 'Lives of the Signers' (1895).

Gwynn, Eleanor, commonly **Nell Gwynn,** English actress: b. Hereford, England, 1650; d. London 1687. She was at first an orange girl, and also gained her bread by singing from tavern to tavern. She became the mistress of Hart and Lacy, the actors, before going in her 16th year upon the stage, where she distinguished herself in light comedy. About 1667 she became the mistress of Lord Buckhurst, who surrendered her to the king. She caused much embarrassment to the Duchess of Portsmouth, who deemed herself too refined for such a rival. It is said that in her elevation she showed her gratitude to Dryden, who had patronized her in her poverty; and, unlike the other mistresses, was faithful to her royal lover. From her are sprung the dukes of St. Albans.

Gymkhana, jĭm-kä'na, a term of Hindu origin, presumably derived from *gend-khana,* that is, ball-house, and associated by Anglo-Indian soldiers and civilians with "gym" or gymnasium, whence its introduction into the English language. It is applied to a building or grounds arranged for athletic recreation, and signifies also the open air meetings for athletic and other mixed sporting events, including horse racing, which are the annual features of almost every military cantonment throughout India.

Gymnastics, History of. The development of gymnastics began in an early period of Grecian and Roman history. Systematic exercise received the stamp of approbation from the most eminent educators of ancient times, and has the endorsement of all teachers to-day. Such exercise has had its periods of decline in popularity, due to the development of professionalism, stimulated by the conferring of extravagant honors and rewards which caused the ranks of the athletes to be filled by a professional class of low extraction, who made their art a trade. But through these periods of decline there have been those who have kept in mind the true value and aim of regularly and systematically conducted exercise; and these advocates have outlived and lived down these evils. So that we find that the scientifically conducted gymnastics have never entirely lost their hold upon educators and those interested in the betterment of mankind.

Modern gymnastics differ considerably from the exercises of the ancients, which at first consisted of athletic feats performed by each individual according to his own notion, and were encouraged among the youth as combining amusement with exercise. They were at length reduced to a system which, in Greece, formed a prominent feature in the state regulations for



SWISS GYMNASTS, AT BERN.

education. In fact the period for gymnastics was equal to the time spent on art and music combined. Public games were consecrated to the gods, and were conducted with the greatest ceremony. The earliest mention we can find of gymnastic sports is in Homer's 'Iliad,' Book II., and again in Book XXIII., when Achilles instituted games in honor of Patroclus, and distributed prizes to the victors for boxing and wrestling. Plato tells us that just before the time of Hippocrates gymnastics were made a part of medical study, because they were suited to counteract the effects of indolence and luxurious feeding, and that at length they became a state matter reduced to a system and superintended by state officers. The first public gymnasia were built by the Lacedæmonians. These were imitated at Athens, where, in one called the Academy, Plato instructed his pupils, and in another, the Lyceum, Aristotle taught. These buildings were superintended by a chief officer. The athletics were in charge of a director, and medical officers were in attendance to prescribe the kind and extent of exercise. Baths were attached to the gymnasia, and a hot bath, followed by a cold plunge, was recommended. Plato and Aristotle considered that no republic could be deemed perfect in which gymnasia, as part of the national establishment, were neglected.

The Spartans were the most rigid in exacting for their youth a gymnastic training; even the girls were expected to be good gymnasts. The exercises for pupils in the gymnasia consisted of a sort of tumbling, war-dances, running — for both sexes — leaping, climbing ropes; of jumping or springing from the knees, with weights attached to the body, maintaining the equilibrium while jumping on slippery skins filled with wine; and of wrestling for the throw. Riding, driving, swimming, rowing, and swinging supplemented the indoor work.

During the Middle Ages the knightly amusement of the tournament absorbed nearly every other sport except foot-racing and wrestling, so that gymnastics fell into disuse till Basedow (q.v.) in 1776, at his institution in Dessau, united bodily exercises with other instruction. This example was followed by Salzmann at his institute and, from this small commencement, the practice gradually extended. In the latter part of the 17th century gymnastics were extensively introduced into Prussian schools by Guts Muths, who wrote several works on the subject. In 1810 the system was still more widely spread by Jahn, who is regarded as the founder of the present Turnverein (q.v.). Prussia at that time was impatient under Napoleonic rule, and Jahn conceived the idea of bringing together the young men for the practice of gymnastic exercises, and, at the same time, indoctrinating them with patriotic sentiments which might be made available to expel the French from Germany. The Prussian government favored the plan, and, in 1811, a public gymnastic school, or Turnplatz, was opened at Berlin, and was quickly imitated all over the country. In 1813 the citizens were called to arms against the French, and Jahn himself commanded a battalion of Lutzow's volunteers. When, however, there was no longer any reason to dread the French, the government of Prussia, regarding the meeting of patriotic young men as a means of spreading liberal ideas, closed the gymnastic schools and Jahn was imprisoned. In other countries, however, the system introduced by Jahn was eminently successful, especially in England, Switzerland, Portugal, and Denmark. It was first introduced into female education under the name of calisthenics when systematic exercises were added to hoop-trundling, skipping-ropes, etc., and to riding, archery, and other healthy outdoor exercises practised among the women.

The masculine sports of cricket, football, quoits, boxing, wrestling, leaping, foot-racing, etc., have been for centuries enjoyed by the boys of England in the playgrounds attached to the schools. In 1848 the political condition of Europe enabled the Turnvereine to be reorganized and the German emigration to the United States has brought these institutions with it. The first society was formed in New York. The organization, as first established, was confined to the practice of bodily exercises; but soon assumed a higher scope. Libraries were collected, schools established, a newspaper ('Turnzeitung') founded; and various arrangements were made for the diffusion of useful knowledge, and for mental culture as well as physical training. Much credit must be given to Ling for his efforts to develop educational gymnastics. He has many followers, and his publication on 'Educational and Curative Gymnastics' has much merit. Ling has been severely criticised by English writers for his claims to originality. They go so far as to say that he simply used the works of authors of his time and of an earlier period, and took his *holus-bonus* from Dr. Francis Fuller in the 'Medicina Gymnastica.' The first edition was published in 1728, and it ran through eight others. It is also claimed that he borrowed in its entirety without acknowledgment, the work of one John Pough, 'A Physiological, Theoretic, and Practical Treatise on the Utility of the Science of Muscular Exercise for Restoring the Power of the Limbs,' with such materials and German gymnastics as had previously found their way through Denmark and Sweden. Through the exertions of such men as Salzmann, Jahn, and others, together with certain English authorities as, Fuller, Pough, Croft, Clias, Thomas and John Graham it was not difficult to establish a system. In fact Salzmann's gymnastics for youth needs only what Pough supplies to give all that Ling calls his system which is only adapted to beginners. The quality of the Ling exercises is stilted, and there is little scope for variety. The fact is, the system sticks too closely to automatic movements, which undoubtedly produce precise and studied monotony in drill.

Turning now to the Dio Lewis period, we see that it marks an epoch in the introduction of an American system of physical training formed in a small measure upon the Swedish and largely upon the German system. This system incorporated free-arm exercises, the use of dumbbells, clubs, rings, wands, together with what was then called the Pangymnastikon, but which was nothing more or less than a pair of flying rings equipped with a pair of detachable stirrups from which swinging, jumping, and stretching exercises were performed. Dio Lewis' work took up the matter of the school-desk, criticised the faulty position of the ordi-

nary desk, and the poor school-room ventilation. In 1861 the Normal Institute for Physical Education was incorporated and located in Boston. Its directors included many of the most distinguished educators of New England, and its departments of anatomy, physiology, and hygiene were in charge of able teachers. Dr. Dio Lewis gave the work in gymnastics. The aim of the institute was and is to furnish competent advocates and teachers of physical training.

Next follows the work of Dr. Sargent, with his American system of gymnastics. Dr. Sargent was born in Maine. He was fond of all kinds of outdoor sports and physical exercise, and joined a gymnasium club while attending high school; but as he had to work out of school hours to support his family, he could only attend to his exercising at odd moments as time permitted. On one occasion he broke a piece of apparatus and was expelled from the club. Piqued and aroused, he improvised an apparatus of his own in a barn. Shortly afterward the club gave a display and, after the members had finished, Sargent and a friend came forward and easily surpassed the athletic feats performed by the others. This event is said to have been the direct cause that led Dudley Sargent to become an ardent physical educator. He was graduated from high school in 1867, was invited to become teacher of gymnastics in Bowdoin College in 1869, and entered the college as a freshman in the regular course and conducted the physical work. In an endeavor to arouse the faculty and the public to the necessity for physical training, he was successful to the extent that, in 1871, gymnastics became a part of the regular curriculum, and Mr. Sargent, though a student only 22 years of age, was placed at the head of the department, and filled the position with credit. About this time he brought out his system of chest-weights. In 1872 he accepted a position as director of the Yale College gymnasium, and for three years had charge of both Yale and Bowdoin, spending part time in each place. It was while at Yale that he fully developed the "individual apparatus" for which he is so well known. At the solicitation of friends he went to New York and started a gymnasium on Fifth Avenue, which at once sprang into popularity. In 1879 he accepted the appointment of director of the Hemenway Gymnasium and assistant professor of physical training at Harvard University. This promotion of the department of physical training to a rank equal to the scholastic departments of the university was a great stride forward, and stamped the new system with the mark of public approval. To Dr. Sargent is the credit due for the invention of the chest-weight, the intercostal machine, quarter-circles, leg and finger machine, and other appliances to the number of 30 or more. He also elaborated a system of anthropometric measurements which enable an examiner to ascertain at once the physical condition of a student, and which guided a director in prescribing proper exercises for the development of deficient parts. Dr. Sargent believes in special work for individuals, and will not allow a man or woman to go into the gymnasium and take the drills and work with the apparatus indiscriminately. Health, harmony, and symmetry are the results aimed at.

About the same time, physical training was taken up by and introduced into the Young Men's Christian Association, whose local gymnasia have done much to give the work a moral tone. We owe a great deal to such men as R. J. Roberts of Boston, whose name has been associated with the advancement of physical education since 1875, and whose dumb-bell drill and book of exercises has long been a standard in the association's work. The organization of the physical work under the auspices of the Y. M. C. A.'s has been practically responsible for the systematization of the American system of gymnastics, and for the establishment of a universal nomenclature of gymnastics. Among those who have done most for physical training along educational lines, I would mention Dr. Hartwell of Boston, Dr. Gulick of New York, and Dr. Seaver of Yale.

To-day, practically, all private schools have a well-equipped gymnasium under the direction of a man who has had special training in the application of exercise, the theory and practice of gymnastics, and who is, in many cases, a medical graduate. Systematic progressive courses of work are conducted, which aim to develop and strengthen, to give co-ordination and grace, and to make the individual self-reliant and resourceful. The equipment required to obtain this result is necessarily extensive, consisting of a gymnasium, say 50 x 100 feet, with clear floor space, high-vaulted roof, a fine system of ventilation, and with every variety of apparatus which the ingenuity of the specialists, and the energy and resourcefulness of the manufacturers, can provide. The equipment consists of light apparatus — dumb-bells, Indian clubs, bar-bells, wands; heavy apparatus — German horse, parallel bars (suspended and floor), horizontal bars (high and low), buck, flying rings, traveling rings, horizontal and vertical ladder, climbing ropes, rope ladders, spring-boards beat-boards, floor-mats, wrestling and tumbling mats, Swedish stahl bars, booms, serpentine ladder, and balance-beams; as well as special apparatus — chest-weights, intercostals, quarter-circle, chest-expander, traveling parallels, wrist-machine, long inclined plane, sculling-machine, paddling-machine, leg-machine, neck-machine, bicycle-trainer, and so on through an almost endless variety. No plant is complete without its swimming-tank, varying in size from 15 x 45 up; its shower-baths, needle-baths, tub-baths; and some have steam-rooms and massage-tables. An indoor running track is an almost indispensable adjunct to all well-equipped gymnasia; and there should also be the equipment for indoor athletics during the winter months. Provision for indoor games is also essential — basket-ball, baseball, and ring-hockey. Each school has adjacent athletic grounds with tennis-courts, quarter-mile track, football and baseball fields, and golf course. See Physical Culture.

The college physical departments surpass those of the preparatory schools only in size and extent of equipment. Harvard University probably excels all others in point of variety of equipment for special work. The summer work in the public parks and school playgrounds must also be noted. These out-of-door gymnasia are equipped with extensive apparatus for all outdoor work. Preparatory school work in gym-

nastics is, by general consent, made to consist of a system of corrective, body-building exercises, made up of free-arm work and light calisthenics in the lower grades, followed by heavier calisthenics, dumb-bells, clubs and wands, light apparatus, intermediate and advanced apparatus, boxing, wrestling, and fencing, interspersed with periods for recreative games, competitions, and contests of skill and strength.

J. Martin Voorhees,
Director of Gymnasium, Pratt Institute, Brooklyn, N. Y.

Gymnophiona, jĭm-nō-fī'ō-na. See Cæcilians.

Gymnosperm, jĭm'nō-spėrm, a plant with a naked seed. Among the gymnosperms are the cycads, gingkos, conifers, and *Genetaceæ*. The last group is represented by a single extraordinary tree or plant of West Africa (*Welwitschia mirabilis*), the stem of which, looking like a huge wood-fungus, may, when mature, be a little over a foot high but several feet across. It bears but two leaves, the cotyledons, which sometimes grow to be 5 or 6 feet long and 2 or 3 feet wide, ultimately splitting into strips. The plant is said to live over 100 years.

Gymnotus, jĭm-nō'tŭs. See Electric Fishes.

Gynæcology, in medicine and surgery, the science which treats of the physical organization of women and of the diseases peculiar to them.

Gyp, pseudonym of Sibylle Gabrielle Marie Antoinette de Riquetti de Mirabeau, Comtesse de Martel de Janville. See Martel de Janville.

Gypsophila, jĭp-sŏf'ĭ-la (Baby's Breath). A genus of European and Asiatic annual and perennial herbs of the natural order *Caryophyllaceæ*. They are highly valued and widely planted for their small flowers which, being upon branchy stems, give a pleasing effect to bouquets and a mist-like grace to flower-borders. They are of simplest culture upon somewhat dry soils, especially among rocks and in sunny situations. The perennial species are hardy. Six or more species and a few varieties are cultivated in American gardens and greenhouses.

Gyp'sum, a native hydrated sulphate of calcium, having the formula $CaSO_4 + 2H_2O$; the water of crystallization being the only thing that differentiates it, chemically, from the orthorhombic mineral anhydrite. Gypsum is usually colorless or white. It crystallizes in the monoclinic system, contact twins and penetration twins being very common; and it also occurs in massive forms. The pure crystals have a hardness of from 1.5 to 2.0, and a specific gravity of about 2.32. Gypsum is an exceedingly abundant substance, and is met with in many parts of the earth, and in a variety of forms. When found in the form of clear, transparent crystals, it is known as selenite; when the mineral is finely fibrous, and the fibres are parallel to one another so as to form a mass with a pearly opalescence, the mineral is called satin spar; when it occurs in uniform, fine-grained, translucent masses, it is known as alabaster; and when it occurs in large beds of massive rock, often mixed with clay, calcium carbonate, and other impurities, it constitutes the earthy gypsum, or rock gypsum, of commerce. Gypsum is soluble in from 400 to 500 parts of water at ordinary temperatures, but it dissolves more freely in hydrochloric acid. When heated, it loses part of its water of crystallization, though it retains the power of recombining with water to form a hard, non-crystalline mass, if the temperature to which it is exposed does not exceed 500° F. It is this property of recombining with water, which gives to dehydrated gypsum much of its industrial value. (See Plaster of Paris.) When heated with charcoal, gypsum is converted into calcium sulphide, which dissolves readily in dilute acids, with evolution of sulphuretted hydrogen gas. In this way the sparingly soluble sulphate of calcium may be converted into the soluble chloride or nitrate of calcium. Gypsum, when pulverized, is used as a fertilizer, its efficiency in this respect being apparently due in large measure to the fact that it facilitates the decomposition of rocks containing alkaline silicates.

The production of gypsum in the United States, in 1901, was 1,246,649 short tons, valued at $1,577,493. Texas, Michigan, New York, and Iowa were the principal producing States. The United States ranks second in the world's production of gypsum, France being first, and Canada third.

Gypsy. See Gipsies.

Gyra'tion, Radius of. The energy required to set a body in rotation in any given manner depends on the arrangement of the mass of matter to be rotated. Thus, a mass made into a ring like a wheel with very light spokes requires the expenditure of more energy in order to set it to rotate once per second on its axis than would be required if the same amount of matter were made into a uniform circular plate of the same radius. The energy required to set any given body in rotation about any given axis depends, in fact, on the "moment of inertia" of the given body about that axis; and the mass of the body being given, the moment of inertia depends on the way in which the mass is disposed about the axis of rotation. The radius of gyration about a given axis is the distance from that axis at which the whole of the matter of the given body might be concentrated without altering the moment of inertia. The moment of inertia and radius of gyration for any given body about any given axis may be calculated mathematically. The two magnitudes are evidently of great importance in the theory of rotating bodies.

Gyrfalcon, jẽr'fä"kĕn. See JERFALCON.

Gyroscope, jī'rō-scōp, an instrument invented by Foucault to show the rotation of the earth on its axis. It consists essentially of a metallic disk capable of being set in very rapid rotation. The disk is supported in a ring, the axis of rotation being a diameter of the ring, and is pivoted so as to rotate with the smallest possible amount of friction. A disk in rapid rotation tends to keep the axis of rotation always pointing in the same direction; and if the ring described above be held in the hands, it will be found that though it may be carried about from place to place in any way, so long as no attempt is made to change the direction of the axis of rotation, any motion whatever which tends to alter the direction of that line meets with extraordinary resistance.

H

H the eighth letter of the English and other alphabets derived from the alphabet of the Latins. It was borrowed by the Latins from the alphabet of the Greeks, and in early Greek represented an aspirate consonant sound, but in the Greek of classical times it stands for the prolonged vowel sound of *e*, as omega (ω) stands for the prolonged sound of omicron (ο). The H is evidently a character borrowed from the Phœnician alphabet, where its form was 𐤇 and its sound guttural aspirate, like that of the corresponding Hebrew letter *cheth* or like *ch* in German and in Scotch. In Greek, after H was adopted as a vowel sign, the aspirate was represented by ʻ or ʽ either prefixed to a letter (ʽο) or written above it (ὁ): it was previous to this change that H was introduced into the Latin alphabet. It is probable that in early Latin this letter, occurring between two vowels, as in *nihil, mihi, traho, veho,* represented a guttural sound, as the *h* in *nihil* and *mihi* does still in the Italian pronunciation of Latin. But evidence exists that in the classical usage of ancient Latin speech initial *h* was of little account and was "silent" as in modern Italian and French: this is certain as regards the pronunciation of the vulgar; and that even the educated often "dropped the h's" we know from the fact that in ancient monuments we find Hannibal and Annibal, Hadria and Adria, herus and erus, haruspex and aruspex.

In Anglo-Saxon and earliest English speech *h* represents a guttural aspirate like German and Scotch *ch* in *ach, loch;* for example, in *niht* (night), *thoht* (thought) the *h* stood for the same sound as *ch* in the German words *nacht, gedacht.* In earliest English speech *h* was prefixed to *l, n,* and *r,* to represent a gutteral aspirate which is now entirely lost; examples, *hlaf* (loaf), *hnecca* (neck), *hring* (ring): the initial guttural in such words has been dropped, as in the names of the early Frankish kings Hlodowig became Ludovicus and Louis, and Hlothar became Lothair. The original guttural *h* in old High German *hros* is completely eliminated in the modern German *ross,* but is represented by the aspirate *h* in Old English *hors* (horse). The *h* after *w* in many words as wharf, what, when, etc., represents an initial aspirate in Old English hwarf, hwaet, hwaenne, etc.

H is added to various consonants to form digraphs for representation of various sounds, for example, *ch* as in chin, *sh* as in shy, *gh* as in gherkin, *th* as in thin, then; or even to represent sounds for which there is already a proper consonant in the alphabet, for example *ph* and *gh* for the sound of *f* (philter, rough), *ch* for the sound of *k* (chyle); in very many cases the digraph *gh* is employed simply as a memorial of an ancient etymology, as in plough, and not seldom for no discernible purpose at all, as in ghost; the form *rh* usually occurs in words of Greek origin, and recalls the Greek etymology (rhapsody), but again it is employed to suggest false Greek etymology (rhyme).

H. H. See Jackson, Helen Maria Fiske Hunt.

Haarlem, här'lĕm, Holland, the capital of the province of North Holland, 11 miles by rail west of Amsterdam, and five miles from the North Sea. The city is intersected by canals bordered by tree-lined avenues, and communicates with the Zuyder Zee by the Spaarne and the Ij. Its chief municipal building is the town hall, a 17th century palace of the counts of Holland, containing a library, art, and historical collections. In Haarlem wood a favorite pleasure resort is the Pavilion housing the Society for the Promotion of Industry, and containing the colonial and industrial museums. Chief among numerous educational institutions is the Teyler Museum, for the study of theology, natural science, and the fine arts. The finest ecclesiastical structure is St. Bavo's or the Groote Kerk, a 15th century late Gothic basilica, one of the largest churches in Holland, noted for its tower 260 feet high, and its large organ. Haarlem was important commercially as early as the 12th century, and although its manufacturing industries have declined, has cotton-mills, linen bleacheries, type foundries, breweries, etc. The town suffered during the revolt of the peasantry in 1492 and was deprived of its privileges by Albert of Saxony. During the war of independence it sustained a siege of seven months (1572–73) by the Spaniards, and capitulated only after a display of the noblest heroism and courage. It was retaken by the Prince of Orange in 1677. Pop. (1899) 64,069.

Haas, häs, **Johannes Hubertus Leonardus de,** Dutch painter: b. Hedel, North Brabant, 23 March 1832. A pupil of Jan van Os at Haarlem, he established his studio at Brussels in 1857, and attained an excellent reputation by his finely-colored animal studies and animal groups with background of Dutch landscape. In 1869 he received a gold medal at Munich for his 'Trio of Donkeys.' Others of his works are: 'The Three Comrades'; 'In the Dunes'; 'On the Bank of the Yssel'; 'Cattle at Pasture.'

Habakkuk, ha-băk'ŭk or hăb'a-kuk, the eighth of the twelve minor prophets. He was

of the tribe of Levi, and flourished about 600 B.C. His prophecy commences with a lamentation for the corruption and social disorganization which the prophet sees around him. He cries to God for help, and is answered by threatenings of swift vengeance. The prophet is commanded to write the vision of God's retributive justice as revealed to his prophetic eye. The doom of the Chaldæans is first told in general terms and the announcement is followed by a series of denunciations pronounced upon them by the nations whom they had oppressed. The whole concludes with a magnificent psalm (chap. iii.), 'Habakkuk's Pindaric Ode,' as it is called by Ewald, a composition unrivaled for boldness, sublimity, and majesty of diction.

Hab'berton, John, American author: b. Brooklyn, N. Y., 24 Feb. 1842. At first a printer he subsequently served in the Federal army, and later undertook editorial work in New York. His best-known book, 'Helen's Babies' (1876), attained great popularity both in America and in Europe. He has published also 'The Barton Experiment' (1877); 'Other People's Children' (1877); 'The Worst Boy in Town' (1880); 'Who was Paul Grayson?' (1881); a humorous 'Life of Washington' (1883); 'One Tramp' (1884); 'Brueton's Bayou' (1886); 'The Chautauquans' (1891); 'A Lonely Lover' (1893); 'The Tiger and the Insect' (1902); 'The Bowsham Puzzle'; 'Country Luck'; 'Little Guzzy'; 'Caleb Wright'; etc.

Habeas Corpus, hā'bē-as kôr'pŭs, an ancient English writ addressed to him who has another in custody, and commanding him to produce the body of the person named at a certain place and time. One of the purposes for which it was used was to recover freedom when wrongfully taken away. Personal liberty was asserted by the common law from its earliest ages, and it was always assailed by kings who would be absolute, and with an earnestness proportionate to their tyranny. Hence it became imperatively necessary, if subjects were to retain the control and disposition of their own persons, that they should demand a recognition of this principle from their sovereign, and in England the principle was declared in the most solemn manner in Magna Charta. It is there said that "no man shall be taken or imprisoned but by the lawful judgment of his peers, or by the law of the land." It became necessary, however, in the course of time to put down the abuses by which the government's lust of power, and the servile subtlety of crown lawyers, had impaired so fundamental a privilege; and this was effected by the Habeas Corpus Act passed in 31 Charles II. (1679). Of the political and social effects of this measure Blackstone writes: "If once it were left in the power of any, the highest magistrate, to imprison arbitrarily whomever he or his officers thought proper, there would soon be an end of all other rights and immunities."

The provisions of the act may be stated generally thus: (1) That on complaint or request in writing, by, or on behalf of, any person committed and charged with any crime (unless committed for treason or felony expressed in the warrant; or as, or on suspicion of being accessory before the fact to any felony, or upon suspicion thereof, plainly expressed in the warrant; or unless committed or charged in execution by legal process), the lord-chancellor, or any of the judges in vacation, upon viewing a copy of the warrant or affidavit that a copy is denied, shall (unless the party has neglected for two terms to apply to any court for his enlargement) award a habeas corpus for such prisoner, returnable immediately before himself, or any of the judges; and upon the return made shall discharge the party, if bailable, upon security being given to appear and answer to the accusation. (2) The writ shall be returned, and the prisoner brought up within a limited time, according to the distance, not exceeding 20 days. (3) Officers and keepers neglecting to make due returns, or not delivering to the prisoner, or his agent, within six hours after demand, a copy of the warrant of commitment, or shifting the custody of a prisoner from one to another, without sufficient reason or authority (specified in the act), shall for the first offence forfeit £100; for the second £200, to the party grieved, and be disabled to hold their office. (4) No person once delivered by habeas corpus shall be recommitted for the same offence, on penalty of £500. (5) Every person committed for treason or felony may insist on being tried at the next assizes, or admitted to bail, unless the crown witnesses cannot be ready in that time; and if not tried at the second assizes or sessions, he shall be discharged from the imprisonment. (6) The prisoner may apply either to the Court of Chancery, or to the Courts of Queen's Bench, Common Pleas, or Exchequer, and any judge denying such writ is liable to a fine of £500. As the Habeas Corpus Act extended only to cases where persons are imprisoned on criminal, or supposed criminal charges, the other cases being left to the operation of the common law, which was found defective, the statute 56 George III. was passed, which extended the writ to other cases. Under this last act any person confined, or restrained of his liberty (otherwise than for criminal matters, and except persons imprisoned under a judgment or decree for debt), may apply to any judge of the common law courts for a habeas corpus, on showing by affidavit that there is a reasonable and probable ground for complaint.

In times of great political excitement, and suspected treasonable conspiracies, the operation of the Habeas Corpus Act has been suspended, as in Ireland in 1866, by 29 Vict. But such suspension does not enable any one to imprison without cause or valid pretext for so doing. It only prevents persons who are committed from being bailed, tried, or discharged during the suspension, leaving to the committing magistrate all the responsibility attending on illegal imprisonment. It is not uncommon therefore to pass an act of indemnity subsequently, for the protection of those who either could not defend themselves in an action of false imprisonment, without making improper disclosures of the information on which they acted, or who have done acts not strictly defensible at law, yet apparently justified by the necessity of the moment. The English statute has been copied in the United States without essential change.

In the Constitution of the United States it is provided that "the privileges of the writ

of habeas corpus shall not be suspended unless when, in cases of rebellion or invasion, the public safety may require it." The scope of this provision came under discussion during the Civil War when the President of the United States authorized Lieut.-Gen. Scott, where in his judgment it seemed necessary, to suspend the writ. When on one occasion the general refused to obey the writ, Chief Justice Taney, who had issued it, uttered an opinion in which he declared that it was only in the power of Congress, and not of the President, to proclaim such suspension, a view which legal authorities seem inclined to agree with.

It has been decided by the Supreme Court, in view of possible conflicts of jurisdiction between State and Federal courts, that no State judge has a right to issue a writ of habeas corpus for the release of a person held under the authority of the Federal government. On the other hand the United States courts are more restricted in the power to issue such writs than the State courts. A Federal court may issue a writ of habeas corpus in cases coming within Federal jurisdiction. The circuit court may decide whether the person ought to be discharged, but cannot do this even in cases where the writ has been suspended. There are also several provisions made by which an imprisoned person, whose testimony in a court of law is required, may be released by a writ of habeas corpus in order to appear before the judge. The Supreme Court has not the power to issue this writ, excepting in response to an appeal. Consult: Blackstone, 'Commentaries'; Hurd, 'Habeas Corpus.'

Haberstich, Samuel. See BITTER, ARTHUR.

Hack'berry, an American tree of the elm family and genus *Celtis*, growing in dry woods throughout the eastern United States and Canada. It is small or middle-sized, with the aspect of an elm. The fruit (a globular drupe) is sweet and edible, as large as the bird-cherry, and ripening in autumn. Two species exist.— *C. occidentalis*, the northern hackberry, sugar-berry or nettle-tree; and a southern one (*C. mississippiensis*). The soft, coarse-grained yellow wood is of little value. It is affected by the same insects as injure the elm (q.v.).

Häckel, Ernst H. See HAECKEL.

Hack'ensack, N. J., city, county-seat of Bergen County, on the Hackensack River, and on the New York, S. & W., and Erie R.R.'s, 16 miles from New York. It is a residential city, but has brick, silk, and other manufacturing interests. It has a public library, high school, gas and electric light, waterworks, electric street railways connecting with surrounding towns and cities and with New York, and an assessed property valuation of over $5,000,000. Hackensack was settled by the Dutch in the latter part of the 17th century, and during the Revolution was occupied in turn by the British and American armies. Pop. (1900) 9,443.

Hacker, Arthur, English artist: b. London 25 Sept. 1858. He studied at St. John's College, London, was a pupil in art of the Royal Academy and of Léon Bonnet at Paris (1880–1), set up his studio in London, and painted, besides several portraits: 'Pelagia and Philammon'; 'By the Waters of Babylon'; 'Væ Victis'; 'Syrinx'; 'Sir Percival'; and other works.

Hack'ett, Horatio Balch, American Baptist clergyman and educator: b. Salisbury, Mass., 27 Dec. 1808; d. Rochester, N. Y., 2 Nov. 1875. He was professor of biblical literature at Newton (Mass.) Theological Seminary 1839–70, and of Greek at Rochester Theological Seminary, from the latter date. He was one of the committee of New Testament revision, and with Ezra Abbot (q.v.) edited the American edition of Smith's 'Bible Dictionary' (1868–70). His chief work was a 'Commentary on Acts' (1851); and he also wrote 'Memorials of Christian Men in the War' (1864); 'Tour in the Holy Land' (1866); etc.

Hackett, James Henry, American actor: b. New York 15 March 1800; d. Jamaica, L. I., 28 Dec. 1871. He went on the stage in 1826 and was particularly successful in impersonating Yankees and Westerners, but was best known by his Falstaff, which he played first about 1832. He was widely popular in the United States as well as in England. He published 'Notes and Comments on Shakespeare' (1863).

Hackett, James Keteltas, American actor: b. Wolfe Island, Ontario, Can., 6 Sept. 1869. He is the son of J. H. Hackett (q.v.). He was graduated from the College of the City of New York in 1891, made his début in 1892, became leading man of the Lyceum, New York, in 1896, and appeared in 'The Prisoner of Zenda,' 'Rupert of Hentzau,' 'The Pride of Jennico,' 'Don Cæsar's Return,' and 'The Crisis.'

Hackettstown, N. J., town in Warren County; on the Musconetcong River and on the Delaware, L. & W. railroad and the Morris Canal; about 59 miles from New York city, and 50 miles west of Newark. It is about 800 feet above the sea and within half a mile of the highest point in the State. Its chief manufactures are silk goods, carriages and wagons, and agricultural implements. The waterworks are owned and operated by the town, and the supply comes from springs on Schooley's Mountain, distant from the town about two and one half miles. It is the seat of the Centenary Collegiate Institute, under the auspices of the Methodist Episcopal Conference of Newark. Pop. (1900) 2,427.

Hackländer, Friedrich Wilhelm von, frēd'rĭн vil'hĕlm fōn häk'lĕn-dĕr, German novelist and writer of comedies: b. Burtscheid, near Aix-la-Chapelle, Prussia, 1 Nov. 1816; d. Leoni, near Munich, 6 July 1877. After serving for a time in the Prussian artillery he began a literary career with 'Pictures of Soldier Life' (1841), followed by 'Soldier Life in Peace' (1844). Other works of this period were 'Daguerreotypes' (1842); and 'Pilgrimage to Mecca.' In 1849 he went to Italy, where he was present with Radetzky's army during the campaign in Piedmont, and afterward published 'Soldier Life in War' (1849–50). Among the best of his longer novels are 'Trade and Traffic'; 'Eugene Stillfried' (1852); and 'Anonymous Histories' (1851). His best comedies are the 'Secret Agent' (1850), translated into several European languages, and 'Magnetic Cures' (1851). With Zoller, in 1885, he started the illustrated weekly 'Over Land and Sea.'

Hackley, Charles Henry, American capitalist: b. Michigan City, Ind., 3 Jan. 1837; d. Muskegon, Mich., 10 Feb. 1905. In 1856 he

went to Muskegon, Mich., and worked in a lumber-mill as laborer and foreman; then attended a commercial school and was given a position as bookkeeper and later came to be partner with a mill firm. In 1880 he founded the firm of which he is the head, which is one of the most important in the State, and he has also been interested in many other industries. He has been a member of the board of education, and was elected regent of the University of Michigan, but declined the office. He has made large gifts to the city of Muskegon. In 1888 he gave a public library, which he endowed in 1891; in 1889 he had a park made in a central part of the city in which he erected a soldiers' and sailors' monument and other statues; in 1891 he built and endowed a manual training school; in 1901, he provided for the erection of a hospital with a training school for nurses, and erected a statue of McKinley, the first statue of the late President to be unveiled. The total value of his gifts is $1,389,525.

Hackmatack, hăk'ma-tăk, the American larch. See LARCH.

Hackney, England, a metropolitan borough in the northeast of London, three miles north-northeast of St. Paul's. It has a fine modern town hall. Hackney was formerly noted for its boarding-schools for young ladies. It is supposed that hackney-coaches were first established between this place and London, and derived their name from it. It has manufactories of chemicals, india rubber, etc.; and had formerly extensive silk-mills. Pop. (1901) 270,535.

Hackney Carriage or **Coach**, a four-wheeled enclosed vehicle drawn by two horses and seating four persons exclusive of the driver. They are usually let out for hire. The carriage derives its name from Hackney (q.v.).

Haddam, Conn., a town and one of the county-seats of Middlesex County, 26 miles southeast of Hartford, on the New York, New Haven & Hartford R.R., and on the west bank of the Connecticut River, 29 miles above its mouth. Among its educational institutions is Brainerd Academy. It has important granite quarries, lumber and saw-mills, and a paper mill. Pop. (1900) 2,015.

Haddock, a fish (*Melanogrammus æglefinus*) of the same family (*Gadidæ*) as the cod, and much resembling it in general appearance. From the cod it may be easily distinguished by the black lateral line and suprapectoral blotches, and the swollen bones of the shoulder girdle. The haddock scarcely exceeds a weight of 15 pounds, and is usually about 3 or 4 pounds. It is restricted in its range to the North Atlantic. The food is extremely varied, consisting of every kind of bottom-living invertebrate. Spawning occurs in late winter and early spring, according to locality, and the eggs are essentially like those of the cod. Haddock associate with cod on the Banks, but the principal American fisheries are in Massachusetts Bay, on the Nantucket shoals and other points off southeastern New England, where immense numbers are taken on trawl and hand lines, especially during the summer. Philadelphia and Boston furnish the best markets for fresh haddock, but the demand from the interior is constantly growing. Though considerable quantities are salted at Provincetown, the haddock when so prepared is much inferior to the cod. The Scotch method of drying and smoking produces the much superior «Finnan Haddies,» and is largely practised at Portland and Boston.

Had'don Hall, an old English baronial mansion, the seat successively of Avenells, Vernons, and the Rutland family, stands on a slope overlooking the Wye in Derbyshire, 23 miles north-northwest of Derby. The styles of architecture range from Norman to the 16th century. Reference is made to it in Scott's 'Peveril of the Peak.' Although it is not inhabited it is in fine condition and remarkable as one of the most interesting extant examples of the country house of a great land owner in the late Middle Ages.

Haddonfield, N. J., a borough of Camden County, five miles southeast of Camden, a junction of two branches of the Camden and Atlantic railroad. Its industries are mainly agricultural; and it has also manufactures of stoves, tinware, watchcases, etc. Pop. (1900) 2,776.

Ha'den, SIR **Francis Seymour**, English etcher and surgeon: b. London 16 Sept. 1818. He studied at the Sorbonne and in the Paris and Grenoble medical schools, and in 1857 became a Fellow of the Royal College of Surgeons. The 'Etched Work of F. S. Haden' contains 185 plates by him and still others have been published in 'Études à l'Eau Forte' (1865–6). His work as an etcher is noted for both vigor and breadth. He is president of the Society of Painter Etchers, was knighted in 1894, and has written 'Rembrandt True and False'; 'Etched Work of Rembrandt' (1879–80); 'Lectures'; 'About Etching' (1881).

Hades, hā'dēz, the Greek name of a god, in large measure corresponding to the Roman Pluto, who reigned over the infernal regions. Both Greeks and Romans supposed the infernal regions to be in the centre of the earth. To enter these, the river Styx had to be crossed by the dead in the wherry of Charon. If, by any chance, the body lay unburied, the shade was detained 100 years on the banks of the Styx before crossing.

The Greek word Hades is rendered in the authorized version by the ambiguous term hell (q.v.). Expressions, most of them obviously figurative, used of Hades, represent it as subterranean; as having gates with keys in the hand of Christ, and as having, in a portion of it, souls in torment.

Had'is, or in Arabic plural, AHADIS, narrations or traditions, which relate to the Prophet Mohammed, and are not found in the Koran. There are numerous collections of these floating traditions, anecdotes and legends. A search for such data was first undertaken by Abdul Malik ibn Juraisch (d. 772 A.D.). Others consider that the collection of Imam Malik (d. 801) is the earliest extant. The following six Hadis collections are considered by the Sunnite Moslems to be canonical scriptures: 1. The Hadis of Mohammed Ismail al Buchari (d. 878). 2. Of Muslim ibn ul Hajaj (d. 883). 3. Of Abu Isa Mohammed al Tirmisi (d. 901). 4. Abu Daud al Sajistani (d. 897). 5. Of Abu Abd ur Rahmân al Nasâi (d. 925). 6. Of Abu Abdallah Mohammed Ibn Wajah (d. 895). None of these have ever been printed.

ARTHUR TWINING HADLEY,

PRESIDENT YALE UNIVERSITY.

Hadley, Arthur Twining, American college president: b. New Haven, Conn., 23 April 1856. A son of James Hadley (q.v.), he was graduated from Yale in 1876, and took graduate studies in political science at Yale and the University of Berlin. In 1879–83 he was a tutor at Yale, and during that time wrote for several journals, including the 'Railway Gazette' and the 'Financial Chronicle.' He was commissioner of labor statistics for Connecticut (1885–7), and was in 1885 a witness before the Cullom State committee which prepared the Interstate Commerce Law. In 1886 he became professor of political science at Yale, and in 1899 was made president of the university. He was president of the American Economic Association for two years. In 1885 he published 'Railroad Transportation: Its History and Laws,' which is everywhere recognized as one of the chief authorities on the subject, and has been translated into French and Russian; his other works include 'Report on the Labor Question' (1885); 'Economics, an Account of the Relations between Private Property and Public Welfare' (1896), presenting the theories of political economy in accordance with the most modern research and thought; and 'The Education of the American Citizen' (1901). His writings show him to be not only a scholar, but also a man of affairs well acquainted with the business world, and in this regard he is one of the best representatives of the modern type of university presidents.

Hadley, Henry K., American composer: b. Somerville, Mass., 1871. He was a pupil of S. A. Emery and G. W. Chadwick in Boston, studied also in Vienna, and in 1895 returned to the United States and was appointed instructor in music at St. Paul's School, Garden City, L. I. His symphony, 'The Four Seasons,' received the prizes given by the Paderewski Fund and the New England Conservatory of Boston. His works further include a concert overture 'Hector and Andromache'; a symphony, 'Youth and Life'; a cantata, 'In Music's Praise'; a festival march; trios, quartettes, and more than 150 excellent songs and pianoforte compositions.

Hadley, James, American philologist: b. Fairfield, N. Y., 30 March 1821; d. New Haven, Conn., 14 Nov. 1872. When a boy he suffered an injury to his knee, which developed seriously, and crippled him for life. He was graduated from Yale in 1842, took graduate studies in mathematics and also a theological course. In 1844 he was tutor at Middlebury College, Vt., and in 1845 became a tutor at Yale. In 1848 he became assistant professor of Greek there, and in 1851, professor of Greek. He was familiar not only with Greek, Latin, and the chief modern languages, but also with Hebrew, Arabic, Armenian, Gaelic, Irish, Sanskrit, Gothic, and Old English, and won a high reputation as a linguist distinguished for exactness and thoroughness in detail, united with breadth of view; he also was successful and influential as a teacher. He published a 'Greek Grammar' (1861), based on Curtius, and wrote the 'Brief History of the English Language' in the 1864 edition of Webster's 'Dictionary'; after his death, his 'Introduction to Roman Law' (1873) and 'Philological and Critical Essays' (1873) were published.

Hadley, John, English mathematician and astronomer: b. 1682; d. 14 Feb. 1743. He became a Fellow of the Royal Society in 1717, and was the inventor of Hadley's quadrant (see SEXTANT) and of a reflecting telescope (1723). The credit of having invented the sextant is claimed for Hadley, Godfrey, and Newton, but each seems, nevertheless, to have made his own discovery independently. Hadley described his instrument, which he called an "octant," to the Royal Society in May 1731.

Hadley, Mass., town, which includes several villages, in Hampshire County; on the Connecticut River and on the Boston & M. Railroad; three miles northeast of Northampton and four miles southwest of Amherst. It was settled in 1659, and was first called Norwottack; but in 1661, when it was incorporated, it was given the name Hadley, from Hadley in England. William Goffe and his father-in-law Whalley, who fled from England to America in 1660, and who lived for a time near New Haven, sought concealment in Hadley, in 1664, where Goffe died in 1679. According to tradition, when Hadley was at one time attacked by Indians, and the people were called from the meeting-house, they stood helpless until Goffe appearing, took the lead and repelled the enemy. Hadley is an agricultural region, and its industries are chiefly connected with farm products. Pop. (1900) 1,789.

Hadramaut, hä-drä-mât', Arabia, the name given to the coast region from Aden to Cape Ras-al-Hadd. It consists of a plateau, parted from a mountain chain, the barrier of the interior desert, by a complex of valleys. Commerce, agriculture, cattle-breeding, and the chase are the chief occupations. The climate is dry but healthy. Pop. about 150,000.

Hadrian, ha'drĭ-an (PUBLIUS ÆLIUS HADRIANUS), Roman emperor: b. Rome 24 Jan. 76; d. Baiæ 10 July 138. For his ardor in the study of Greek he earned the nickname of Græculus. A nephew of Trajan, he was adopted by that emperor, fought under him against the Dacians with some glory, and, having been entrusted with the praefecture of the East and the command of the Roman armies in the East early in 117 when Trajan left the field, Hadrian, upon Trajan's death later in the same year was made emperor by his soldiers. He quickly realized that he could make no forcible head against the simultaneous attacks of the Parthians and, in Dacia and Moesia, of barbarian foes, to say nothing of revolt in Syria and Egypt. With the true insight of a diplomat he foresaw that the extreme East must be either surrendered voluntarily or lost, and chose the former alternative as the least costly. Hence he gave up Armenia, Mesopotamia, and Assyria, all comparatively new Roman provinces, to the Parthian power, and withdrew the Roman eagles to the west of the Euphrates. In 119, for the purpose of becoming acquainted with the state of the provinces, he began his celebrated journey, which he is said to have performed chiefly on foot, marching bareheaded 20 miles a day and sharing cheerfully the hard fare of the humblest soldier. He visited Gaul, Germany, Britain, where he built the famous wall extending from the Solway to the Tyne, Spain, Mauritania, Egypt, Asia Minor, and

Greece, whence he returned to Rome after his circuit of the empire in 126 or 127 A.D., and received the title of "Pater Patriæ." Hadrian spent the years 132 and 133 in Athens, which city he adorned with splendid and costly buildings. After once more visiting Syria and crushing a desperate Jewish revolt, he returned to Italy, and spent the last years of his life at Rome and his villa. During his reign the army was vigorously disciplined and reorganized. As a civil ruler he merits high praise for the just and comprehensive view he appears to have taken of his duties as a sovereign. Hence to him is attributed, more than to any other, the consolidation of the monarchical system of Rome. Hadrian also divided Italy into four parts under four consuls, to whom was entrusted the administration of justice. Hadrian had a passion for building: his most splendid edifices were a famous villa at Tibur (now Tivoli), and in Rome the Aelian bridge, built in 136, and now styled the Pont Sant' Angelo. This bridge leads to the emperor's splendid mausoleum, the Moles Hadriani. He likewise laid the foundation of several cities, the most important of which was Adrianopolis. He was a lover of the fine arts and set a high value on Greek literature. No fragment of ancient literature has been more famous than the verses attributed to the dying Hadrian:

Animula vagula, blandula
Hospes comesque corporis
Quæ nunc abibis in loca
Pallidula, rigida, nudula,
Nec ut soles dabis jocos?

David Johnston, in his 'Translations, Literal and Free, of the Dying Hadrian's Address to his Soul' (1877), gives no fewer than 116 translations of all degrees of excellence. Among well-known writers, Byron, Prior, Pope, and Merivale have attempted renderings. Consult: Gregorovius, 'Der Kaiser Hadrian' (1884); Durr, 'Die Reisen des Kaisers Hadrian' (1881).

Hadrian's Wall, a wall in the north of England, called also the Roman Wall and the Wall of Severus. Before Agricola advanced into Scotland he established forts between the estuary of the Tyne and the Solway Firth, to protect him from attack in his rear. He adopted the same precaution before leaving the Lowlands of Scotland for the Highlands, placing encampments between the firths of Forth and Clyde. Afterward walls were constructed on these two lines. On the English side of the Border is a stone wall with a ditch on its north side. Attached to it are stationary camps, mile-castles, and turrets for the accommodation of the soldiery who manned it. To the south of the stone wall is a series of ramparts generally called the *vallum.* This fortification consists of three aggers or mounds and a ditch. The military way along which the soldiery moved lies between the *murus* or stone wall and the vallum. The wall was not intended as a mere fence to block out the Caledonians, but as a line of military strategy. Hadrian is now generally believed to have been the builder of the whole structure. Severus, however, repaired it before he advanced into Scotland. Agricola came to Britain in 78 A.D. Hadrian came toward the close of 119 A.D. Severus died in 211 A.D. Considerable portions of Hadrian's Wall yet remain. In two places the wall stands nine feet high. See Collingwood Bruce, 'The Roman Wall' (1851); and 'Handbook to the Roman Wall' (1863); Neilson, 'Per Lineam Valli' (1891); Creighton, 'Carlisle' (1889).

Hadrosaurus, hăd-rō-sâ'rŭs, **or Trachodon,** a genus of duck-billed dinosaurs of the Cretaceous rocks of North America. Compare CLAOSAURUS.

Haeckel, hĕk'ĕl, **Ernst,** German naturalist: b. Potsdam, Germany, 16 Feb. 1834. He studied at Berlin, Würzburg, and Vienna, taking his medical degree in 1858 and practising that profession a short time in the former city. During 1859 and 1860 he made a journey through Italy and Sicily in the interest of science, his work on 'The Radiata' (1862), being a result. Later portions were added in 1887 and 1888. In 1861 he settled in Jena for the study of comparative anatomy, but soon turned to the specific investigation of zoology, and after holding subordinate positions, was appointed in 1865 full professor at Jena. His researches had to do especially with the lower ranks of marine animals, and above all, with deep-sea life in its simplest forms. The material for such study was gathered from many and extended experiences in the North Sea, the Mediterranean, the Canary Isles, and the Indian Ocean. These travels and researches were the basis of works like the 'History of the Development of the Siphonophora' (1869); and 'Biological Studies' (1870). These, however, were introductory to greater representative works on natural philosophy and the development theory, such as 'Calcareous Sponges' (1872); 'Natural History of Creation' (1868), — which has received the honor of translation into twelve languages,— and his master work 'General Morphology of Organisms' (1866). More popular writings, making him known to a public much wider than the biologist ever addresses, are those 'On the Division of Labor in Nature and Human Life' (1869), 'On the Origin and Genealogy of the Human Race' (1870), 'Life in the Great Marine Animals'; 'The Arabian Corals' (1873); 'The System of the Medusa' (1880); and 'A Visit to Ceylon.' For many years he has devoted his attention to the deep-sea explorations of H. M. S. Challenger expedition, of which he has written voluminous reports in English. His general biologic conclusions regarding the life and growth of deep-sea organisms are given in his 'Plankton Studies' (1890), while his 'Monism as the Link between Religion and Science' may be considered as in a certain sense his confession of faith.

Hæmatemesis, hē-ma-tĕm'ĕ-sĭs, vomiting blood, which comes from the stomach, or œsophagus. It may result from alcoholism, poisoning, or cirrhosis of the liver. It is more frequent in later life than hæmoptysis (q.v.) but may occur in the acute perforating ulcers of the stomach in young women. It is frequently associated with cancer, but it results also from external violence.

Hæm'atin, or **Hem'atin.** See HÆMOGLOBIN.

Hæmatoxylin, hē-ma-tăx'ō-lĭn ($C_{16}H_{14}O_6$), the coloring matter of logwood, or *Hæmatoxylon Campechianum,* got from the extract by allowing it to stand some days in contact with ether, decanting, removing the ether, and adding water. Hæmatoxylin gradually deposits, and the crystals by pressure and recrystallization from water containing a little ammonium sulphite can be

got nearly colorless. Combined with three molecules of water it forms dimetric, with one of water trimetric crystals. The crystals are large, transparent, and brilliant, and have a sweet taste. Hæmatoxylin dissolves sparingly in water, but it is taken up very freely by solution of borax, by hypo-sulphite of sodium, phosphate of sodium, and some other salts. It is also soluble in ether and in alcohol. By acids it is not readily affected, but it reacts at once with alkalies, forming colored solutions, and with metallic oxides forming precipitates of various colors. By joint action of air and bases hæmatoxylin is oxidized and becomes transformed into hæmateïn.

Hæmaturia, hem-a-tū'rĭ-a, the presence of blood in the urine, which points to disease of the kidney or bladder. It is a symptom of some gravity. The treatment of the cause will probably remove this affection; in all cases complete rest is very important. See TREMATODA.

Hæmoglo'bin, or **Hemoglo'bin,** an organic coloring matter, which constitutes about nine tenths of the weight of dried red blood corpuscles, and serves as a carrier of oxygen from the lungs to the general tissues of the body. It is an exceedingly complex substance, and its formula is not certainly known. Zinoffsky gives it as $C_{712}H_{1130}N_{214}S_2FeO_{245}$; but this can hardly be regarded as more than a guess. According to many authorities, hæmoglobin is not a definite chemical compound, but a more or less variable mixture of simpler substances. It gives all the general reactions of the proteids, but, unlike most of the proteids, it may easily be obtained in crystalline form, its crystals commonly occurring in rhombic plates or prisms, varying somewhat in shape, according to the source from which the substance is prepared. The exceeding physiological importance of hæmoglobin depends upon the fact that it readily combines with oxygen to form a very unstable compound known as oxyhæmoglobin. The combination takes place as the blood corpuscles containing the hæmoglobin pass through the lungs; and the loosely-combined oxygen is given off again as the corpuscles pass through the capillaries, the oxyhæmoglobin being thereby again reduced to hæmoglobin. Hæmoglobin also combines with carbon monoxid to form a similar but far more stable substance known as carboxyhæmoglobin. In poisoning by the inhalation of coal-gas the carbon monoxid present in the coal-gas combines with the hæmoglobin in the lungs, and the carboxyhæmoglobin so formed does not break up again. As the absorption of the coal-gas proceeds, a continually increasing quantity of hæmoglobin is therefore destroyed, so far as its utility as an oxygen-carrier is concerned. In extreme cases of such poisoning, transfusion of blood is resorted to, in order that the patient may have a sufficient supply of hæmoglobin to transport the requisite quantity of oxygen from the lungs to the other tissues of the body.

The preparation of pure hæmoglobin is a difficult operation, and for its details reference should be made to Gamgee's 'Physiological Chemistry.' One of the best methods that have been proposed consists in adding to defibrinated blood about one sixteenth of its own volume of ether, and shaking the mixture. This treatment causes the red corpuscles to break up, and the fluid becomes lake-colored. After a time, varying from a few minutes to three days, according to the source of the blood, a heavy deposit of minute crystals of oxyhæmoglobin is thrown down. This may be purified by washing with 25 per cent alcohol, and subsequent recrystallization. Crystals of hæmoglobin itself have also been prepared. Pure hæmoglobin has a purplish color, which gradually passes into a scarlet or a yellowish red, as the substance absorbs oxygen and becomes thereby converted into oxyhæmoglobin. Carboxyhæmoglobin is even more brilliantly red than oxyhæmoglobin. All three of these substances exhibit marked absorption spectra when in solution, and very small quantities of them can be easily detected by the spectroscope. It is said that the presence of one part of hæmoglobin in ten thousand parts of water can be distinctly demonstrated by this means.

When oxyhæmoglobin is acted upon by acids or alkalies, or by the gastric juice, it is resolved into a proteid substance and a definite compound which has the probable formula $C_{68}H_{70}N_8Fe_2O_{10}$ and is known as hæmatin. Hæmatin may be best prepared by extracting blood clot, directly, with hot alcohol to which a small quantity of sulphuric acid has been added. The extract is next agitated with chloroform, which takes up the hæmatin. The chloroform is then separated, washed with water to remove the acid, and allowed to evaporate, when the hæmatin is deposited in the form of a bluish-black powder. Hæmatin is a very stable compound, and may be heated to 350° F. without decomposition. At higher temperatures it burns with evolution of hydrocyanic acid, leaving an ash composed chiefly of oxid of iron. It is insoluble in water, ether, dilute acids, and pure alcohol; but it dissolves readily in solutions of the caustic alkalies, and in alcohol to which a small quantity of sulphuric acid has been added. Consult Gamgee, 'Physiological Chemistry.'

Hæmophilia, a congenital inherited disease characterized by a tendency to obstinate bleedings. Women are very rarely affected, but transmission of the disease seems to be from the father through the daughters to the grandsons, and from father to son. The disease usually makes itself evident in early life, a slight wound being followed by abnormal hemorrhage, whereby the child becomes known as a "bleeder." The exact fault in nature's ordinary method in plugging blood-vessels has not been discovered; the shed blood will clot naturally. Besides the liability to excessive hemorrhage, these subjects are frequently afflicted with trouble in the joints, probably a chronic inflammation, the result of repeated small hemorrhages. Death is always imminent, as nothing can stop the flow of blood where large areas of the body are injured. Chlorides are used with some success for those mildly afflicted with the disease, particularly the chloride of calcium.

Hæmop'tysis, expelling blood from the lungs, larynx or bronchial tubes by coughing, which may be a symptom of phthisis. Morphine is useful immediately after such hemorrhages, but modern medicine rejects the use of styptics.

Hæmorrhoids (Greek, *haima*, blood, and *rheo*, to flow), literally, a flow of blood. Until the time of Hippocrates this word was used, conformably to its etymology, as synonymous with hemorrhage. It was afterward used in a

narrower sense, to indicate the flux of blood at the extremity of the rectum, and in some other cases which were considered analogous to it; thus it was applied to the flow of blood from the nostrils, the mouth, the bladder, and the uterus. It is at present used to signify a particular affection of the rectum, although the disease is not always attended with a flux; in this sense the affection is also called piles. Certain general causes may produce a predisposition to this disease; in some cases, it appears to be the effect of a hereditary disposition; in general, it manifests itself between the period of puberty and old age, although infants and aged people are not entirely exempt from its attacks. Men are oftener affected than women, in whom it is sometimes produced by local causes. It often shows itself in subjects who pass suddenly from an active to a sedentary life, or from leanness to corpulency. Any circumstance which produces a tendency to pressure on the venous return of blood in the pelvis is to be reckoned as a local cause. The accumulation of fæcal matter in the intestines as in habitual constipation; efforts to expel urine; the pressure produced by polypi; the obstruction of any of the viscera, especially of the liver; worms; use of drastic purges, particularly of aloes; long continuance in a sitting posture; riding on horseback; pregnancy; the accumulation of water by ascites;— such are some of the ordinary causes of hæmorrhoids.

Several varieties of hæmorrhoids are distinguished. They are known as external when apparent at the anus; internal when concealed within the orifice; blind or open, regular or irregular, active or passive, periodical or anomalous, etc. There is also a great difference in the quantity of blood discharged; it is usually inconsiderable, but in some cases is so great as to threaten the life of the subject. The quality, color, etc., of the blood, also differ in different cases. The number, seat, and form of the hæmorrhoidal tumors likewise present a great variety of appearances. When the disease is purely local it is cured more readily; but in the greatest number of cases it is connected with some other affection, or with the constitution of the subject. In these cases, if the piles are not troublesome on account of their size, or if the bleeding is not very considerable, cure of the primary affection should be attempted. The best mode of treatment is then to recur to hygienic rather than medicinal influences. The subject should avoid violent exercises, but moderate exercise will be found beneficial. The standing position is to be avoided as much as possible, especially following defecation. The constipation (q.v.) with which the subjects of this disease are liable to be affected should be remedied by hygienic dieting. If the pain is considerable, recourse should be had to sedatives and local application of hot water. If the disease appears under a more severe form, more violent remedies will become necessary. If the discharge of blood becomes excessive, particular care must be taken to regulate it. If the tumors acquire a considerable volume, surgical operations are necessary. At the present time the operative treatment of persistent hæmorrhoids is both safe and efficacious.

Hafiz, hâ-fîz', the pseudonym of MOHAMMED SHEMS ED DÎN, Persian poet: b. Shiraz in the beginning of the 14th century; d. 1388. The surname Hafiz was given him because he knew the Koran by heart. He was also called *Shakarlab* (Sugar-lip), from the flowing melody of his ghazals or short lyrics; and *Lissan Elghaïb* (the Mysterious Voice), from the deep mystic meaning said by his warmest admirers to be contained in many of his poems. He preferred independent poverty as a dervish to a life at court, whither he was often invited by Sultan Ahmed. He became a sheik or chief of a fraternity of dervishes, and died at Shiraz where a monument was erected to him, still frequently visited by pious Moslems. He is the greatest lyrical poet of Persia, and he furnishes the safest guide to Persian thought and manners. The songs of Hafiz were collected into a *Divan* (a Persian word for a collection of poems) after his death, which was first published at Calcutta in 1791, and translated into German by the celebrated orientalist Hammer-Purgstall (1812–13). A complete English translation by Clarke appeared in 1891. A critical edition of the Persian text, with scholia, etc., was published by Hermann Brockhaus (1854–61). Consult Horn, 'Geschichte der persischen Litteratur' (1901).

Hag-fish, a name given to the species of the families *Heptatremidæ* and *Myxinidæ Myxine*, and *Bdellostonia* of the class of Cyclostomi (q.v.). They are eel-like in shape, lack all paired fins, have a suctorial mouth, without jaws; a single nostril at the tip of the head and either one (*Myxine*) or from 6 to 14 (*Polistotrema*) gill openings along the sides of the body. Around the mouth are eight barbels, and the nostril connects with the cavity of the mouth. The skin contains numerous mucus-glands and also numerous pockets of "thread cells," the protoplasm of which is converted into long threads, which, when discharged, unwind and, together with the mucus, form a jelly-like mass protecting the animal. The eggs are large, oval in shape and enclosed in a horny case provided with hooks on each end by which they are anchored to sea weed, etc., on the bottom. Where abundant the hag-fishes are among the greatest pests of the fishermen. They attach themselves to other fishes in the neighborhood of the gills or on the eyes, and thence work themselves rapidly into the interior of the body, devouring the viscera, muscles, etc., so that there remains "a living hulk of head, skin and bones." The California hag-fishes (*Polistotrema Stouti*) will devour a fish of 10 or 15 pounds in a single night, and it is believed that they enter the fishes after they are taken in the nets. The hag-fish of the eastern coast (*Myxine glutinosa*) ranges north of Cape Cod, and in the European seas, south to the English Channel. Other species occur in other parts of the world.

Hagar, hā'gạr, an Egyptian handmaid in Abraham's house. She was presented by her mistress Sarah to Abraham, in order that Abraham might not die without descendants, Sarah herself being barren. Hagar bore Ishmael; but Sarah soon became jealous of her, and treated her severely. When Sarah bore Isaac, Hagar was sent away by Abraham, who, the Bible informs us, had received a divine order to dismiss her. She suffered much distress in the desert, but was relieved by an angel, and married her son to an Egyptian woman.

Hagen, Gotthilf, gŏt'hĭlf hä'gĕn, German hydraulic engineer: b. Königsberg, Prussia, 3 March 1797; d. Berlin 3 Feb. 1884. He studied at the University of Königsberg; in 1816 observed at Kulm the total eclipse of the sun, but later turned his attention from astronomy to engineering, and from 1831 to 1849 was professor of hydraulic engineering in the School of Engineering. The naval harbor of Wilhelmshafen, one of the strongest on the German Ocean, was built from his designs. In 1869 he became director of the Prussian building department. His most important work is his 'Handbuch der Wasserbaukunst' (1841–65), besides which he published numerous other volumes, including: 'Die Kanalisierung der obern Saar' (1866), and 'Untersuchungen über die gleichförmige Bewegung des Wassers' (1876).

Hagen, Theodor, tā'ō-dōr, German painter: b. Düsseldorf 24 May 1842. He became known through his landscapes of the Eifel Mountains and Westphalia, in 1871 was appointed professor in the Weimar art school, of which he was also director from 1877. In 1881 he resigned both posts and returned to Düsseldorf. He obtained a gold medal at the Berlin exposition of 1891. Among his works, distinguished by their forceful drawing and excellence of aërial perspective, are: 'The Kanderthal in Switzerland'; 'Sunset in the Siegenthal'; 'Spring Weather'; 'Swiss Landscape, with the St. Gothard Pass'; 'Town on the Lower Rhine — Evening.'

Ha'gerstown, Md., city, county-seat of Washington County, on Antietam creek, and on the Baltimore & O. the Cumberland V., the Norfolk & W. and the Western M. R.R.'s. Here are extensive manufactures of knit goods, bicycles, machinery, steam engines, lumber, etc. It is the trade centre of western Maryland and contains a court-house, high school, Bacon's School for boys and girls, electric light and street railways, three national banks, and an assessed property valuation of $7,000,000. Pop. (1900) 13,591.

Haggadah, ha-gä'da, one of two rabbinical biblical interpretations forming the Midrash (q.v.).

Haggai, hăg'ī, the tenth of the minor prophets, and first of those who prophesied after the captivity. He was born in Babylon, and joined the first band of exiles who, on the issue of the decree of Cyrus (536 B.C.) returned to their own land. He was buried among the priests at Jerusalem, as belonging to the family of Aaron. The book of Haggai consists of four distinct prophecies and has but one theme, the building of the second temple. The brevity of the several prophecies is so great, and the poverty of expression which characterizes them so striking, as to give rise to an idea that in their present form they are but the outline or summary of the original discourses. They were delivered in the second year of Darius Hystaspes (520 B.C.), at intervals from the first day of the sixth month to the twenty-fourth day of the ninth month in the same year. The closing prediction foreshadows the establishment of the Messianic kingdom upon the overthrow of the thrones of the nations.

Haggard, hăg'ard, **Andrew Charles Parker,** English novelist: b. Bradenham Hall, Norfolk, 7 Feb. 1854. He is a brother of H. R. Haggard (q.v.) and besides serving with distinction in the English army has published 'Dodo and I'; 'Polyglot Poems'; 'Under Crescent and Star'; 'Love Rules the Camp,' and other books.

Haggard, Henry Rider, English novelist: b. Bradenham Hall, Norfolk, England, 22 June 1856. At 19 he went as secretary to Natal, and served on the staff of Theophilus Shepstone during his mission to the Transvaal in 1877. In 1884 he was admitted to the bar of Lincoln's Inn, but has devoted his time mainly to authorship and agriculture. His novels of South African life have attained a wide popularity both at home and in the United States. Among his works are: 'Cetewayo and His White Neighbors' (1882); 'Dawn' (1884); 'The Witch's Head' (1885); 'King Solomon's Mines' (1886); 'Jess' (1887); 'She' (1887); 'Allan Quatermain' (1888); 'Colonel Quaritch, V. C.' (1888); 'Cleopatra' (1889); 'Beatrice' (1890); 'Montezuma's Daughter' (1894); 'Doctor Therne' (1898); 'History of the Transvaal' (1900); 'Lysbeth' (1901); 'Rural England' (1902); 'A Gardener's Year' (1905); etc.

Haghe, Louis, loo-ē häg, Belgian painter and lithographer: b. Tournai 17 March 1806; d. London 9 March 1885. At first an architect, he turned to landscape painting, in 1832 went to London, there as a lithographer entered partnership with William Day, then became interested in water-color painting, and in 1873–84 was president of the New Water Color Society. He painted by preference old Flemish interiors, such as 'Audience Chamber at Bruges,' but also scenes from English history ('Cromwell with the Letter of Charles I.'), and other subjects. In oils he was less successful. He worked entirely with his left hand.

Hagiographa, hā-jī-ŏg'ra-fa, a Greek word, signifying sacred writings, first introduced by Epiphanius as the rendering of the Hebrew word *Ketubim* = writings. The third and last great division of the Old Testament books, the others being Torah (the Law) and Nebiim (the Prophets). The three-fold division is alluded to in the New Testament, the several parts being described as "the law" or "Moses," "the Prophets," and "the Psalms" (Luke xxiii. 44). In this passage the Psalms are the Hagiographa. When the division is twofold, the Law and the Prophets, the Hagiographa are merged in the second category (Matt. v. 17, xi. 13). In our present Hebrew Bibles the Hagiographa consist of 13 books thus arranged: Psalms, Proverbs, Job, Song of Solomon, Ruth, Lamentations, Ecclesiastes, Esther, Daniel, Ezra, Nehemiah, and I. and II. Chronicles, but the list is otherwise drawn up by many authorities.

Hagonoy, hä-gō-noi', Philippines, a pueblo of the province of Bulacán, island of Luzon, on the Grande de la Pampagna River, about three miles from Manila Bay, seven miles southwest of Malolos. Lake Hagonoy is partly within the precincts of the town; this lake dries up in the summer season, so that the lake bed can be cultivated. Pop. 20,100.

Ha'good, Johnson, American soldier: b. Barnwell, S. C., 21 Feb. 1829; d. there 4 Jan. 1898. At the beginning of the Civil War he entered the Confederate army and in 1862 he

came a brigadier-general. He fought against Gillmore at the siege of Charleston (1863), and was commander of Battery Wagner. With his brigade he participated in the battle of Cold Harbor, and subsequently was in the trenches at Petersburg. He took part also in the operations north of the James after the surrender of Fort Harrison, and commanded Bragg's rear guard at Fort Fisher.

Hague, hāg, **Arnold,** American geologist: b. Boston 3 Dec. 1840. He was graduated at the Sheffield Scientific School of Yale (1863); studied three years at the universities of Göttingen and Heidelberg, and in 1867 was appointed assistant geologist on the United States geological exploration of the 40th parallel. His published works are: 'The Volcanoes of California, Oregon, and Washington Territory' (1883); 'The Volcanic Rocks of the Great Basin' (1884); 'The Volcanic Rocks of Salvador' (1886); 'Crystallization in the Igneous Rocks of Washoe'; 'Geology of the Yellowstone National Park' (1899).

Hague, George, Canadian financier: b. Rotherham, Yorkshire, Eng., 1825. In 1854 he went to Canada, where in 1856–76 he was connected with the Bank of Toronto. Subsequently he became general manager of the Merchants' Bank. He was also elected first president of the Canadian Bankers' Association and of the Montreal Good Government Association, and made generous gifts to various charities.

Hague, The (Holland), one of the chief towns, practically the capital of the kingdom, 33 miles southwest from Amsterdam, 16 miles northwest of Rotterdam, within 3 miles of the sea. It is the residence of the queen and of the foreign ambassadors, and the seat of the States-General of the Netherlands, and of the principal part of the central administration of the kingdom. Among the most important structures are the royal palace, in the Nordeinde, the palace of the Prince of Orange, the palace of Prince Frederick of the Netherlands; the Binnenhof, a large irregular building, founded in 1249, and containing the hall of assembly of the States-General, and various government offices, the provincial government-house, a large roomy edifice; the town-hall; the ministry of justice; the municipal museum, containing pictures and antiquities; the royal library, containing 500,000 volumes, besides valuable collections of medals and cameos; a cannon foundry, one of the largest and most conspicuous buildings in the town, colonial office, war office, the national monument, erected to commemorate the restoration in 1813 of Dutch independence. There are many other monuments to attract attention, particularly the equestrian statue of William I. of Orange, in front of the royal palace, and the figure of Shinoya, placed opposite the house in which he lived, etc. The royal collection of pictures, in the Prins Mauritshuis, embraces a picture gallery chiefly confined to Dutch masters. The parks, gardens, markets and suburbs of the city are famous for their beauty and interest. The special educational facilities of the city are excellent, and there are good public schools. There are also many learned societies in the city, among which may be mentioned The Hague Society for the Defense of the Christian Religion, the Witte Society, the Physics Society and the Netherland-India Institute. The Hague is not a manufacturing or commercial city, its chief revenue being derived from the throngs of foreigners who visit the city and watering place on the coast.

The origin of The Hague may be traced to the building of a hunting seat here of the counts of Holland in 1250. It is the birth-place of William II., prince of Orange, and William III., prince of Orange and king of England. Here was held the International Peace Congress in 1901–2. Pop. (1900) 199,285.

Hague Court, The, a permanent tribunal for international arbitration established as a result of The International Peace Conference, held in May, June, and July 1899 at The Hague, the governmental seat of the Netherlands.

The Hague International Peace Conference was one of the most important events which marked the close of the 19th century, and has been justly styled "the first great parliament of Man". The Conference assembled in response to a rescript issued by Czar Nicholas II. of Russia, 24 Aug. 1898, inviting to a conference all governments with representatives accredited to the Imperial Court. The Conference was to occupy itself with the great problem of universal peace, especially through the international diminution of armaments by land and sea, and the prevention of armed conflicts by pacific diplomatic procedure. The invitation was accepted by all the governments to whom it was tendered, and the first meeting for the Conference was fixed for 18 May 1899 at The Hague,— the capital of the Netherlands being selected, as stated by the Russian minister of foreign affairs, because "His Imperial Majesty considered it advisable that the Conference should not sit in the capital of one of the Great Powers where so many political interests centre that might impede the progress of a work in which all the countries are equally interested". The Conference was held at the celebrated Huis ten Bosch — House in the Wood,— the members assembling in the historically decorated Orange Hall. Each nation was represented by prominent diplomats, jurists, men of affairs, soldiers, and sailors, the representatives of the United States being Ambassador Andrew D. White, Minister Newel, General Crozier of the army, Captain Mahan of the navy, Seth Low, mayor of New York, and F. W. Holls of the New York bar. The president of the Conference was Baron de Staal of the Russian delegation.

Three committees were formed to deal respectively with disarmament, regulations in warfare, and mediation and arbitration. The final act of the Conference, signed 29 July 1899, comprised three conventions or treaties embodying the results arrived at by the committees. The first and most important was the Convention for the Peaceful Adjustment of International Differences by the permanent institution of a Court of Arbitration in the midst of the independent powers, accessible to all. The second convention dealt with the laws and usages of war on land, and the third convention provided for the adaption to naval warfare of the principles of the Geneva Convention of 1864. Regulations also prohibited the throwing of projectiles and explosives from balloons; the use of projectiles intended solely to diffuse deleterious and asphyxiating gases (this was not accepted by the United States and Great Britain); and the use of soft expansive bullets. The last two conventions embodied the wisest and most humane principles of military conduct resulting from a study and dis-

cussion of these matters during the half-century preceding, and which had their first codification in the "Instructions for Guidance of the Armies of the United States" issued at the beginning of the Civil War.

The Convention for the Peaceful Adjustment of International Differences, however, was the crowning work of the Conference, and was a source of much gratification to the advocates of international arbitration, as bringing to fruition a sentiment which for centuries had hoped for the establishment by the nations of the earth of some permanent form of congress or court, which should be vested with functions to insure the preservation of peace and to deliver the world from the strife and carnage with which it had been afflicted in all the past ages.

During the last decade of the 19th century peace advocates had been persistent in their advocacy of a permanent court of arbitration. In 1894, at its meeting in Holland, the Interparliamentary Union, a voluntary organization of members of the national legislative bodies of the nations, adopted a declaration in favor of a permanent court of arbitration; and in 1896 resolutions to the same effect were unanimously adopted in the United States at the annual Mohonk Conference on international arbitration, and by the New York State Bar Association, the latter presenting to the President of the United States a memorial setting forth a permanent tribunal as the essential feature of any general scheme of arbitration. The honor of presenting such a proposition in The Hague Conference fell to Lord Pauncefote, chairman of the British delegation; Germany was antagonistic, but the sentiment was so strongly in its favor that the German delegates were induced to withdraw their objection, and provision was made for its consummation. The fourth division of the Convention in 47 articles provides for the creation of the Court, defines its jurisdiction and the principles which are to guide it, specifies the manner in which its members are chosen, the rules governing its procedure, its awards, and other necessary details. The Convention provides that each of the 26 signatory powers shall appoint for a term of six years as members of the Permanent Court not more than four persons "of recognized competence in questions of international law, enjoying the highest moral reputation." These persons constitute a Permanent Court of Arbitration, accessible at all times and acting in accordance with the prescribed rules of procedure; they do not, however, sit as a collective body, but when two or more nations have a case to submit to arbitration, they select by mutual agreement one, three, or five members, who will act as the tribunal to try the case. Thus it happens some members of the Court may never be called upon to discharge the functions of a judge. Also, although The Hague is designated as a place where the Court shall hold its sessions, another place may be designated by agreement of the litigant parties. Under the presidency of the Dutch minister of foreign affairs, the diplomatic agents of the signatory powers, in residence at The Hague, constitute a permanent council which serves as the office of the Permanent Court of Arbitration. The first cases adjudged by the Court were the Pious Fund Claim between Mexico and the United States in 1902, and the difficulties of Venezuela with the United States and various European nations in 1903.

For the erection of a Temple of Peace comprising a comprehensive library of international law, and a courthouse which could be used as a meeting place for the Permanent Court of Arbitration, Andrew Carnegie on 25 April 1903 donated the sum of $1,500,000 to be administered by the Government of the Netherlands as trustee for the other signatory powers of The Hague Convention of 29 July, 1899. Consult Foster, "Arbitration and The Hague Court" (1904); Holls, "The Peace Conference at The Hague" (1900); Penfield, "Some Problems of International Arbitration" (1904).

Hahn, hän, **August,** German Protestant theologian: b. Grossosterhausen, Saxony, 27 March 1792; d. Breslau, 13 May 1863. He studied at Leipzig, and was appointed in 1819 professor extraordinary of theology at Königsberg. In 1826 he became professor of theology at Leipzig, and in 1833 was called to Breslau, and in 1844 became general superintendent of the Province of Silesia. Among his best known works are his Hebrew Bible (1831) and his 'Bibliothek der Symbole und Glaubensiegeln der Apostolisch-Katholischen Kirche' (1842, 2d ed. 1878).

Hahnemann, hä'nĕ-män, **Samuel Christian Friedrich,** German physician; founder of the homœopathic system: b. Meissen 10 April 1755; d. Paris 2 July 1843. In 1775 he went to Leipsic, where, against his father's will, he studied medicine, and found the means chiefly by the translation of English medical works. At a later period he went to Vienna, and after some years he returned and completed his studies at Erlangen. He afterward practised medicine at various places, but gave it up for a time, until, in 1789, by the translation of Cullen's 'Materia Medica,' he was led to adopt a new method of cure. His system was fully explained in his 'Organon der rationellen Heilkunde' (1810). In 1820 the government prohibited him from dispensing medicines, and thereby, from his inability to have them prepared by druggists, obliged him to give up his practice. Duke Ferdinand of Anhalt-Köthen, however, gave him an asylum at Köthen, and conferred upon him the title of Hofrath. Here he remained till 1833, when he proceeded to Paris, where he hoped to find a wider sphere for his operations. The result equaled his expectations; and a royal decree issued in 1835 authorized him to practise homœopathy. Among his works should be named 'Dictionary of Materia Medica,' his 'Essays on Poisoning by Arsenic, and on the Effects of Coffee,' and his treatise on 'Chronic Affections.' Consult: 'Life and Letters,' by Bradford (1895). See HOMŒOPATHY.

Haidarabad, hī-da-ra-bäd'. See HYDERABAD.

Hail, small masses of ice or frozen rain falling from the clouds in showers or storms, varying in their form, being either angular, pyramidal, or stellated; as well as in their consistency, being sometimes as hard as ice and sometimes as soft as snow. The theory that the formation of hail is dependent on the presence of whirlwind phenomena in the upper atmosphere, has gained considerable acceptance. The formation of the alternate coatings of ice and snow is, on this theory, produced by a series of vortical ascents and descents to and from an upper snow region and a lower region where the temperature is rather higher.

Hail Columbia, a national song of the United States. The words written during a period of great political excitement in 1798, by Judge Joseph Hopkinson, were set to the melody of the 'President's March,' composed the same year in honor of President Washington, by Pfyles, orchestral leader at the John Street Theatre, New York. The composition first sung at a theatrical benefit attained great popularity, and on account of its patriotic sentiments has become a representative national song.

Hail Mary, Ave Maria, or **Angelical Salutation,** a prayer consisting of three parts: the first, the words by which the angel addressed the Blessed Virgin (Luke I. 24) with the word Mary after "Hail"; the second, the words by which Elizabeth addressed Mary (Luke I. 42), to which has been added the word Jesus; the third, the words: "Holy Mary, Mother of God, pray for us sinners now and at the hour of our death — Amen." The name, "Angelical Salutation," comes from the first part of the prayer, which is the salutation of the angel. The first and second parts, taken from the Bible, were in use in their present form in early times; but the words of the third part were varied until the 16th century when the present form was approved and adopted by Pope Pius V. The prayer is in general use among Roman Catholics and is found in many Anglican books of devotion.

Hailes, Lord. See DALRYMPLE, SIR DAVID.

Hai'leybury College, England, an institution at Hailey, near Hertford, 20 miles north of London, founded by the East India Company in 1806, as a training school for admittance to the service of the company. It attained a high reputation, and numbered among its alumni, the most distinguished names connected with the Indian administration of the 19th century. After the Indian Mutiny of 1857–8, and the government reorganization of the Indian Civil Service, the college was closed for four years. It was reopened under a royal charter in 1862 as a public school, and while maintaining many of the traditions of its famous predecessor is no longer an Indian service training ground. Handsome modern buildings have been added to the old college quadrangle, built in 1809; the surrounding grounds cover nearly 100 acres. Consult: Lowell, 'Colonial Civil Service' (1900); Monier-Williams, 'Memorials of Old Haileybury College' (1894).

Hailmann, hāl'man, **William Nicholas,** American educator: b. Canton Glarus, Switzerland, 20 Oct. 1836. He studied at the medical college of Louisville, Ky., was director of the German-American Seminary at Detroit in 1878–83, in 1894–8 was national superintendent of Indian schools, and in 1898 became superintendent of instruction at Dayton, Ohio. Among his writings are: 'History of Pedagogy' (1870); 'The Application of Psychology to Teaching' (1887); 'Place and Development of Purpose in Education' (1899).

Hair, strictly speaking, the peculiar epidermal covering of the body in mammals, although by analogy the term is loosely applied elsewhere, as to the setæ of annelids, the slender modified spines of caterpillars, etc. Hair is present in every mammal, although the amount may be greatly reduced so that in certain whales it occurs only in the fœtal stage, in others is limited to two bristles on the lips. The structure is best understood by following the development. In the earliest stage (Fig. 1) there is merely a thickening of the Malpighian layer of the epidermis (see SKIN) at the points where the hair is to be found. This thickening increases in amount, and thus forms a solid plug (Fig. 2) which projects into the underlying

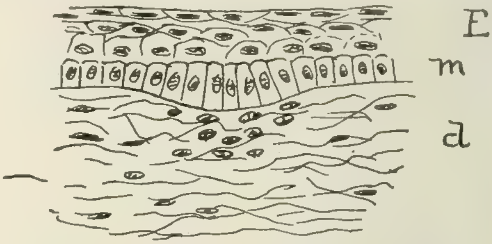

FIG. 1.—SECTION THROUGH THE EARLIEST STAGE OF HAIR FORMATION.

E, epidermis, showing in *m*, the Malpighian layer, the elongation of the cells; *d*, derma, with proliferation of cells to form the papilla shown in Fig. 2.

derma. At the same time the cells, which are scanty in most parts of the derma, become abundant beneath the ingrowing plug, and form the basis of the future papilla. Next a ring-shaped pit appears on the outer surface of the plug and gradually becomes deeper, cutting the epidermis into two parts, an outer root-sheath and an inner rod-like part, the hair itself, while

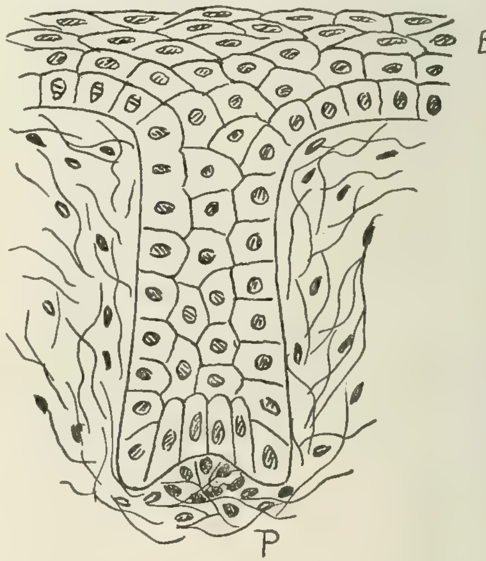

FIG. 2.— SECOND STAGE IN HAIR FORMATION.

The epidermis, *E*, has now formed a solid plug extending down into the derma; the papilla, *P*, has begun to form at the apex of the epidermal ingrowth.

the pit forms the follicle (see Fig. 3). The papilla grows into the base, bearing blood-vessels, while the Malpighian layer at this point forms the tissue from which the hair grows. In the hair itself several parts are recognized — a central pithy axis, the medulla; next, a layer of

cells, the cortex, and outside this, forming the outer surface of the hair, the cuticle. Farther down in the follicle is the inner root-sheath, formed of two layers of cells known respectively by the names of the two anatomists, Henle and Huxley, who first described them. The Malpighian cells, at the base of the follicle, divide continually, and the new cells thus formed are pushed outward and are transformed into the hair. From this it will be seen that the hair is not a secretion but is composed of cornified cells. It is also apparent that the hair is not hollow.

The differences between the different kinds of hair are largely those of shape and of the amount of the various parts present. Thus in many animals two kinds of hair occur, longer and coarser hair on the outside, and beneath this a closer and softer under-fur. The coarser hairs may be enlarged into bristles, or still more enlarged to form spines, like those of the porcupines and hedgehogs. Again the hairs may become united to each other, the result being the formation of scales like those of the pangolins or horns like those of the rhinoceros. In some

cases the hair is perfectly straight, again it may be curly. The straight hairs are circular in section, the curly are flattened, the amount of curl being proportional to the amount of flattening. Certain hairs (wool of sheep, etc.) have the property of felting. This depends upon the scale-like projections of the cells of the cuticular layer. The color of the hair is due to the presence of pigments belonging to the group of melanins.

Several accessory structures (Fig. 5) are connected with the hair: sebaceous glands which empty an oily substance into the follicle to keep the hair in a moist, soft condition; nerves which are distributed to the wall of the follicle and thus render the hairs to a certain extent organs of touch, as in the whiskers (*vibrissæ*) of cats; and muscles for the erection of the hair (*erectorespilæ*). This erection may be to increase the warmth of the body by entangling a layer of air among the hairs, or it may have the purpose of protection against injury, either by terrifying some enemy or by affording a loose envelope around the body some distance from

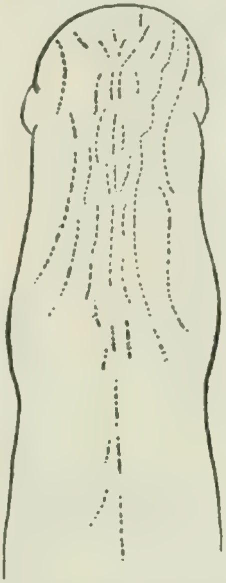

Fig. 4.— Hair tracts on the back of an embryo cat (after Maurer).

the flesh. Usually the hair is shed (molted) at regular intervals, but there are exceptions, as in the mane and tail of horses, as well as in the case of man. The hair is not scattered irregularly over the body but occurs with more or less regular arrangement. In the early embryos it is not uncommon to find it distributed in regular lines (Fig. 4). Later the lines become broken up into groups of hairs, the arrangement being characteristic of the species, but without any broad morphological significance. It should be noted that although hair and pin-feathers closely resemble each other in general appearance they are very distinct structures, hair originating in a thickening of the epidermis, while feathers (q.v.) like scales are dermal in origin. Most of the literature relating to the hair is in German. Consult the writings of Maurer, Meigerle, Weber, and Poulton, 'Quarterly Journal of Microscopical Science,' Vol. XXXVI. (1894).

J. S. Kingsley,
Professor of Zoology, Tufts College.

Hair-dressing. As the hair is the greatest ornament of the human body, the arrangement of it has always been one of the most important duties of the toilet. The ancient Hebrews esteemed fine hair a great beauty, as several passages of Scripture show. The Hebrew women plaited their hair, confined it with gold and silver pins, and adorned it with precious stones. Herodotus informs us that the ancient Egyptians

let the hair of the head and beard grow only when they were in mourning. Even in the case of young children they were wont to shave the head, leaving only a few locks on the front, sides, and back. The women, however, wore their natural hair long and plaited, often reaching down in the form of strings to the bottom of the shoulder-blades. A practice the very opposite seems to have prevailed among the ancient Assyrians, as regards men at least. In the Assyrian sculptures the hair always appears long, combed closely down upon the head, and shedding itself in a mass of curls on the shoulders. The beard was also allowed to grow to its full length. To the Greeks the hair was an object of great importance, and they devoted much time to it. Homer regularly applies to the Greeks an epithet denoting that they had ample flowing locks.

The Athenians curled their hair, and fastened it up with small golden ornaments shaped like grasshoppers, in token of their being "sons of the earth." Gold, pearls, precious stones, flowers, and ribbons were employed to ornament the tresses, and nets were also worn. False hair seems to have been latterly used, and in great quantities, both curled and frizzled. Married women were distinguished from the unmarried by the manner in which the hair was parted in front. The Romans generally wore no covering on their heads except at sacred rites, games, festivals, and in war. Women in later times wore great quantities of false hair, and dyeing the hair was common. They were particularly addicted to frizzling and curling their hair, raising it into stories of curls, some of great height. Long hairpins were used to fix the curls. Arranging the hair was a matter of great importance. Slaves frizzled and adjusted it, and a number of females learned in the art of the coiffeur superintended the process, while the fair dame herself watched the growing edifice of curls, gold, precious stones, crowns of flowers, in a mirror of polished steel, brass, tin, or silver.

On the introduction of Christianity the apostles preached against the prevailing fashion of dressing the hair. St. Paul regarded it as a shame for a man to have long hair, though the reverse for a woman. It then became common for men to cut the hair short; hence the clergy soon wore the hair quite short, and afterward even shaved their heads in part. In the time of Francis I., king of France, long hair was worn at court; but the king, proud of his wound on the head, himself wore short hair, in the Italian and Swiss fashion, which soon became general. In the reign of Louis XIII. the fashion of wearing long hair was revived, and as it became desirable to have the hair curling, the wigs were also restored.

Among the Anglo-Saxon women the custom prevailed of parting, curling, and turning the hair over the back. Anglo-Saxon men wore their hair long at the time of the Norman invasion, while the conquerors adopted the singular fashion of shaving the back of the head. Under Elizabeth, false hair was greatly worn, padded with cushions, under-propped, with forks, wires, etc., and adorned with gold, pearls, and precious stones. It is well known that the gallants of Charles I.'s time wore their hair in long flowing locks, while the closely-cropped hair of the Puritans brought the name of Roundheads down upon them. In the Queen Anne era, while the ladies wore their hair long, they generally tied it in a knot, and almost completely covered it up by extravagant head-dresses of wire and paste-board, or feathers and ribbons. At that time, and for long after, the coiffure of a lady was such a serious affair, and the hair-dressers were so fully employed, that fair wearers were often compelled to have that part of their toilet done two days before a ball, and pass the night on a chair for fear of disturbing the elaborate arrangement. This was the period of the prevalence of whitening the head with hair-powder, a preparation of pulverized starch and perfume. The custom of wearing it was introduced from France into England in the reign of Charles II. To make the powder hold, the hair was usually greased with pomade. In 1795 a tax was put upon the use of hair-powder in Great Britain, and at one time yielded $100,000 per annum, but the result was that hair-powder fell out of general use, and the French Revolution, which overturned so many antiquated customs, further contributed to throw it into disfavor. The chignon was introduced and had its day of popular favor in the 19th century, bringing back the fashion of false hair and padding to a greater or less extent. With respect to men's hair, short cutting is now universal, long hair being considered as a sign of slovenliness or eccentricity.

Hair Manufactures, the industries by which the hair of animals is employed in the production of commercial articles of ornament or utility. The strongest and most durable of haircloth is woven from the tails of horses. The horsehair from the mane is twisted into ropes and after being boiled and then dried in an oven is untwisted and in a half-matted condition employed for stuffing beds and cushions. The hair of cows is employed as a binder for plaster; in Europe it is sometimes woven into carpets, or hose. The Chinese use pig's hair for the same purposes. The stiff hair, or bristles from the ridge of the hog's back, are made into brushes, for the hair, teeth, or nails; as well as into brooms, and the larger painting and whitewashing brushes. Human hair is used for wigs, toupees and frisettes. See WIG.

Hair Pencil, in painting, a fine brush made of the hairs of the camel, sable, badger, squirrel, marten, raccoon, goat, etc. The various sizes require the quills of the crow, pigeon, goose, turkey, or swan. Hair pencils are used by artists in water colors, and by house and sign painters in fine work.

Hair-tail. See SCABBARD-FISH.

Hair-worm. See EELWORM.

Hairless Dogs. Several races of domestic dogs are bred in the warmer parts of the world, whose skins are nearly hairless. In China and Farther India a large dog of this description, called polygar, is used in hunting. Central Africa has a breed resembling a small black greyhound. A hairless dog is found mummified in prehistoric Peruvian tombs, and others were formerly prevalent in the West Indies, or is still known in Mexico. These have been cultivated by fanciers in the United States, and constitute a recognized show class. They are small and terrier-like, brownish or bluish-black, wrinkled,

MAIN STREET, PORT-AU-PRINCE, HAITI.

and have only a few straggling hairs on the body, with sometimes a tuft on the head.

Haiti, Hayti, or **Santo Domingo,** the second largest island of the West Indies, lying between Cuba and Porto Rico, the principal adjacent islands being La Gonave, at the entrance of Port-au-Prince, Tortuga Island, before Port de Paix, and Vache Island, before Cayes. The whole island is about 638 kilometres long with a surface of 75,074 square kilometres. It comprises two republics: the Republic of Haiti in the west and the Dominican Republic (q.v.) in the east, with a total population of 1,700,000. The land is very fertile, being irrigated by 47 rivers; 14 mountain chains are spread over the island. The mines are still to be worked and there is a large field for investment. Haiti is healthful. From June to September it is hot in the lowlands; but regular land and sea breezes moderate the temperature. In the mountains it is always cool. There is a dry and a wet season. There are no poisonous snakes or insects. The sanitary condition is excellent.

When, on 6 Dec. 1492, Columbus discovered Haiti, the island was divided into five states or "cacicats." The inhabitants, called Indians, had an easy life and were ruled by chiefs whose title was "cacics." The natives could not stand the hard work imposed on them by the Spaniards; they died rapidly. Then began the import from Africa of the black slaves. The Spaniards enjoyed alone their new possession until 1630, when the French adventurers known as "buccaneers" and "freebooters," after occupying Tortuga Island, undertook the conquest of what became St. Domingue.

From the intercourse between white and black, resulted in St. Domingue an intermediary class, the mulattoes. Most of the latter, on account of their relationship, were not slaves; and their black mothers, their relatives, and other slaves who could own enough money to redeem themselves, little by little obtained their freedom. These free colored people were not allowed any political rights. They at first did not resent it. They endeavored to become land-owners.

When the French Revolution broke out in 1789 these free men or "affranchis," who by that time had accumulated wealth, asked for equality of political rights. The Assemblée Nationale granted them those rights. But the French landlords or "colons" were not at all pleased to have the colored people for their fellow citizens. A hard struggle began. The "colons" called the English to their rescue.

At the end of the year 1793, the English took possession of a part of the island. St. Domingue was considered lost to France, being occupied partly by the Spaniards, partly by the English, when Toussaint Louverture (q.v.) espoused the cause of France. This extraordinary man, who, up to 40 years of age, was a slave, revealed himself a great general and a first-class statesman. He succeeded in ridding the country of the Spaniards and in expelling the English, who, after an occupation of about five years, were compelled to abandon their prey. The French government rewarded him by appointing him major-general and governor of the island. Later on, Napoleon I. thought that Toussaint Louverture was too powerful. In 1801 he appointed his brother-in-law, Gen. Leclerc, governor of St. Domingue, and sent a formidable army to reduce the authority of Louverture. Toussaint Louverture, after a few skirmishes, surrendered and retired on one of his properties. Nevertheless, Gen. Leclerc caused him to be arrested and deported to France in June 1802; to that end the French general resorted to treachery.

The colored people took up arms against the French domination in September 1802 under the leadership of Gen. Dessalines. The fight was very severe. And at the end of the year 1803, Rochambeau, who, at the death of Gen. Leclerc, was in command of the French army, hard pressed in the city of Cape Haiti by the black troops, was compelled to capitulate. And on 1 Jan. 1804 Haiti proclaimed its independence, with Gen. Dessalines as its first ruler. Slavery was abolished. Haiti was then the first country to rid humanity of such a sad practice.

In 1822 the Spanish part came under the administration of Haiti; and the whole island was ruled by one government. But in 1844 the Spanish part seceded and established an independent government, known to-day as the Dominican Republic.

The Republic of Haiti is administered by a president, elected for seven years, by the House of Representatives and the Senate assembled in "Assemblée Nationale." The president is assisted by six ministers or secretaries of state. The House of Representatives is elected by the people for three years, and the Senate is elected by the House of Representatives for six years; but every two years the third part of the Senate is renewed.

The judiciary organization consists of a supreme court (Tribunal de Cassation) of civil, criminal, correctional courts, and of justices of the peace.

Education is compulsory and gratuitous. The primary as well as the high schools are freely open to all. Haiti devotes now a sixth of its revenues to education.

French is the language of Haiti, though the country people speak a patois called "creole."

The religion of the people is Roman Catholic. There are an archbishop, three bishops, and in every commune at least a priest. The pope entertains a diplomatic representative, a legate, at Port-au-Prince, and Haiti has a minister accredited to the Holy See. Freedom of conscience is, however, guaranteed; and all cults are protected. Haitian citizens only can own real estate. Any foreigner may easily be naturalized.

Haiti produces coffee, cocoa, logwood, mahogany, and cotton; tortoise-shells, all kind of cabinet wood, hides, honey, bees-wax, etc., are also exported; for home consumption, they make sugar, rum, soap, straw hats, pottery, matches, artificial ice, etc. There is a railroad from Cape Haiti to Grande Rivière and another one from Port-au-Prince to "L'Etang." These railroads are managed by Haitian companies; so are the inland telegraph and telephone lines. The area of the Republic is estimated at 26,000 square kilometres and the population (1900) 1,294,400.

J. N. Léger,
Envoyé Extraordinare et Ministre Plénipotentiaire d'Haiti aux Etats-Unis.

Hake, Alfred Egmont, English journalist and author. He is a son of Thomas Gordon Hake (q.v.) and cousin of General C. E. Gor-

don (q.v.), whose life he has written in 'The Story of Chinese Gordon' (1883). Other works by him are: 'Paris Originals' (1878); 'Flattering Tales' (1882); 'The Unemployed Problem Solved' (1883); 'Events in the Taiping Rebellion' (1891); 'Suffering London' (1892); 'Gordon in China and the Soudan' (1896); 'Irish Finance' (1897).

Hake, Thomas Gordon, English poet and physician: b. Leeds 1809; d. London 11 Jan. 1895. He took his medical degree at Glasgow University in 1831, and practised his profession in East Anglia, later becoming the physician and friend of Dante Gabriel Rossetti. His poetry is thoroughly original, but very subtly philosophical. His works include: 'Poetic Lucubrations' (1828); 'Vates: A Prose Epic' (1839); 'Madeline with Other Poems and Parables' (1871); 'New Symbols' (1875); 'Maiden Ecstasy,' verse (1880); 'The Serpent Play, a Divine Pastoral' (1883); 'Memoirs of Eighty Years' (1892).

Hakes, Fishes of the family *Gadidæ* and chiefly of the genera *Phycis* and *Merluccius,* distinguishable from the cod and haddock by having only two dorsal fins. *Phycis* has a chin barbel and filamentous ventral fins, both of which are lacking in *Merluccius.* The squirrel-hake (*Phycis chuss*) and white hake (*P. tenuis*), both also called ling or codling, are common bottom fish on our Atlantic coast from Virginia northward. The silver hake or whiting (*Merluccius bilinearis*) has a similar range, but is less common in shallow waters and leads a roving life in search of herrings and other smaller fishes. Various other species occur in the North Atlantic and Pacific Oceans. The hake fishery is of considerable extent, and the product is salted and sold chiefly as boneless cod. The dried air-bladders are utilized in the manufacture of isinglass.

Hakim, ha-kēm', a Turkish word, signifying lord and frequently in the Koran applied to Allah, God, as in the Greek and English versions of the Jewish Scriptures the word Lord is used for Jehovah. It is now-a-days especially given as a title of honor to the imperial physician of the Sultan, who is Hakim bashi, that is to say, the chief of the physicians, always a Turk; whilst the physicians in the seraglio under him are western Europeans, Greeks and Jews.

Hakluyt, hăk'loot, **Richard,** English geographer: b. about 1553; d. London 23 Nov. 1616. He entered Christ Church College, Oxford, in 1570, and became so eminent for his acquaintance with cosmography that he was appointed public lecturer on that science. In 1582 he published a small collection of voyages and discoveries, forming the basis of a subsequent work on a larger scale. In 1584–88 he was in Paris as chaplain to Sir Edward Stafford. On his return he published (in 1589) his famous collection of 'The Principal Navigations, Voyages, and Discoveries of the English Nation, made by Sea, or over Land, within the Compass of these 1500 Years.' The first volume of a new edition of his great work was published in 1598, the second and third in 1599 and 1600. In 1602 he became prebendary, and in 1603 archdeacon, of Westminster, and next year he was appointed a chaplain of the Savoy. He was interred in Westminster Abbey. He published several other geographical works, among them 'Virginia Richly Valued, etc.' (1609), a translation from the Portuguese. An edition of his chief work appeared in 16 vols. 1885–90. The manuscript papers of Hakluyt were used by Purchas in his 'Pilgrims.'

Hakluyt Society, of Great Britain, organized in December 1846, for the purpose of printing and distributing among its members rare volumes on voyages and travels, and geographical records. Between 1847 and 1900 fully 100 volumes were issued under the editorial supervision of eminent authorities. Among these publications were: 'Select Letters of Columbus' (1849); Raleigh, 'Guiana' (1848); and 'Danish Arctic Expedition' (1897).

Halbig, Johann, yō'hän häl'bĭg, German sculptor: b. Donnersdorf, Lower Franconia, 13 July 1814; d. Munich 29 Aug. 1882. He studied at the Munich Academy, and elsewhere, finally establishing himself at Munich, where he became a professor in the Polytechnic School in 1845. His most important work is the quadriga with four colossal lions for the triumphal gateway, Munich. He also executed the Platen memorial at Ansbach, the bronze statue of Fraunhofer at Munich, the 'Emancipation' group in New York, the 'Crucifixion' group for Oberammergau, and numerous busts.

Haldeman, hâl'dē-man, **Samuel Stehman,** American naturalist: b. Locust Grove, Pa., 12 Aug. 1812; d. Chickies, Pa., 10 Sept. 1880. He was educated at Dickinson College, Pa., was professor of natural sciences at the University of Pennsylvania in 1851–5; and of comparative philology there 1869–80. He published 'Fresh-Water Univalve Mollusca of the United States' (1840); 'Zoological Contributions' (1842–3); 'Elements of Latin Pronunciation' (1851); 'Affixes in Their Origin and Application' (1865); 'Pennsylvania Dutch' (1872); 'Outlines of Etymology' (1877); 'Analytic Orthography' (1858); etc.

Hal'dimand, Sir **Frederick,** Swiss soldier in the English service: b. Canton of Neuchâtel, Switzerland, October 1718; d. Yverdun, Switzerland, 5 June 1791. He served in the army of Sardinia and in that of Prussia under Frederick the Great, later became a member of the Swiss guard at The Hague, and was there stationed when with Henry Bouquet (q.v.) he enlisted in 1756 in the British army for service in America. He organized, largely from Pennsylvania, a regiment composed of Swiss, Germans, and others and known as the 'Royal Americans,' and became its commander. In 1759 he won distinction by his successful defense of Oswego against the attack of 4,000 French and Indians, in 1767–73 commanded the garrison at Pensacola, Fla., and assisted Gage in the siege of Boston. From 1778 to 1784 he was governor of Canada, severely repressed Canadian sympathy with the Revolution, and offered an asylum to royalist refugees. His valuable official correspondence is in the possession of the British Museum. Upon his return to England actions for false imprisonment were successfully brought against him.

Hale, Charles Reuben, American Protestant Episcopal bishop: b. Lewiston, Pa., 14 March 1837; d. Cairo, Ill., 25 Dec. 1900. He

COURTESY OF THE BOOKLOVERS MAGAZINE. Copyright by Davis & Sanborn.

EDWARD EVERETT HALE.

was graduated at the University of Pennsylvania in 1858; entered the Episcopal ministry and in 1892 was made assistant bishop of Springfield, Ill., with the title of Bishop of Cairo. He was an authority upon matters pertaining to the Greek Church and his writings, all of a very scholarly cast, mainly relate to the history, liturgies and customs of that communion.

Hale, Edward Everett, American Unitarian clergyman and author: b. Boston, Mass., 3 April 1822. His father was Nathan Hale (q.v.), the first editor of the Boston *Daily Advertiser*, and the son was educated at the Boston Latin School and Harvard College. Later he studied theology and after being licensed to preach in 1842 was pastor of the Church of the Unity, Worcester, Mass., 1846–56. He then became pastor of the South Congregational Society in Boston, a Unitarian Church, and has been its pastor emeritus from 1901. In the Unitarian body he has long been one of its foremost men, and of a radical rather than a conservative type, while yet strongly loyal to the Unitarian faith. As a preacher he has always been popular, and his talents for organization have borne fruit in such humanitarian societies as the Harry Wadsworth Clubs, King's Daughters, Look Up Legions, and others. For several years he edited 'Old and New,' a magazine afterward merged in 'Scribner's Monthly,' and has edited 'Lend a Hand,' a journal of organized charity, since 1886. Since his retirement from active pastoral work he has been active in various denominational and other religious and social enterprises, and still continues to preach and lecture at frequent intervals. His 80th birthday was celebrated by a gathering in Symphony Hall, Boston, composed of representative persons from all denominations in his native city, as well as of civic and state officials, assembled to testify to the regard in which he was held, irrespective of creed or race. To Americans in general, however, he is best known as an author, and in spite of his countless clerical labors he has been one of the most voluminous of American writers. Much of his work is from necessity ephemeral in its nature, but when he has consciously wrought with an artistic end in view his level of attainment has been high. His short story, 'The Man Without a Country,' has long been accounted an American classic, and even more skilful in construction and perfect in finish, 'My Double and How he Undid Me,' and 'In His Name' have been almost equally popular. In extravaganzas like 'The Brick Moon,' such an absolute air of verisimilitude is preserved that the absurdest conceptions of the tale appear more than half credible. 'The Man Without a Country' was indeed accepted as a record of fact by many readers on its first appearance in 1863, although the theme is in its conception most improbable, and its author was obliged to state at a later date that it had no foundation in fact. The list of his published works is a long one, including nearly 70 titles and besides those already named may be cited 'Margaret Percival in America' (1850); 'Elements of Christian Doctrine' (1860); 'If, Yes, and Perhaps' (1868); 'Sybaris and Other Homes' (1869); 'The Ingham Papers' (1869); 'His Level Best and Other Stories' (1872); 'Philip Nolan's Friends' (1876); 'The Fortunes of Rachel' (1884); 'Boys' Heroes' (1886); 'Life of George Washington Studied Anew' (1887); 'They Saw a Great Light' (1889); 'The Story of Christopher Columbus' (1891); 'The Story of Massachusetts' (1891); 'The New Harry and Lucy' (1892); 'East and West or the New Ohio' (1892); 'A New England Boyhood' (1893); 'Fifty Years: Poems' (1893); 'If Jesus Came to Boston' (1894); 'Susan's Escort' (1895); 'Historic Boston' (1898); 'Lowell and His Friends' (1899); 'Memories of a Hundred Years' (1900). With his sister Susan Hale (q.v.) he has written a series of travel books entitled 'Family Flights through France, Germany, etc.,' and he has also edited numerous volumes from 'The Rosary' (1848) to 'Unpublished Essays of Emerson' (1895).

Hale, Eugene, American politician: b. Turner, Oxford County, Me., 9 June 1836. After study of law he was admitted to the bar in 1857, began practice at Ellsworth, Me., and was a member of the Maine legislature in 1867, 1868 and 1880. In 1868 he was elected representative to Congress, and in that capacity served until 1878, acting on the committee on appropriations, and during his last term being chairman of the Republican congressional committee. In 1868, 1876 and 1880 he was a delegate to the Republican national conventions of those years, in 1874 was offered the post of postmaster-general and in 1877 that of secretary of the navy, but declined both. He was a member of Grant's commission appointed for canvass of the Louisiana presidential vote in 1876. He succeeded Hannibal Hamlin in the United States Senate in 1881, and was re-elected in 1887, 1893, 1899 and 1905. In the Senate he became known as a Republican leader, interesting as a speaker and skilful in matters of legislative routine.

Hale, George Ellery, American astronomer: b. Chicago 29 June 1868. He was graduated from the Massachusetts Institute of Technology in 1890, studied also in the Harvard observatory and at Berlin, was professor of astrophysics at Beloit College in 1891–3, lecturer in astrophysics in Northwestern University, 1891–3, and was associate professor of astrophysics in the University of Chicago in 1892–7. In 1896 he became director of the Yerkes Observatory (Williams Bay, Wis.) of the university, and in 1897 professor of astrophysics. He edited the 'Astrophysical Journal' from 1895, and published papers on stellar spectroscopy and other subjects.

Hale, Horatio, American ethnologist: b. Newport, N. H., 3 May 1817; d. Clinton, Ontario, 29 Dec. 1896. He was a son of Sarah J. Hale (q.v.). He was graduated from Harvard in 1837 and the next year was appointed philologist to the government exploring expedition under Captain Wilkes, and was thus enabled to study the languages of the Pacific Islands, North and South America, Australia, and Africa. The results of his observations were published in 'Ethnography and Philology' (1846). He then studied law, was admitted to the Chicago bar, and removing to Canada in 1855 practised law at Clinton. His other works are: 'Indian Migrations as Evidenced by Language' (1883); 'The Iroquois Book of Rites' (1883); 'A Report on Blackfoot Tribes' (1885). He was classed among the foremost philologists of his

time and was a member of learned societies at home and abroad.

Hale, Irving, American soldier and electrician: b. North Bloomfield, N. Y., 28 Aug. 1861. He was graduated from the United States Military Academy in 1884, was assigned to the engineer corps, was instructor in engineering at the Military Academy in 1888–9, and in 1890 resigned from the army. He became manager of the General Electric Company for the district comprising Utah, Wyoming, Colorado, and New Mexico, with headquarters at Denver; upon the outbreak of the Spanish-American war was appointed colonel of the 1st regiment of Colorado volunteers, was promoted brigadier-general for distinguished service in the Philippines, and later brevetted major-general. In 1899 he was honorably discharged from the volunteer service. His writings include papers on electrical subjects in scientific and engineering journals and in the proceedings of the Colorado Scientific society.

Hale, John Parker, American legislator and diplomat: b. Rochester, N. H., 31 March 1806; d. Dover, N. H., 19 Nov. 1873. After graduation from Bowdoin in 1827 and study of the law at Rochester and Dover, he was admitted to the bar in 1830, in 1832 was elected a Democratic representative in the State legislature, and in 1834–41 was United States district attorney. In 1842 he was elected to Congress, where, though remaining a Democrat, he stoutly opposed the "gag-rule" which sought the exclusion of anti-slavery petitions. He was renominated; but previous to the election the annexation of Texas was made a plank of the Democratic platform, and the State legislature of New Hampshire directed its congressmen and senators to support the measure. Hale in a public statement refused to do this and the Democratic State Convention was then reassembled and his name stricken from the ticket. Hale ran as an independent Democrat, but no candidate received a majority. In 1846, after a spirited canvass known as the "Hale storm of 1845," he was elected to the lower house of the legislature, and became its speaker. In 1847 he was elected to the United States Senate, where he was the first, and, until joined by Salmon P. Chase in 1849, the only avowed anti-slavery member. He was an orator of fine abilities, and besides opposing the slave system, secured laws abolishing flogging and grog-ration in the navy. He was nominated for president by the Free-Soil Democrats in 1852, and received 157,685 votes. In 1855 he was elected to the Senate for the four years of the unexpired term of C. G. Atherton, deceased, and in 1858 for a full term. During the Civil War he supported the Lincoln administration. He was United States minister to Spain in 1865–9.

Hale, Lucretia Peabody, American author, sister of E. E. Hale (q.v.): b. Boston, Mass., 2 Sept. 1820; d. there 12 June 1900. She was very popular as a writer for young people, and in addition to 'The Lord's Supper and Its Observance' (1866); 'The Service of Sorrow' (1867); 'The Wolf at the Door' in the 'No Name Series' (1877), she published for young readers 'The Peterkin Papers' (1882), and 'The Last of the Peterkins' (1886). She also wrote 'The New Harry and Lucy' (with E. E. Hale). She will be longest remembered as the creator of the Peterkin Family, who have become widely recognized types of character.

Hale, Sir Matthew, English jurist: b. Alderley, Gloucestershire, 1 Nov. 1609; d. there 25 Dec. 1676. He was educated at Oxford and Lincoln's Inn, and is said to have studied 16 hours daily, extending his researches to natural philosophy, mathematics, history, and divinity, as well as the sciences more immediately connected with his profession. He was called to the bar before the commencement of the civil war; and in the conflict of parties which took place his moderation, accompanied as it was by personal integrity and skill in his profession, secured him the esteem of both royalists and parliamentarians in his own time. In 1654 he became a judge of the Common-bench (the former King's-bench), in which station he displayed firmness of principle sufficient to give offense to the Protector. He was a member of the parliament which restored Charles II., and one of the members most active in passing the Act of Indemnity. In 1660 he was knighted, and made chief baron of the Court of Exchequer. He was the last English judge who sanctioned the conviction of culprits for witchcraft. He was raised to the chief-justiceship of the King's-bench in 1671. After his death appeared his 'History of the Pleas of the Crown'; 'Jurisdiction of the Lords' House'; and 'The History of the Common Law of England. He also wrote several works on scientific and religious subjects.

Hale, Nathan, American revolutionary officer: b. Coventry, Conn., 6 June 1755; d. New York 22 Sept. 1776. He was graduated at Yale in 1773, and engaged as a teacher, first at East Haddam, and afterward at New London. His parents intended him for the ministry; but on the Lexington alarm in 1775 he wrote to his father, in a Connecticut regiment, saying "that a sense of duty urged him to sacrifice everything for his country," and soon after entered the army as lieutenant (1775) and in a few months was promoted to be captain (1776). While with the troops near Boston he was vigilant and faithful in every point of duty; and according to a tradition of doubtful authenticity, in September 1776, when in New York, he, with an associate, planned and effected the capture of a British sloop laden with provisions, taking her at midnight from under the guns of the man-of-war Asia, and distributing her prize goods to the American soldiers. After the retreat of the army from Long Island, when it was all-important to understand the plans of the enemy, Washington applied for a discreet and practised officer to enter the enemy's lines and procure intelligence, and Hale volunteered for the service. He passed in the disguise of a Dutch schoolmaster to the British camp and made full drawings and memoranda of all the desired information, but on his return was apprehended and taken before Howe, by whom he was ordered to execution the next morning. He was denied a Bible and the aid of a clergyman; and was hanged, saying with his last breath: "I only regret that I have but one life to lose for my country." A statue of Hale is in City Hall Park, New York. Consult the 'Life' by Johnston (1901); Holloway, 'Nathan Hale, the Martyr Hero' (1899).

Hale, Nathan, American journalist: b. West Hampton, Mass., 16 Aug. 1784; d. Brookline, Mass., 9 Feb. 1863. He was a nephew of the patriot Nathan Hale (q.v.) and father of E. E. Hale (q.v.). He was graduated from Williams College in 1804, and after studying law was admitted to the Boston bar in 1810, in 1811–4 was editor of the Boston 'Weekly Messenger,' and in 1814 purchased and became editor of the *Advertiser,* established in 1813 and the first New England daily. At first Federalist in politics, the *Advertiser* became successively Whig and Republican and was at all times very influential. In 1820 it opposed the Missouri bill, in 1854 the Kansas-Nebraska bill, and it was the first newspaper to advocate the settlement of Kansas by "Free-Soil" colonists. Hale was a founder of the 'North American Review' (1815), served at various times in both houses of the Massachusetts legislature, published a series of stereotyped maps after a method invented by himself (1830), and wrote pamphlets on topics of internal improvement.

Hale, Philip, American music critic: b. Norwich, Vt., 5 March 1854. Graduated from Yale in 1876, he was admitted to the bar in Albany (1880), studied music under Dudley Buck and later in Europe with Haupt, Bargiel, and Guilmant (1885–7), and was organist successively of Saint Peter's, Albany (1879–82), Saint John's, Troy (1887–9), and the First Unitarian Society of Roxbury, Mass. (1889). In 1889–97 he contributed music criticism to the Boston press, from 1891 was critic of the *Journal,* in 1897 became editor of the 'Musical Record,' and in 1901 of the 'Musical World.' He is known as one of the most discriminating and interesting of American writers on musical subjects.

Hale, Salma, American politician: b. Alstead, Cheshire County, N. H., 7 March 1787; d. Somerville, Mass., 19 Nov. 1866. He was early apprenticed to a printer of Walpole, N. H., in 1805 became editor of the 'Political Observer,' a Republican journal of Walpole, held various local offices, and in 1828 and 1844 was a member of the New Hampshire house of representatives, and in 1824 and 1845 of the State senate. In 1845 he was appointed secretary of the commission for the determination of the northeastern boundary line of the United States. He was elected to Congress in 1816 as a Republican (Democratic) representative, but declined a re-election. His 'History of the United States' (1821) won a prize of $400 and a gold medal, offered by the American Academy of Belles-Lettres, and appeared in many subsequent editions. He published also 'The Administration of J. Q. Adams' (1826); and 'Annals of the Town of Keene' (1826).

Hale, Sarah Josepha Buell, American author and editor: b. Newport, N. H., 24 Oct. 1788; d. Philadelphia 30 April 1879. Her husband dying in 1822 leaving her with five small children, she supported her family by literary work. She was editor of the Boston 'Ladies' Magazine' 1828–37, and when in 1837 this was consolidated with 'Godey's Lady's Book,' published in Philadelphia, she became editor of the latter also, continuing in the position for forty years. She retired from literary life in 1877. Her efforts in behalf of the Bunker Hill Monument fund, her interest in seamen, in foreign missions, and in the higher education of women, were untiring and successful. For many years she advocated the keeping of Thanksgiving Day as a national festival, as it has been observed since 1864, when President Lincoln adopted her suggestion. Her most enduring publication is 'Woman's Record: or Sketches of All Distinguished Women' (New York 1874).

Hale, Susan, American author and watercolorist: b. Boston 5 Dec. 1833. She has published 'Life and Letters of Thomas Gold Appleton' (q.v.) (1885), and with her brother, E. E. Hale (q.v.) has written the popular 'Family Flight' series of travel books for young people.

Hale, William Bayard, American writer: b. Richmond, Ind., 6 April 1869. He was graduated from Harvard and the Episcopal Theological School (Cambridge, Mass.), and was rector at Middleborough, Mass., 1892–9, and subsequently at Ardmore, Pa., retiring from the ministry in 1901. He has published 'The Making of the American Constitution'; 'The Eternal Teacher' (1895); 'The New Obedience' (1898); 'Phillips Brooks'; etc.

Hale, William Thomas, American writer: b. Liberty, Tenn., 1 Feb. 1857. He practised law for several years and has since been connected editorially with St. Louis and Tennessee journals. He has published 'Poems and Dialect Pieces' (1894); 'Showers and Sunshine,' verse (1896); 'The Backward Trail' (1899); 'An Autumn Lane and Other Poems' (1899); 'Great Southerners' (1900).

Halévy, Jacques François Fromental Elie, zhäk frän-swä frō-mōn-täl ā-lē ä-lā-vē, French composer: b. of Jewish parentage, Paris 27 May 1799; d. Nice, France, 17 March 1862. He studied counterpoint under Cherubini for five years, and in 1819 was sent to Italy to finish his education. The first of his pieces performed was a little comic opera, 'L'artisan,' given at the Théâtre Feydau, in 1827. His chef d'œuvre, 'La Juive,' appeared in 1835, and rapidly obtained a European celebrity, and has been frequently sung in the United States. Among his other works are 'L'Eclaire'; 'Guido et Ginevra'; 'La Reine de Chypre'; 'Le Val d'Andorre'; 'La Fée aux Roses.' The melodies of Halévy are always soft and flowing, the harmony correct and pleasing; but his works display on the whole more talent than genius.

Halévy, Joseph, zhō-zĕf, French Orientalist and traveler: b. Adrianople, Turkey, 15 Dec. 1827. In 1868 he traveled in Abyssinia; and for the Académie des Inscriptions he traversed (1869–70) Yemen, where he obtained copies of not less than 686 inscriptions, largely Himyaretic and Sabæan. He was appointed assistant librarian of the Asiatic Society, and adjunct-professor of Ethiopic in the Ecole des Hautes Etudes. Well known also as a Biblical critic and Assyriologist, he founded (1893) the 'Revue Sémitique d'épigraphie et d'histoire ancienne,' and published numerous works, including: 'Archæologic Mission to Yemen' (1872); 'Journey to Nedjran' (1873); 'Sabæan Studies' (1875); 'The Origin of Babylonian Civilization' (1876); 'Miscellany of Criticism and History Regarding Semitic Peoples' (1883).

Halévy, Ludovic, lü-dō-vēk, French dramatist and novelist: b. Paris, France, 1 Jan. 1834.

He is a nephew of J. Halévy (q.v.) and, unsuccessful at first, he finally worked his way into public favor, especially after associating his pen with that of Henri Meilhac. In collaboration with the latter, he wrote many of the librettos of Offenbach's most brilliant and satiric operettas, including 'The Perichole,' 'The Brigands,' the 'Belle Hélène,' and 'The Grand Duchess of Gérolstein.' Several serious librettos of high excellence are from the same hands, including that for Bizet's 'Carmen.' In spoken drama, Frou-Frou' and 'Tricoche and Cacolet' are among the most popular plays the two dramatists produced together. In 1881 he ceased writing for the stage, and turned to fiction. 'L'Abbé Constantin,' the first of his novels, is also the most popular, and opened to him the French Academy. It was for more than one season the French story of the day. It is a charming story, full of fresh air and sun, simply and skilfully told. It presented a view of American character and temperament not usual in French fiction; and irreproachable in its moral tone, has become a sort of classic for American schools and colleges. 'La Famille Cardinal' (The Cardinal Family) and 'Crichette' are studies in fiction of aspects of Parisian life. 'Notes and Souvenirs' embody observations during the Prussian invasion of 1871. They are interesting, as giving faithful pictures of the temper of the people during those days. Among his short stories, 'Un Mariage d'Amour' (A Marriage for Love) is one of the best.

Half Blood, in law, the relationship of persons born of the same father but not of the same mother, which is called a consanguinean relation; or of those born of the same mother but not of the same father, which is termed uterine. In the succession to real or landed property a kinsman of the half blood inherits next after a kinsman of the whole blood in the same degree, and after the issue of such kinsman when the common ancestor is a male, but next after the common ancestor when such ancestor is a female. So that brothers consanguinean inherit next after the sisters of the whole blood and their issue; and brothers uterine inherit next after the mother.

Half-breeds, the children of parents of different races; a term usually confined to whites and American Indians. There are two tribes of Indian half-breeds, at Red River Settlement, chiefly employed in agriculture and hunting. The rise of independent half-breed tribes is "the first step toward the evolution of a distinct race."

Half-caste, a person born of a European father and a Hindu or Mohammedan mother, or more rarely of a Hindu or Mohammedan father and a European mother; an East Indian.

Half-crown, a British silver coin of the value of two shillings and sixpence (60 cents).

Half-dollar, a silver coin of the United States of the value of 50 cents. Authorized in April 1792, its coinage at a weight of 208 grains was begun in 1794; its issue was suspended from 1798 to 1800 inclusive and in 1816. In 1853 its weight was reduced to 192 grains. The half-dollar is legal tender to the amount of ten dollars.

Half-eagle, a gold coin of the United States of the value of five dollars, so called from the national emblematic bird which figures upon the reverse. Authorized in 1792 the coinage was begun in July 1795; there was no issue in 1816 and 1817.

Half-King, the name given by the English to a Seneca Indian, chieftain of an Ohio tribe, who accompanied Washington during his expeditions in 1753–54, and was present at the defeat of the French at Great Meadows. His summary of the prowess of the respective combatants was that "the English acted like fools and the French like cowards."

Half Moon, the name of the vessel commissioned by the Dutch East India Company in 1609, and commanded by Henry Hudson for a voyage of exploration in search of a Northwest Passage. In this ship he entered New York Bay and explored the river which bears his name.

Half-tones, pictures produced by printing from plates made by the half-tone process, which will here be described. Except that used in line-drawing, until early in the eighties there was no process by which paintings, wash-drawings, or photographs could be done into the form of a surface printing-block for the press, and the introduction then of the half-tone block marked a revolution in the history of photographic illustration. The development of the process was the result of a kind of evolution of Bullock's (1866). Meisenbach of Munich patented a half-tone process in 1882.

The American Frederic Eugene Ives and others have since experimented and published results, and by them within a few years the process as it now exists was practically established. Americans were first in the field with an improved device for breaking up the image into dots, which was so much superior to anything invented in Europe that almost every other method was dropped in its favor. The diamond-ruled screen, which was introduced in this country by Max Levy, is essential to advanced work in half-tone. To make one of the screens, a sheet of the finest plate-glass is coated with a varnish of asphalt and wax, and placed on the bed of an automatic ruling-machine capable of ruling lines of any fineness up to 500 to the inch. The cutter is diamond-pointed and gauged to cut lines of any desired width. The lines are ruled diagonally at 45° across the glass, the number to the inch varying as required. The ruled surface is treated with hydrofluoric acid, which eats into or etches the lines laid bare by the diamond and forms a channel which is filled up with an opaque pigment. This enamel is baked in the lines in an oven, and then the surface is polished until the lines are perfectly level and the spaces represented by the clear glass are bright and transparent. Two of these ruled glasses are required for each screen, laid together with the lines crossing at right angles and cemented with Canada balsam.

To produce a half-tone block from a picture, wash-drawing, or photograph, this ruled grating is placed in front of the sensitive plate, not in contact with it, but at a distance which must be nicely determined by experience. Everything is represented by dots so accurately graded in relation to the light and shade of the original that the eye scarcely detects them, and the half-tone picture appears as a practical *facsimile* of the original from which it was photographed.

Most half-tone blocks are now etched on copper, and the sensitizing solution generally employed for this metal is a compound of fish-glue, albumen, chromic acid, water, and bichromate of ammonia. The copper is cleaned with tripoli and washed: the sensitizing solution is flowed over it two or three times; it is placed on a revolving table and rapidly whirled to spread the coating thinly and evenly; the coating is dried by gentle heat in a yellow-lighted room, and the plate is now ready for exposure under the half-tone negative. Three to ten minutes' exposure to an electric arc-light completes the printing, then the plate is given a bath in cold water, and is soaked and washed under a spray of water until the compound not acted upon is dissolved out. The image on the metal at this stage is almost invisible. To facilitate an examination of the film, the plate is dipped into a solution of methyl-violet, which stains the film and brings the picture into view. If all is right, the surface is dried either by flowing it with methylated alcohol or by gentle heat. The next operation is the hardening of the glue-picture into a substance resembling enamel — hence the "enameline process." The plate is highly heated over the flame of a large Bunsen burner; during the progress of this "burning in" or enameling, the blue picture gets pale, then gray, and vanishes; as the plate gets hotter, the image appears as a faint brown, and increases in strength to a rich chestnut-brown tint, when the heat must be withdrawn, and the plate cooled off. The plate has now upon it a picture formed of a strong, hard, impermeable coat of enamel which will bear any reasonable etching without further protection.

The etching-bath is made up of neutral perchloride of iron dissolved in water, and of a strength which registers 35° with a Baumé's hydrometer. The plate is first subjected to a general etching, so that it may be inked over with a printer's roller, and a first proof of the photo-etched picture be pulled in the press. The dulling of the general effect caused by the interposition of the necessary screen-grating has to be removed as far as possible, and this is done by artists who are specially trained for the work. The parts of the picture which are in shadow and are usually correctly rendered by a properly exposed negative are covered over with varnish, and the next tones are etched again; then these tones are covered up and the high lights are treated until the resulting picture, when proofed, correctly represents the original. The plates are then trimmed by engravers, beveled to admit of being riveted to the wood-mounts, and are mounted type-high for use in the printing-press.

Invention and experiment are now active toward the next great step in half-tone work, the production of surfaces without the mechanical smoothness hitherto so persistent. What is aimed at is the making of pictures which are free from mechanical effect, and are yet sufficiently delicate in texture to retain the finer details.

Half-way Covenant, a concession in church requirements made by the New England Synod convened at Northampton in 1657, whereby persons who had been baptized in their infancy, who assented to the doctrines of faith, entered into covenant with the church, and led decent and respectable lives, were admitted to the privileges and prerogatives of church-membership with the exception of the Lord's Supper, although they might give no evidence of conversion and had neither the ability nor willingness to make profession of religious experience. This "half-way covenant" as it came to be called aroused bitter controversy which did not die out until the 19th century; among its most strenuous opponents were Jonathan Edwards and his followers. The contention is baseless that it entailed certain civil privileges in relation to the State franchise, its chief aim being to admit children to baptism and to transmit to them the same degree of church membership as their parents. Consult Walker, 'Creeds and Platforms of Congregationalism' (1893).

Haliburton, hăl'ĭ-bėr-tȯn, **Thomas Chandler,** Canadian humorist: b. Windsor, Nova Scotia, December 1796; d. Isleworth, near London, 27 Aug. 1865. He practised law in Halifax, and in 1842 became judge of the supreme court of Nova Scotia, but subsequently gave up his profession, and went to live permanently in England. His first work was a 'Historical and Statistical Account of Nova Scotia' (1829). In 1835 he contributed a series of letters to a Halifax newspaper, under the pseudonym of "Sam Slick," clock-peddler. These were published with considerable alterations and additions, in a collected form in 1837, under the title of 'The Clockmaker, or Sayings and Doings of Samuel Slick of Slickville,' and became very popular. A second series followed in 1838, and a third in 1840. In 'The Attaché, or Sam Slick in England,' his hero is represented as attaché of the American embassy at the court of St. James, and again appears in 'Sam Slick's Traits of American Humor' (1852). Another work of his of some importance is 'Rule and Misrule of the English in America' (1851). In 1859 Haliburton was elected member of parliament for Launceston.

Hal'ibut, the largest of the flat fishes (*Hippoglossus vulgaris*), and one of the most important and highly prized food-fishes. It occurs in all Northern waters, south to France, New York and San Francisco. It reaches a weight of 400 pounds, and is characterized by having the eyes on the right side, the ventral fins and mouth symmetrical, and the lateral line arched in front. It is dark brown on the right side, and white on the left or lower side. It was formerly very abundant along the whole eastern coast of the United States, at times proving a nuisance from its numbers to the cod-fishers. It has gradually become scarcer, and at the same time the appreciation of it as a food-fish has increased, so that the halibut fishers have gone farther and farther for it until now a good proportion of the catch comes from the waters around Iceland. A second species, the Greenland halibut (*Reinhardtius hippoglossoides*) occurs in the Arctic Atlantic, but is not very common. It is yellowish brown and has a straight lateral line. In the trade this is not distinguished from the common species. Halibut are taken with hook and line (or trawls) using fresh fish (herring, etc.) for bait.

Hal'ifax, Charles Montague, Earl of, English politician: b. Horton, Northamptonshire, 16 April 1661; d. 19 May 1715. He first attracted notice by his verses on the death of Charles II.;

and in 1687, in conjunction with Matthew Prior, wrote 'The Town and Country Mouse,' a parody on Dryden's 'Hind and Panther.' He became a lord of the treasury in March 1692, in 1694 was made chancellor of the exchequer; in 1695 carried out the much needed re-coinage, appointing Newton warden of the mint; and in 1696 he devised the system of exchequer bills. His administration was distinguished by the adoption of the funding system, and by the establishment of the Bank of England. In 1700 he was raised to the peerage, under the title of Baron Halifax. In the reign of Anne he remained out of office, but he actively exerted himself to promote the union with Scotland, and the Hanoverian succession. George I. created him an earl, and bestowed on him the order of the Garter. The 'Life and Miscellaneous Works of Lord Halifax' were published in 1715, and his poems were included in the edition of 'English Poets' by Dr. Johnson.

Halifax, Canada, the capital of the province of Nova Scotia, and county-seat of Halifax County, a city and port of entry on Halifax Harbor, on the Intercolonial and Dominion, and Canadian Pacific R.R.'s. The harbor, originally known as Chebucto, "chief of havens," is one of the best in the world. It is 16 miles long from north to south, with an average width of a mile, and terminates in Bedford Basin, a beautiful sheet of water four miles wide, affording 10 square miles of safe anchorage. The North West Arm, an inlet on the west of the city, is a charming bay, on the shores of which are many of the villa residences of the wealthier Haligonians. The harbor is protected by 11 forts and batteries. A citadel crowns the hill, on the slopes and at the base of which the town is built. The streets are regularly laid out on a rectangular plan, are lighted by gas and electricity, and have electric street-car lines. The public buildings are built chiefly of freestone; the houses of wood. The most notable structures include Government House, the official residence of the lieutenant-governor, the armories, the post-office, the custom-house, the Province building, court-house, city-hall, Masonic Temple, Academy of Music, the Admiralty House, the Wellington barracks, several hospitals, and other charitable institutions, the Roman Catholic and Anglican cathedrals, and Saint Paul's church, the oldest Protestant church building in British North America. Among the higher educational institutions are the non-sectarian Dalhousie University and College (q.v.), the Roman Catholic College of Saint Mary, the Presbyterian Theological College, the Halifax Ladies' College and Conservatory of Music, and a high school. The city maintains a free library, an excellent waterworks system, and fine parks, including Point Pleasant Park, and the handsome public gardens covering 17 acres. Halifax is the chief British naval station in North America, and has extensive dockyards; besides Esquimalt it is the only military post in Canada garrisoned by British imperial troops; in 1901 the garrison amounted to 1,784 soldiers. Halifax has railroad communications with all parts of the Dominion and the United States, and steamship lines connecting with Great Britain, the West Indies, Boston, and New York. A United States consul-general is resident in Halifax. The chief occupations of the inhabitants are commerce and fisheries. The city has considerable West Indian trade, exporting lumber, fish, and agricultural products, and importing sugar, rum, molasses, and other sub-tropical products; most of the commerce of the province is carried on through Halifax. The principal manufactures are iron castings, machinery, agricultural implements, nails, paints, gunpowder, cordage, leather, boots and shoes, clothing, soap and candles, cotton and woolen goods, and woodenware; there are also sugar refineries, distilleries, and breweries.

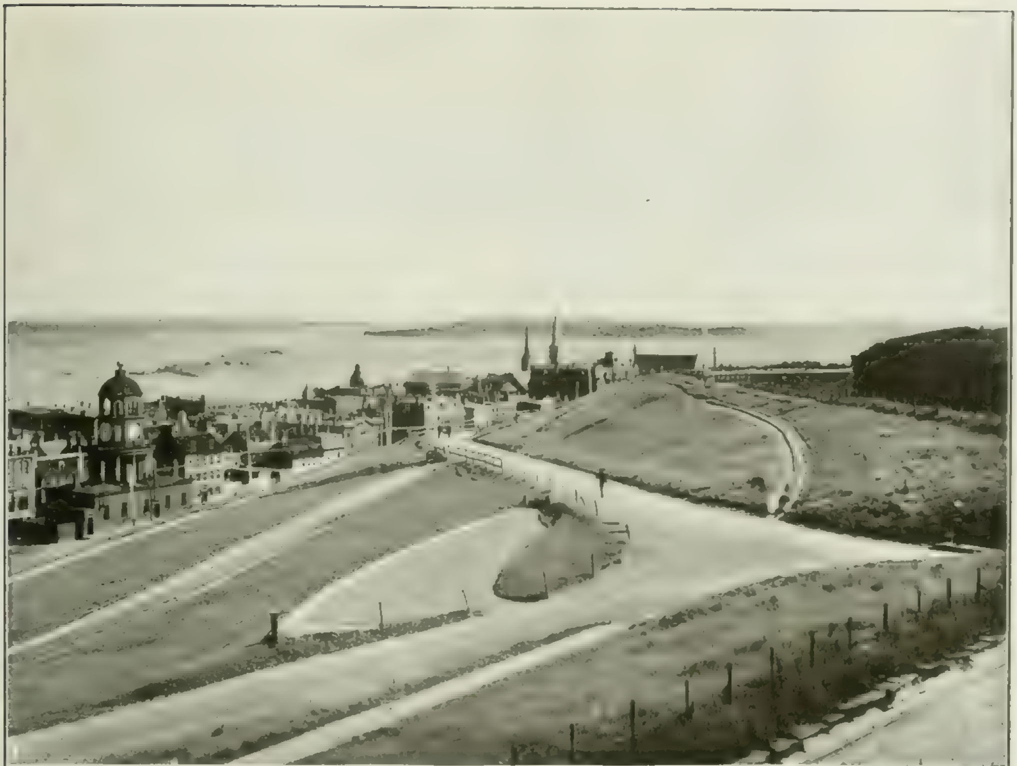
Halifax was founded in 1749 by the Hon. Edward Cornwallis, and named in honor of the Earl of Halifax. The following year it was made the capital of Nova Scotia, then including New Brunswick, in place of Annapolis; in 1817 it was declared a free port; in 1842 it was incorporated as a city. It is governed by a mayor, elected annually, and by 18 aldermen, elected triennially. The city and county send two members to the Canadian House of Commons, and three to the Provincial Legislature. Pop. (1901) 40,832.

John Forrest,
President Dalhousie College.

Halifax Commission, the designation for the commission of representatives of Great Britain and the United States which met at Halifax, Nova Scotia, in 1877, to determine the amount of compensation to be paid by the United States for the privileges which under the provisions of the fisheries treaty of 1871 between the two countries, had allowed the fishermen of the United States to take fish along the shores of Canada and Newfoundland. The great value of the British fishing waters was admitted and the sum of $5,500,000 was awarded Great Britain. The ten-year treaty which went into operation in 1873 was terminated by the U. S. government in 1885, and an attempt to renew it by the Chamberlain-Bayard Treaty in 1888 was frustrated by the rejection of the United States Senate. A *modus vivendi,* however, was arranged for, which the Dominion Parliament enacted as a law in 1890.

Hal'ite, the mineralogical name for native common salt, rock salt, or sodium chlorid, NaCl. Halite crystallizes in the isometric system, usually in cubes. It has a hardness of 2.5, and a specific gravity of 2.135 when pure, though it often occurs mixed with calcium sulphate, and with the chlorids of calcium and magnesium, the specific gravity being modified accordingly. Halite is usually colorless or white, though it is sometimes colored by impurities. Its refractive index for yellow sodium light is 1.5442, and transparent crystals of it are used somewhat in the manufacture of prisms and lenses, since the mineral is far more transparent than glass to the infra-red rays of the spectrum. Tyndall made extensive use of it in this way, for example, in his researches on radiant heat. (Consult his 'Contributions to Molecular Physics in the Domain of Radiant heat.') See Salt; Sodium.

Hall, Alexander Wilford, American editor and author: b. Bath, N. Y., 18 Aug. 1819. He became known as an evangelist, especially through attacks on Universalist doctrine and the theory of evolution as presented by Darwin, Huxley, and Haeckel. In 1881 he established



1. City of Halifax from the Citadel 2. North West Arm

ASAPH HALL,

PROFESSOR OF ASTRONOMY, HARVARD UNIVERSITY.

'The Microcosm,' and in 1893 became president of the Society for Philosophical Research. In 1891 he was elected fellow of the Philosophical Society of Great Britain. His works include: 'Universalism Against Itself'; 'The Problem of Human Life'; 'The Immortality of the Soul'; and 'The Hygienic Secret of Health.'

Hall, Anna Maria Fielding, British novelist: b. Dublin, Ireland, 6 Jan. 1800; d. East Moulsey, Surrey, England, 30 Jan. 1881. In her 15th year she went to London, where she was married to the well known writer, S. C. Hall (q.v.). She published 'Sketches of Irish Character' (1828); 'The Buccaneer' (1832); 'Tales of Woman's Trials' (1834); 'The Outlaw' (1835); 'The French Refugee,' a drama; 'Uncle Horace' (1837); 'Lights and Shadows of Irish Character' (1838); 'Marian' (1839); 'Midsummer Eve' (1843); 'The Whiteboy' (1845); etc. Her 'Stories of the Irish Peasantry' appeared originally in 'Chambers's Journal.' Besides assisting her husband in writing 'Ireland: its Scenery, etc.' (1841-3) and other works, she assisted in the establishment of a hospital for consumptives, and the Nightingale Fund, which resulted in the endowment of a training-school for nurses.

Hall, Arthur Crawshay Alliston, American Protestant Episcopal bishop: b. Benfield, Berkshire, England, 12 April 1847. He was graduated from Christ Church, Oxford, in 1869, took orders, entered the Society of St. John the Evangelist (Cowley Fathers), in 1874 became assistant minister of the Church of the Advent, Boston, and from 1882 to 1891 was there minister of the mission church of St. John the Evangelist. In 1894 he was consecrated bishop of Vermont, after release from the Cowley order. His publications include: 'Confession and the Lambeth Conference' (1879); 'Meditations on the Creed' (1880); 'Meditations on the Collects' (1887); and other doctrinal and devotional works.

Hall, Asaph, American astronomer: b. Goshen, Litchfield County, Conn., 15 Oct. 1829. He learned the carpenter trade but after private study attended Central College, McGrawville, N. Y., in 1854-5, was for a term a pupil of Francis Brünnow at the University of Michigan, taught at Shalersville, Ohio, and later was appointed assistant to Bond in the Harvard observatory. He became assistant in the Naval Observatory at Washington in 1862, and in 1863 professor of mathematics in the navy, with relative rank of captain. He continued in the government service until 1891, when he was retired on account of age, with relative rank of captain. While at the Naval Observatory, he was despatched on several expeditions, including those for observation of solar eclipses to Bering Strait in 1869, to Sicily in 1870, and to Colorado in 1878. He was also in charge of the American party sent to observe the transit of Venus at Vladivostock, Siberia, in 1874, and chief astronomer of the expedition to San Antonio, Tex., for the transit of 1882. Among his many discoveries the most important is that of the moons of Mars (August 1877), which he named Deimos and Phobos, and whose orbits he calculated. Among his later work is a valuable study of double stars. In 1895-1901 he was professor of astronomy at Harvard. He received the Lalande prize of the French Academy of Sciences in 1878, its Arago medal in 1895, and the gold medal of the Royal Astronomical Society in 1879. In 1902 he was president of the American Association for the Advancement of Science.

Hall, Basil, British naval officer and writer: b. Edinburgh 31 Dec. 1788; d. Portsmouth, England, 11 Sept. 1844. He entered the navy in 1802, accompanied Lord Amherst's expedition to China in 1815, a trip which supplied him with the materials of his first work, 'A Voyage of Discovery to the West Coast of Corea, and the great Loo Choo Island in the Japan Sea.' This work, first published in 1818, had a very extensive circulation. In 1827 he made a tour in Canada and the United States, and published his 'Travels in North America' (1829), a work which excited much adverse criticism in the United States by reason of its outspoken and somewhat supercilious comments and observations. 'Fragments of Voyages and Travels' appeared in 1831-33, and was followed by 'Schloss Hainfield, or a Winter in Styria' and 'Patchwork' (1841).

Hall, Bolton, American lawyer and lecturer: b. Ireland 1854. A son of John Hall (q.v.), he was graduated from Princeton in 1875, became known as a writer and lecturer in connection with various reforms, and has been identified with the University extension movement. Among the causes advocated by him are the cultivation of vacant lots by the unemployed, and the restoration of the land to the people. His publications include: 'Even as You and I.'

Hall, Charles Cuthbert, American Presbyterian clergyman: b. New York 3 Sept. 1852. He was graduated from Williams College in 1872, studied theology at the Union Theological Seminary 1872-3, and at the Presbyterian College in London and the Free Church College, Edinburgh. He was pastor of the Presbyterian Church, Newburg, N. Y., 1875-7, and of the 1st Presbyterian Church, Brooklyn, N. Y., 1877-97. In the year last named he was elected president of Union Theological Seminary. He has published 'Into His Marvellous Light: Studies in Life and Belief' (1891); 'Does God Send Trouble?' (1894); 'The Children, the Church and the Communion' (1895); 'The Gospel of the Divine Sacrifice' (1896).

Hall, Charles Francis, American Arctic explorer: b. Rochester, N. Y., in 1821; d. Thank God Harbor, Greenland, 8 Nov. 1871. Becoming interested in the fate of the Franklin expedition, he devoted his leisure to gathering information about Arctic America, and made two search expeditions, in 1860-2 and 1864-9, living alone among the Eskimo, and bringing back relics of the Franklin expedition and the supposed bones of one of Franklin's company. Natives whom he encountered in 1869 near the southern shore of King William Land gave him a report of the fate of 79 of the 105 who perished by starvation in that region. He thus contributed much to the details of the expedition's final history. In 1871 he sailed in command of the government ship 'Polaris,' on an expedition to the North Pole. On 29 August he reached 82° 11′ N., at that date the highest north latitude ever reached. Then turning south he went into winter quarters at Thank God Harbor, Greenland (81° 38′ N.). Here he was taken suddenly ill, and died. Over his grave a grateful epitaph was placed by the British polar expedition in 1876. His compan-

ions left Thank God Harbor in August, 1872, but in October, through the ice-anchor slipping, 19 men were left with stores on a floe, and only after five months of severe sufferings were they rescued by a sealer off the Labrador coast in the following April. The 'Polaris' drifted to the coast of Greenland, at a point not far south of Smith Sound, and thence in the spring the party set out in boats and was rescued by the Scotch whaler 'Ravenscraig,' off Cape York. Among the valuable results of Hall's work were the exploration of Kennedy channel, the discovery of Robeson Channel and Hall Basin, and the extension of Greenland and Grinnell Land 1½° N. Hall was less a scientist than a fearless and resourceful explorer. He published 'Arctic Researches, and Life among the Esquimaux' (1864); and mainly from his papers was compiled the 'Narrative of the Second Arctic Expedition' (1879).

Hall, Charles Winslow, American lawyer and author: b. Chelsea, Mass., 2 Nov. 1843. He was admitted to the Suffolk bar in 1866 and besides editing various New England journals has written: 'Arctic Rovings' (1861); 'Twice Taken' (1867); 'Adrift in the Icefields' (1877); 'Drifting Round the World' (1881); 'Legends of the Gulf'; 'Cartegena, or the Last Brigade'; 'Regiments and Armories of Massachusetts.'

Hall, Chester Moor, English inventor: b. Leigh, Essex, England, 9 Dec. 1703; d. Sutton, Essex, 17 March 1771. He was a large landowner in Essex, and convinced from study of the human eye that achromatic lenses were possible, he discovered two varieties of suitable glass in 1729, and in 1733 made several telescopes later declared by experts to be achromatic. Indifferent to his claims of priority, he did not appear at the trial of Dollond *v.* Champness. Later his invention of the achromatic telescope in the year 1733 was adjudged by Lord Mansfield conclusively proven.

Hall, Christopher Newman, English Congregational clergyman: b. Maidstone, England, 22 May 1816; d. London 18 Feb. 1902. He was educated at Highbury College and ordained in 1842, his first charge being at Hull. In 1854 he was made pastor of Surrey Chapel, Blackfriar's Road, London, from which place he moved with his congregation into Christ Church, Westminster Bridge Road, erected mainly through his exertions, and of which he became pastor emeritus in 1893. During the Civil War he did much by tongue and pen to give his countrymen correct ideas of the nature of the struggle in the United States. In 1865 he visited this country and again in 1873 when he delivered lectures in the principal cities. He was the author of 'The Christian Philosopher'; 'Land of the Forum and the Vatican'; 'Lectures in America'; and of a famous tract 'Come to Jesus' (1840) of which millions of copies have been issued, etc.

Hall, Edward Henry, American Unitarian clergyman and author: b. Cincinnati, Ohio, 16 April 1831. He was graduated from Harvard in 1851, ordained to the Unitarian ministry in 1859, and was pastor at Plymouth, Mass., 1859–67; Worcester, Mass., 1869–82; and at Cambridge, Mass., 1882–93. His writings include, besides a volume of 'Discourses'; 'Orthodoxy and Heresy in the Christian Church'; 'Lessons on the Life of St. Paul'; 'Papias and his Contemporaries: a Study of Religious Thought in the 2d Century' (1899).

Hall, Fitzedward, American philologist: b. Troy, N. Y., 21 March 1825; d. Marlesford, England, 1 Feb. 1901. He was graduated from Harvard in 1846; spent many years in India; made a thorough study of its tongues, and contributed to its local journals original translations and original articles. In 1850 he became tutor, in 1853 professor, in the government college at Benares; in 1855 was transferred to Ajmere as inspector of schools for Ajmere and Maiwara; and in 1856 to a like post in the Central provinces. In 1862–79 he was professor of Sanskrit, Hindustani, and Indian jurisprudence in King's College, London; in 1864 became examiner in Hindustani and Hindu to the civil-service commission; in 1880 examiner in Sanskrit to succeed Max Müller; and in 1887 also examiner in English. He was the first American to edit a Sanskrit text—'The Atmabodha, with its Commentary, and the Tattvabodha' (1852). He prepared also an edition of the 'Vishnupurâna,' containing numerous quotations from manuscripts owned by him; and editions of many other Sanskrit books. His collection of 1,000 Oriental manuscripts and 1,000 works on special subjects, he gave to Harvard. He wrote further: 'Modern English' (1873), 'Doctor Indoctus' (1880), and other works on English philology, and contributed to the 'New Oxford Dictionary.'

Hall, Florence Marion Howe, American author and lecturer: b. Boston 25 Aug. 1845. She is a daughter of Julia Ward Howe (q.v.). Prominent in the women's club movement, she became vice-president of the General Federation of Women's Clubs, and chairman of the educational department of the New Jersey State federation of women's clubs. In 1893–1900 she was president of the New Jersey Women's Suffrage Association. Her writings are: 'Social Customs' (1887); 'The Correct Thing' (1888).

Hall, Francis J., American Episcopal theologian: b. 24 Jan. 1856. He was graduated from Racine College, Wis., and the General Theological Seminary, New York, and has been professor of dogmatic theology in the Western Theological Seminary from 1886. He has published 'Theological Outlines' (1892–5); 'Historical Position of the Episcopal Church' (1896); 'The Kenotic Theory' (1898).

Hall, George Henry, American artist: b. Boston 1825. He studied art at Düsseldorf, Paris, and Rome; established his studio in New York; and became known as a still-life and figure painter. In 1868 he was elected a national academician. Among his works are 'April Showers'; 'Studies of Grapes'; 'The Seasons'; and 'Bric-a-Brac of Damascus'.

Hall, Gertrude, American writer: b. Boston 8 Sept. 1863. She has written 'Far from To-day,' a collection of short stories; 'Allegretto,' a book of verse; 'Foam on the Sea, and Other Tales'; 'The Hundred and Other Stories' (1898); 'The Age of Fairy Gold,' verse (1899); 'April's Sowing' (1900). Her work, both in verse and prose, is distinctively original.

Hall, Gordon, American missionary at Bombay: b. Tolland, Mass., 8 April 1784; d. Bombay 20 March 1826. He was graduated at

Williams College in 1808 and having studied theology, offered himself as a missionary to the American board of commissioners for foreign missions. Ordained at Salem in February 1812, he sailed the same month for Calcutta and arriving at Bombay in 1813, spent 13 years in missionary labors. No missionary in western India has been more respected among the Brahmins and higher classes than he. Beside publishing several missionary tracts he revised the Mahratta New Testament.

Hall, Granville Stanley, American psychologist and college president: b. Ashfield, Mass., 6 May 1845. He was graduated from Williams College in 1867, studied also at Berlin, Bonn, Heidelberg, and Leipsic, was professor of psychology in Antioch College (Ohio) in 1872–6, and lecturer on psychology at Harvard and Williams in 1880–1. From 1881 to 1888 he was professor of psychology in the Johns Hopkins University; and in 1888 became president of Clark University, then newly founded at Worcester, Mass., and professor of psychology in the institution. He soon became known as an authority on education and a leader in the «new psychology.» As editor of the 'Pædagogical Seminary' and the 'American Journal of Psychology,' he published: 'Aspects of German Culture' (1881); 'Hints toward a Select and Descriptive Bibliography of Education' with Mansfield (1886); 'Methods of Teaching History'; 'How to Teach Reading'; etc.

Hall, Isaac Hollister, American Oriental scholar: b. Norwalk, Conn., 12 Dec. 1837; d. Mount Vernon, N. Y., 2 July 1896. Graduated from Hamilton College in 1859, he was there tutor until 1863, in 1865 was graduated from the Columbia Law School, and until 1875 was a practitioner in New York. In 1875–7 he was professor in the Syrian Protestant College at Beirut, and later at Cyprus aided Gen. di Cesnola, then United States consul, in the arrangement of the Cypriote collection now in the Metropolitan Museum of New York. From 1884 until his death he was curator of sculpture and archæology in the Metropolitan Museum. He also lectured on New Testament Greek at the Johns Hopkins University; published (1884) an account, with facsimile pages, of the Syrian manuscripts of the Gospels, Acts, and the larger part of the Epistles, discovered by him (1876) at Beirut; and compiled a 'Critical Bibliography of the Greek New Testament' (1884).

Hall, Sir James, English geologist and chemist: b. 1761; d. Edinburgh 23 June 1832. Early interested in geological questions, he made the acquaintance of James Hutton (q.v.) and Playfair, and himself states that he came to adopt Hutton's system after three years of almost daily discussion with its founder. In the examination of this system, whose leading principle explains the conformation of the earth's crust by the action of constant natural changes, he traveled in Scotland, the Alps, Italy, and Sicily. Hall was the first geologist directly to apply chemical laboratory tests to the hypotheses of geology, but published no results of his work in this field until after the death (1797) of Hutton who objected to the judgment of the vast operations of nature through «having kindled a fire and looked into the bottom of a little crucible.» He was elected president of the Royal Society of Edinburgh, invented a machine for the regulation of high temperatures, and in 1807–12 represented Michael (or Mitchell), Cornwall, in Parliament. He wrote various scientific memoirs.

Hall, James, American lawyer and author: b. Philadelphia 19 Aug. 1793; d. near Cincinnati, Ohio, 5 July 1868. He served in the army 1812–18, and subsequently studying law became judge of the circuit court of Illinois, and also State treasurer. In 1833 he took up his residence in Cincinnati, and devoted himself to banking and literature. His chief works are: 'Legends of the West'; 'Harpe's Head, a Legend of Kentucky' (1833); 'Sketches of the West' (1835); 'Tales of the Border' (1835); 'Notes on the Western States' (1838); 'History of the Indian Tribes' (1838–44) with McKenney; 'The Wilderness and the War-Path' (1845); 'Romance of Western History' (1859).

Hall, James, American geologist and palæontologist: b. Hingham, Mass., 12 Sept. 1811; d. near Bethlehem, N. H., 7 Aug. 1898. He studied at the Rensselaer Polytechnic School for six years, and was subsequently professor of geology there, and in 1837 was appointed to a position on the New York Geological Survey. In 1855 he was appointed State geologist of Iowa. In 1850 he was elected by the Royal Geographical Society of London one of its 50 foreign members, and in 1858 received the Wollaston Medal from that scientific body. He was a distinguished member of many scientific societies at home and abroad and was held in the highest esteem for his attainments in geology and palæontology. Among his publications may be named 'Geology of New York' (1843); 'Palæontology of New York' (1847 *et seq.*); 'Graptolites of the Quebec Group' (1865); as well as parts of the Geological Reports of Iowa (1858–9); and Wisconsin (1862).

Hall, John, American Presbyterian clergyman: b. near Armagh, Ireland, 31 July 1829; d. Bangor, County Down, Ireland, 17 Sept. 1898. He was educated at Belfast College and after holding several pastorates in Ireland, in 1867 became pastor of the Fifth Avenue Presbyterian Church, New York. He was chancellor of the University of the City of New York 1882–90, and was also trustee of Princeton University, Union Theological Seminary, and of Wellesley College. He was noted for his simple eloquence and impressive sincerity and was one of the most prominent clergymen in his denomination. He wrote 'Family Prayers for Four Weeks' (1868); 'Papers for Home Reading' (1871); 'Questions of the Day' (1873); 'God's Word through Preaching' (1875); 'Foundation-Stones for Young Builders' (1879); 'A Christian Home: how to Make and how to Maintain It' (1883).

Hall, John M., American railroad president: b. Willimantic, Conn., 16 Oct. 1841; d. New Haven, Conn., 27 Jan. 1905. He was graduated from Yale in 1866 and from the Columbia Law School in 1868. He took up the practice of law in his native town and became a judge of the superior court in 1889, resigning in 1893 to become vice-president of the New York, New Haven and Hartford Railroad Company. On the death of President Clark in 1899, Judge Hall succeeded him as president.

Hall, Joseph, English prelate: b. near Ashby-de-la-Zouch, Leicestershire, 1 July 1574; d. near Norwich 8 Sept. 1656. While yet in college he published his 'Virgidemiarum,' a series of poetical satires, remarkable for elegant and energetic versification, strong and lively coloring, and masterly traces of genuine humor. Having taken orders he obtained the rectory of Halsted, near St. Edmund's Bury, where he published a very popular work, 'A Century of Meditations.' In 1617 he became dean of Worcester, and was raised to the see of Exeter in 1627. After the open rupture between the king and Parliament, he came forward in defense of the liturgy and discipline of the church, against the views which the leading Nonconformists had published, in a treatise called, after the initials of the names of its authors, 'Smectymnuus' (q.v.). In the end of 1641 Bishop Hall was translated from the see of Exeter to that of Norwich, but was later imprisoned in the Tower with the other prelates who had protested against their expulsion from the House of Peers. In 1643 he was specially named in the ordinance passed for sequestering what were called "notorious delinquents." His prose works edited by Philip Wynter were published in 1863. Among the latter, the best known and most popular is his 'Contemplations,' which still finds many readers.

Hall, Lyman, American patriot: b. Wallingford, Conn., 12 April 1724; d. Burke County, Ga., 19 Oct. 1790. He was graduated from Yale in 1747, studied medicine, and began practice in Wallingford, Conn., but finally settled near Sunbury, Ga., where he became a leading physician. The settlers in this locality were from New England, and on the outbreak of trouble with England, they with Hall as leader took active part in the rebellion, though Georgia was slow in joining the patriot cause. Hall was sent by them as a representative to the Continental Congress, where he was admitted by a unanimous vote, and took part in all debates, but did not vote when the vote was taken by colonies, until Georgia was represented as a colony. In 1776 it was so represented, and Hall continued a member of the Congress till 1780, being one of those who signed the Declaration of Independence. He was elected governor of Georgia in 1783, and in an energetic administration of one year, he did much to repair the damage done by the war, established land offices and schools, and then retired from public life. Consult: Dwight, 'Signers of the Declaration' and an article, 'Lyman Hall' in the 'Magazine of American History,' XXV. 35.

Hall, Marshall, English physician and physiologist: b. Basford, near Nottingham, 18 Feb. 1790; d. Brighton, England, 11 Aug. 1857. In 1809 he commenced the study of medicine at the University of Edinburgh, and took his degree in 1812. In 1817 he commenced practice at Nottingham, and soon rose to eminence. In 1826 he settled in London, where he carried on a most successful practice. He paid especial attention to the symptoms of illness and in 1817 published 'Diagnoses of Diseases,' and in 1824 his 'Medical Essays' appeared. His 'Essay on the Circulation of the Blood' (1831) contained an account of his discovery of the so-called "caudal heart" in the tail of the eel. The more important of his other writings are: 'Lectures on the Nervous System and its Diseases' (1836), 'Theory and Practice of Medicine' (1837); 'Theory of Convulsive Diseases' (1848). His services to the cause of humanity were numerous and valuable, and among these one of the most widely known is the method which he invented of restoring suspended respiration, now generally adopted in the case of persons partially drowned. It is known as the "Marshall Hall Method." See DROWNING.

Hall, Robert, English Baptist clergyman: b. Arnsby, Leicestershire, England, 2 May 1764; d. Bristol, England, 21 Feb. 1831. He studied at the Baptist College at Bristol and King's College, Aberdeen, and entered the Baptist ministry, becoming in a few years not only the most prominent minister in his denomination but one of the very foremost of English orators. He was also widely known as a master of prose style, his most noted writings being 'Apology for the Freedom of the Press' (1793); 'Modern Infidelity' (1800); 'Reflections on War' (1802). He was subject to attacks of insanity but in spite of this misfortune accomplished a vast amount of intellectual work and was a tireless student. His complete works in six volumes reached an 11th edition in 1853.

Hall, Robert Henry, American soldier: b. Detroit, Mich., 15 Nov. 1837. He was educated at West Point and served in the Federal army during the Civil War, and was in command of a brigade during the war in the Philippines. He became a brigadier-general in the United States army in 1901. He has published 'Register of the United States Army 1789–98'; 'History of the Flag of the United States'; 'History of United States Infantry Tactics.'

Hall, Ruth, American novelist: b. Schoharie, N. Y., 10 April 1858. Besides more or less journalistic work she has written: 'In the Brave Days of Old' (1898); 'The Boys of Scrooby' (1899); 'The Black Gown,' a novel of colonial Albany (1900); 'The Downrenter's Son,' a novel of the anti-rent troubles in New York State (1902); 'The Golden Arrow' (1903).

Hall, Samuel Carter, English miscellaneous writer: b. Topsham, Devonshire, England, 1801; d. 16 March 1889. For over 40 years he was the editor of the 'Art Journal,' which he founded in 1839. With his wife (Anna Maria) (q.v.) he published: 'Ireland, its Scenery and Character' (1841–3); 'Book of Royalty' (1838); 'A Woman's Story' (1857); 'The Book of the Thames' (1859); 'A Companion to Killarney' (1878); and others. His separate works were: 'A Book of Memories'; 'Book of British Ballads'; 'Baronial Halls'; 'Retrospect of a Long Life' (1883).

Hall, Thomas, American inventor: b. Philadelphia 4 Feb. 1834. He was educated at the University of Pennsylvania, and subsequently studied mechanics in Europe, and at the Paris exposition in 1867 placed a keyed typewriter on exhibition. His numerous inventions include a mechanism for printing by touching keys; a keyed typewriter, the Hall typewriter, first offered for sale in 1881; several sewing-machines, as well as drill-grinding and other machinist tools, etc.

Hall, Thomas Cuming, American theologian: b. Armagh, Ireland, 25 Sept. 1858. He was graduated from Princeton in 1879, from the Union Theological Seminary in 1882, studied also in Berlin and Göttingen, and was a pastor in

Omaha and Chicago. In 1898 he became professor of theology in the Union Seminary. Among his works are: 'The Power of an Endless Life' (1893); 'The Social Significance of the Evangelical Revival in England' (1899); and 'The Synoptic Gospels' (1900).

Hall, a large room or apartment, the term having its origin in the castles and mansions of the Middle Ages. Here the king or the lord of the manor gave audience, administered justice, and received and entertained his retainers and guests. At one end of the hall was a raised platform or dais, on which the table of the lord of the manor and his honored guests was placed. This end of the hall was usually lighted with large oriel windows, and communicated with a building which contained the lords' solar, or bedroom and parlor, on the upper floor, and the wine cellar below. The retainers sat at a table which ran along the lower part of the hall. The entrance was at the lower end of the hall, where a passage gave access to the kitchen, pantry, and buttery. Above the passage a gallery for musicians was frequently constructed. Survivals of such mediæval dining halls may be found in the Oxford and Cambridge colleges; also in the halls of the Inns of Court and of some of the London guilds. The hall partook of the style of architecture prevailing at the time when it was built, and being a large and important apartment was generally ornamental in its character. The hall of the king's palace, now known as Westminster Hall, built by William Rufus and restored by Richard II., is the finest example in England, being 300 feet long and 100 feet broad. In the United States Nassau Hall, Princeton; Carnegie Hall, New York; Faneuil Hall, Boston; Independence Hall, Philadelphia, are examples of the modern hall.

Hall-marks. See PLATE-MARKS.

Hall of Fame, a memorial to famous Americans, at the New York University. The institution received a gift of $100,000 with which it built a colonnade 500 feet long on University Heights, a beautiful site in upper New York, overlooking the valleys of the Harlem and the Hudson. Large panels to the number of 150, two feet by eight, will bear simple inscriptions of the names and dates of birth and death of the famous native Americans who are chosen as the 150 greatest men. Of these, 50 were chosen in 1903, and five every five years thereafter till the year 2000. The public was invited to make nominations; and such nominations as were seconded by the Senate of the University were submitted to 100 judges, representing every State in the Union. These judges were university and college presidents, professors of history, scientists, publicists, editors, authors, and judges of the supreme court, national and state. Ninety-seven of these sent in their votes, and 29 great men, native and 10 years dead, chosen by this vote, and thereafter ratified by the Senate of the University, are the first of these immortals.

Naturally George Washington headed the list, with Abraham Lincoln second, and Daniel Webster came third. The names of Bryant, Poe, and Cooper are likely to be added hereafter. Lowell was not dead 10 years and was not yet eligible. Bryant failed by three votes, Greeley by five, Motley by nine. The most animated discussion was provoked by the selection of General Robert E. Lee. But since only a minority of the judges were Southern men, the vote for him was at least not sectional. The names of 21 other great men will be added to the list. The following shows the roll of names chosen for the Hall of Fame, and the number of votes that each received:

George Washington	97
Abraham Lincoln	96
Daniel Webster	96
Benjamin Franklin	94
Ulysses S. Grant	92
John Marshall	91
Thomas Jefferson	90
Ralph Waldo Emerson	87
Henry Wadsworth Longfellow	85
Robert Fulton	85
Washington Irving	83
Jonathan Edwards	81
Samuel F. B. Morse	80

Hall of Odin, a tradition among the Scandinavian peoples, which tells of the rocks from which the Berserkers, when tired of life, flung themselves into the sea; so named because they were regarded as the portals of the Scandinavian Valhalla.

Hallam, hăl'am, **Arthur Henry,** English essayist: b. London 1 Feb. 1811; d. Vienna 15 Sept. 1833. He was a son of Henry Hallam (q.v.), and was graduated in 1832 from Trinity College, Cambridge, entered the Inner Temple and later the office of a conveyancer of Lincoln's Inn; and died during a visit to the Continent. At Cambridge he met Alfred Tennyson, whose 'In Memoriam,' through which he is best known, employs his sudden and untimely death as a basis for the exposition of a poet's philosophy. His 'Remains in Prose and Verse' (1834), largely justify the high hopes entertained for him, especially in the critique of Rossetti's 'Disquisizione sullo spirito antipapale,' and the essay on Cicero.

Hallam, Henry, English historian: b. Windsor 9 July 1777; d. Penshurst, Kent, 21 Jan. 1859. He was educated at Oxford, and in 1818 made his appearance as an author by his 'View of the State of Europe during the Middle Ages,' which at once established his reputation, and is acknowledged as a standard work. His next work, the 'Constitutional History of England' (1827), is justly regarded as a model at once of laborious research and scrupulous impartiality — an impartiality so scrupulous, that his readers are sometimes perplexed to discover to which side his judgment inclines. His 'Introduction to the Literature of Europe' (1837–9), if it could not add to his reputation, certainly did not detract from it. His eldest son, Arthur Henry (q.v.), died in early manhood; the great hopes buried with him may be gathered from a most affecting 'Memoir' printed by his father for private circulation, while Tennyson's

‹In Memoriam,› of which Arthur Hallam is the subject, has raised to him a durable monument.

Hallé, häl-lā, Sir **Charles**, Anglo-German pianist: b. Hagen, Westphalia, 11 April 1819; d. Manchester, England, 25 Oct. 1895. He studied first at Darmstadt, and afterward at Paris, where his reputation was established by his concerts of classical music. But the revolution of 1848 sent him to England, and he made his home in Manchester. There he established in 1857 a series of subscription orchestral concerts which did much to raise the popular standard of musical taste by familiarizing the British public with the great masters of classical music. The orchestra which he conducted some forty years was the most finely trained body of musicians in the United Kingdom. He was knighted in 1888, and married the same year the famous violinist, Madame Norman-Neruda.

Hallé, Wilma Maria Francesca Neruda, Lady, Austrian violinist: b. Brunn, Moravia, 1840. She made her debut at Vienna in 1846, exciting the greatest enthusiasm by her wonderful execution. Her first husband was a Swedish musician, Ludwig Norman, and as Madame Norman-Neruda she was famous in England and America long before her marriage to Sir Charles Hallé (q.v.) in 1888. After the death of the latter she visited the United States on a concert tour.

Halle, häl'lė, or **Halle an der Saale,** än-dĕr-zä'lė, Germany, a town and important railway junction of six lines, in Prussian Saxony, about 20 miles northwest of Leipsic, on the river Saale. It consists of the mediæval town with narrow, crooked streets and ancient dwellings, separated by boulevards on the site of the old ramparts, from extensive and handsome suburbs. Among notable public buildings are the restored mediæval Rathaus; the «Red Tower» in the market place, a 15th century clock-tower; the decaying Moritzburg, formerly a citadel and archiepiscopal residence; the modern Gothic Ratskeller; the extensive buildings of the University (q.v.); a deaf and dumb asylum; a lunatic asylum; the 12th century Moritzkirche with fine wood carvings; the 16th century Protestant cathedral; and the 16th century Gothic church of the Virgin, with four towers and noted for its handsome interior. In the suburb of Glaucha the Waisenhaus, «orphan house,» or institution founded by the Rev. Francke about 1693 forms a small town in itself. Besides the orphan asylum it includes different grade schools, attended by between 3,000 and 4,000 pupils; a printing and publishing establishment; and a laboratory where medicines are prepared and sold. The trade and manufactures of Halle are extensive. The latter include starch, beet-root sugar, chemicals, oil, machinery, etc., besides the celebrated ancient salt works.. The salt workers form a distinctive colony with special exemptions and privileges and are known as «Halloren.» Halle is mentioned as Halla as early as 806; in the 12th century it had developed considerable trade, and in the next two centuries was an important member of the Hanseatic League. In 1806 it was taken by the French; in 1813 it was annexed to Prussia. Pop. (1900) 156,661.

Halle, University of, Germany, a celebrated institution founded in 1694 by King Frederick I. in the interests of the jurist Thomasius, when he was followed to Halle by several students after his retirement from Leipsic owing to the envy of his fellow professors. It attained a high degree of prosperity, but owing to its strong Prussian proclivities was suppressed by Napoleon in 1806 and in 1813. It was re-established in 1815 and in 1817 was united with the University of Wittenberg. Its buildings which are very extensive, especially those accommodating the medical faculty, date from 1832. There are faculties of theology, law, medicine, and philosophy. From its foundation Halle was recognized as one of the principal schools of Protestant theology, and has numbered among its professors some of the most eminent names of Germany. Connected with the university is an ever-increasing library of over 220,000 volumes and MSS., a medical and surgical clinical institute; a maternity hospital; an observatory; a theological and normal seminary; and a botanical garden; especial attention is devoted to agriculture. In 1903 the university had nearly 2,000 students.

Halleck, hăl'ĕk, **Fitz-Greene,** American poet: b. Guilford, Conn., 8 July 1790; d. there 19 Nov. 1867. At 18 he became a clerk in a New York bank, in which employment he remained for 20 years. For a long period after this he was the confidential agent of John Jacob Astor, and was named by him one of the original trustees of the Astor Library. In 1849 he retired to his native town. He wrote verses in his boyhood, but these early effusions were excluded from the collected editions of his poems. In 1819 he assisted Joseph Rodman Drake (q.v.) in the humorous series of ‹Croaker› papers, contributed to the New York *Evening Post.* Drake's death in the succeeding year was commemorated by Halleck in a most touching poem. In 1819 was published Halleck's longest poem, ‹Fanny,› a satire, in the measure of Byron's ‹Don Juan,› on the fashions, follies, and public characters of the day. From the variety and pungency of the local and personal allusions it enjoyed a great but fleeting popularity. In 1827 he published an edition of his poems in one volume, two of the best in the collection, ‹Alnwick Castle› and ‹Burns,› having been suggested by scenes and incidents of foreign travel. This edition also included the spirited lyric, ‹Marco Bozzaris,› by which he will probably be longest kept in mind. Consult Wilson, ‹Life and Letters of Fitz-Greene Halleck› (1869).

Halleck, Henry Wager, American soldier: b. Westernville, N. Y., 16 Jan. 1815; d. Louisville, Ky., 9 Jan. 1872. He was graduated at the United States Military Academy in 1839, was assistant to the Board of Engineers at Washington 1840–1, and in 1841–6 assistant engineer in the repair of the New York harbor fortifications. In the Mexican War he was on the Pacific coast, and in 1847–9 was secretary of State for California under the military government. After service as inspector and engineer of lighthouses (1852–4) and as engineer of the board for fortifications on the Pacific coast (1853–4), he resigned from the service in 1854, and practised law in San Francisco. On the outbreak of the Civil War he re-entered the army, and in November 1861, was appointed commander of the department of the Missouri,

then in a state of thorough disorganization. He quickly reduced the department to order, outlined the western campaign of 1862, directed this campaign in person from 11 April, and took Corinth, with its 15 miles of entrenchments, on 30 May. In July he became general-in-chief of the armies of the United States; and henceforth directed from Washington the movements of the generals in the field, till, in March 1864, he was superseded by Gen. Grant. Halleck was chief of staff till 1865, commanded the military division of the James in 1865, that of the Pacific, 1865–9, and that of the South from 1869 until his death. He wrote a work on 'The Elements of Military Art and Science' (1846), largely used as a manual in the Civil War; 'Bitumen' (1841); 'A Collection of Mining Laws of Spain and Mexico' (1859), and other volumes.

Halleck, Reuben Post, American educator: b. Rocky Point, L. I., 8 Feb. 1859. He was graduated from Yale in 1881, was instructor in the Male High School, Louisville, Ky., 1883–96, and principal from the latter date. He has published: 'Psychology and Psychic Culture' (1895); 'The Education of the Central Nervous System' (1890); 'History of English Literature' (1900).

Hallelujah, hăl-e-loo'ya, **Halleluia,** or **Alleluia** (Hebrew), «Praise ye the Lord»; an expression which occurs often in the Psalms, and which was retained when the Bible was translated into the various languages, probably on account of its full and fine sound, which, together with its simple and solemn meaning, so proper for public religious services, has rendered it a favorite of musical composers. The Roman Catholic Church does not allow it to be sung on the Sundays during Lent, on account of the mournful solemnity of the season; and in that church it is not sung again before Easter. It is no longer sung in masses for the dead as formerly. In the time of Augustine the African Church used this doxology only from Easter to the feast of Pentecost. The Greeks made an earlier or more common use of the Hallelujah than the Latin Church. The Jews call the Psalms cxiii.-cxvii. the Great Hallelujah, because they celebrate the particular mercies of God toward the Jews, and they are sung on the feast of the Passover, and on the feast of Tabernacles.

Haller, Albrecht von, ăl'brĕHt fōn häl'lĕr, Swiss anatomist, botanist and poet: b. Bern 16 Oct. 1708; d. there 12 Dec. 1777. Having chosen the medical profession, he went to the University of Tübingen, where he studied comparative anatomy under Duvernoy; and in 1725 removed to Leyden, then the first medical school in Europe. After extensive travels in England and France he went to Basel in 1828 to study mathematics under Bernoulli. Here he first imbibed a taste for botany, and composed his poem 'Die Alpen', followed by various ethical epistles and other pieces, which gave him a reputation in Germany. In 1729 he returned to his native city, and entered on his professional career as a public lecturer on anatomy. In 1736 he became professor of anatomy, surgery, and botany, in the newly founded University of Göttingen, and through his influence the university was enriched with a botanical garden, an anatomical theatre, a school for midwifery, and a college of surgery. In 1747 appeared the first edition of his 'Primæ Lineæ Physiologiæ,' which, long after the death of the author, was used as a text-book in schools of medicine. In 1752 he first advanced his opinions on the properties of sensibility and irritability as existing in the nervous and muscular fibres of animal bodies; doctrines which attracted much attention, and excited great controversies in the medical world. Disagreements with his colleagues induced him to return, in 1753, to Bern, where his countrymen received him with the respect due to his fame and talents. Having been elected a member of the sovereign council of the state, he soon obtained by lot one of its magistracies, and entered with zeal on the duties of a citizen, though he did not neglect his scientific pursuits. He was elected in 1754 one of the foreign associates of the Paris Academy of Sciences. In 1758 he became director of the public salt-works at Bex and Aigle, and in the course of his superintendence introduced many improvements in the manufacture of salt. His later published works include: 'Elementa Physiologiæ Corporis Humani' (1757–66); 'Bibliotheca Botanica' (1771); 'Bibliotheca Anatomica' (1774); 'Bibliotheca Chirurgica' (1774); 'Bibliotheca Medicinæ Practicæ' (1776–88).

Haller is considered one of the greatest German poets of the 18th century. His philosophical and descriptive poems display depth of thought and richness of imagination. His 'Elegiac Poems' (Die elegischen Gedichte) are still frequently republished in Germany. He wrote in prose three philosophico-political romances — 'Usong,' 'Alfred the Great,' and 'Fabius and Cato' — designed to exhibit the respective advantages of different forms of government, and corresponded in German, Latin, Italian, English, and French with all parts of Europe.

Hal'lett, Benjamin Franklin, American statesman: b. Barnstable, Mass., 2 Dec. 1797; d. Boston 30 Sept. 1862. Graduated from Brown University in 1816, he studied law, was admitted to the bar, and was connected with the Providence (R. I.) press, but later went to Boston, and there became editor of the Boston *Advocate*, the official mouthpiece of the Anti-Masonic party. From 1827 to 1831 he edited the Boston *Daily Advertiser*, which he made extremely unpopular through his vigorous enunciation of his views on masonry, temperance, and emancipation. He afterward became a Democrat and an influential factor in his party. For years he was chairman of its national committee, and it was he who drafted the Cincinnati platform of 1856. President Pierce, whose nomination he had helped to secure, appointed him United States district attorney in 1853.

Hal'lettsville, Texas, city, county-seat of Lavaca County; on the San Antonio & A. P. railroad; about 100 miles southwest of Houston. It is in an agricultural and stock-raising region, and special attention is given to cotton and cattle. It has a cotton-seed oil mill and a number of cotton-gins. Large shipments are made each year of live-stock, cotton, and cotton-seed oil. Pop. (1900) 1,457.

Halley, hăl'ĭ, **Edmund,** English mathematician and astronomer: b. Haggerston, near London, 29 Oct. 1656; d. Greenwich, Kent, 1742. Before he was 19 he published 'A Direct and Geometrical Method of Finding the Aphelia and

Eccentricity of Planets,' which supplied a defect in the Keplerian theory of planetary motion. By some observations on a spot which appeared on the sun's disk in July and August 1676, he established the certainty of the motion of the sun round its own axis. August 21, the same year, he fixed the longitude of the Cape of Good Hope by his observation of the occultation of Mars by the moon. In 1679 he published 'Catalogus Stellarum Australium, sive Supplementum Catalogi Tychonici,' etc., and in 1683 his 'Theory of the Variation of the Magnetical Compass,' in which he endeavors to account for that phenomenon by the supposition of the whole globe of the earth being one great magnet, having four circulating magnetical poles or points of attraction. For the purpose of making further observations relative to the variation of the compass he set sail on a voyage in 1699, and having traversed both hemispheres arrived in England in September 1700. The spot at St. Helena where he erected a tent for making astronomical observations is still called Halley's Mount. As the result of his researches he published a general chart, showing at one view the variation of the compass in all those seas with which English navigators were acquainted. He was next employed to observe the course of the tides in the English Channel, with the longitudes and latitudes of the principal headlands, in consequence of which he published a large map of the channel. In 1703 he was elected Savilian professor of geometry at Oxford, and in 1720 he received the appointment of astronomer-royal at Greenwich, where he afterward resided, devoting his time to completing the theory of the motion of the moon. In 1721 he began his observations, and for the space of 18 years scarcely ever missed taking a meridian view of the moon, when the weather was not unfavorable. In 1752 appeared his 'Astronomical Tables,' and he was the author of a great number of papers in the 'Philosophical Transactions.' For the comet called by his name, see COMET.

Halliwell-Phillipps, hăl'ĭ-wĕl-fĭl'ĭps, **James Orchard,** English antiquary and Shakespearian scholar: b. Chelsea, London, 21 June 1820; d. Hollingsbury Copse, near Brighton, 3 Jan. 1889. He was educated at Cambridge. In 1839 he was elected Fellow of the Royal and Antiquarian Societies. Gradually he came to concentrate his studies on Shakespeare alone, and more particularly on the facts of the poet's life, discrediting the internal evidence of the plays and sonnets, and devoting his attention to a minute and patient study of local tradition and the records of 32 towns besides Stratford. The successive editions of his 'Outlines of the Life of Shakespeare' (1848; 8th ed. 1889) recorded the growing results of his discoveries. Apart from Shakespeare, his 'Nursery Rhymes and Nursery Tales of England' (1845), and 'Dictionary of Archaic and Provincial Words' (1847; 6th ed. 1868) will keep his name from being forgotten. His magnificent folio edition of the 'Works of Shakespeare,' probably the richest storehouse extant of Shakespearian criticism (1853–65), was published at a price prohibitive to most students. To the Smithsonian Institute he gave (1852) a collection of accounts, inventories, and bills illustrative of the history of prices current in the years 1650–1750.

Hal'lock, Charles, American journalist and author: b. New York 13 March 1834. He was graduated from Amherst in 1854, was editor of the New Haven *Register* in 1855–6, of the New York *Journal of Commerce* in 1856–61, of the St. John (N. B.) *Telegraph and Courier* in 1863–5. In 1873 he founded 'Forest and Stream,' and in 1896–7 was editor of the 'Northwestern Field and Stream.' In 1874 he founded the International Society for the Protection of Game. He did field-work and collecting for the Smithsonian Institution, and published numerous works, such as: 'The Fishing Tourist' (1873); 'Camp Life in Florida' (1876); 'Vacation Rambles in Michigan' (1877); 'Dog Fanciers' Directory' (1886); 'The Salmon Fisher' (1890). He was a son of Gerard Hallock (q.v.).

Hallock, Gerard, American journalist: b. Pittsfield, Mass., 18 March 1800; d. New Haven, Conn., 4 Jan. 1866. He was graduated from Williams College in 1819, in 1824 founded the Boston *Telegraph* (united with the *Recorder* in 1825), in 1827 purchased a part interest in the New York 'Observer,' and in 1828 became associated with David Hale on the *Journal of Commerce.* A leader in journalistic enterprise, he started (1833) a pony-express between Philadelphia and New York, and operated the Evening Edition, a schooner which met incoming ships at Sandy Hook, and brought foreign news. A pro-slavery man, he was a founder of the Southern Aid Society (1854), intended to succeed the American Home Missionary Society when the latter refused support to slave-holding congregations. In 1861 the *Journal of Commerce* was forbidden the use of the United States mails, and Hallock thereupon sold his interest, and never afterward wrote for the press. He was a founder of the Associated Press.

Hallock, Joseph Newton, American Presbyterian clergyman and religious journalist: b. Franklinville, N. Y., 1834. He was graduated from Yale in 1857 and from the Yale Theological Seminary in 1860, and after holding pastorates of several Presbyterian churches became editor and proprietor of 'The Christian at Work.' Among other works he has published 'The Christian Life' (1890); 'Family Worship' (1892); 'What is Heresy?' (1894); 'Mormonism' (1896); 'Life of D. L. Moody' (q.v.) (1900).

Hallowe'en, hăl-ō-ēn', or **Hallow-Even,** the evening of 31 October, so called as being the eve or vigil of All Hallows, or festival of All Saints, which falls on 1 November. It is associated in the popular imagination with the prevalence of supernatural influences, and is clearly a relic of pagan times. In the north of England, hallowe'en is known as Nutcrack Night. In Scotland the ceremonies of the eve were formerly regarded in a highly superstitious light, and Burns' 'Hallowe'en' gives a humorous and richly imaginative presentment of the usual ceremonies as practised in Scottish rural districts in his day. The principal object of curiosity in consulting the future was to discover who should be the partner in life. Popular belief ascribed to children born on hallowe'en the faculty of perceiving and holding converse with supernatural beings.

Hal'lowell, Richard Price, American author and wool merchant: b. Philadelphia 16 Dec. 1835; d. Medford, Mass., 5 Jan. 1904. He was prominent in the abolition movement, was appointed by Gov. Andrew of Massachusetts special agent to recruit negro regiments, and subsequently was vice-president of the New England Woman Suffrage Association. He published 'The Quaker Invasion of Massachusetts' (1883), etc.

Hallowell, Me., city in Kennebec County, on the Kennebec River, and on the Maine Central railroad; two miles south of Augusta and four miles north of Gardiner. The first permanent settlement was made in 1754. It was incorporated as a township in 1771, and chartered as a city 29 Aug. 1850. At the time of its becoming a chartered city it included within its limits Chelsea, Manchester, and Farmingdale. The city is governed by a mayor and a council of seven members elected annually. It has two banks with a combined capital of $150,000. The industries of the city include granite works, shoe manufactories, glue works, cotton goods, machinery, etc. The Hubbard Free Library and the Maine Industrial School are public institutions. Pop. (1904) 3,000.

Hall'statt Epoch, a name taken from the necropolis of Hallstatt, Upper Austria, not far from Salzburg, and applied to that culture in Europe — parts of Germany, France, Italy, and in Switzerland, Bohemia, etc. — distinguished as the last bronze and first iron stage, dating back at least as far as 1000 B.C. According to some ethnologists in the eastern highlands of the Alps this culture was of a higher evolution than that of a partially Oriental cast in the west during the Neolithic epoch.

Hällström, Ivar, ē'vär hĕl'strėm, Swedish composer: b. Stockholm 5 June 1826; d. there 11 April 1901. He studied law at Upsala, then turned his attention to music, in 1861–72 was director of the institute founded by Lindblad, and from 1881 instructor to the Royal Opera. His works include the operas 'Den Bergagna' ("The Mountain King" 1874); and 'Neaga' (libretto by Carmen Sylva, 1885); cantatas, numerous songs, and an 'Idyle' for orchestra, chorus, and solo voices, for which he received (1860) a prize from the Stockholm Musical Union.

Hallucina'tions, are morbid conditions of mind in which the patient is conscious of a perception without any impression having been made on the external organs of sense. Hallucinations are to be distinguished from delusions, for in these there are real sensations, though they are erroneously interpreted. All the senses are not equally subject to hallucinations; the most frequent are those of hearing; next, according to many, come those of sight, smell, touch, and taste; and hallucinations of several senses may exist simultaneously in the same individual. They may also be complicated with certain delusions. Often even the hallucination of one sense is confirmed by the delusion of another, so that it is neither possible nor necessary always to distinguish hallucinations from delusions. The simplest form of hallucinations of hearing is the tingling of the ears; but the striking of clocks, the sounds of musical instruments and of the human voice are often heard, and in these instances, as in those of the perturbations of the other senses, there must be a diseased sensorium, though there should be no structural derangement of the nerves. Hallucinations are not confined to those whose mental faculties have been alienated, but occasionally assail and torment even the sane. The second Earl Grey was haunted by a gory head, but he could dismiss it at will. Swedenborg had a similar faculty; and Bernadotte, king of Sweden, was besieged in his rides by a woman in a red cloak, being perfectly conscious of the hallucination under which he labored. Lord Brougham proposed that the existence of hallucinations should be established as an authoritative test for the existence of insanity; but, as will have been seen, this would be no test at all. The proportion of the hallucinations of the various senses has been by some tabulated thus: — hearing, 49; vision, 48; taste, 8; touch, 3; smell, 1. All are more frequent in mania than in monomania, and in mania errors of vision are more numerous than those of hearing. See APPARITIONS; DREAMS; GHOSTS; INSANITY.

Hallux Valgus, a deformity of the great toe consisting of a turning of the toe toward its neighbor, with a marked enlargement of the head of the bone. The synovial sac on the inner side of the toe is often chronically inflamed from constant pressure, forming a bunion. Advanced cases may require the excision of the bony outgrowths, but early cases may be relieved by a properly adjusted shoe.

Halmahera, häl-mä-hā'rä. See GILOLO.

Halo, the name given to colored circles sometimes seen around the sun or moon, and to other connected luminous appearances. Sometimes as many as three circles are seen round the sun. A white band across the sun, parallel to the horizon, is also sometimes seen; and sometimes a second white band, perpendicular to the first. These bands form a cross, and stretch out so as to cut the circles of the halo. It is on these bands that parhelia or mock suns are formed. The explanation of halos is complex and difficult. Marriotte attributed the colored rings to refraction of light through small crystals of ice in the air, and calculation appears to confirm his hypothesis. The third circle is probably due to refraction of light that has undergone internal reflection in the crystals in a way similar to that which occurs in the formation of the rainbow. On the other hand, the white bands crossing the sun must be due to reflection of light from the surfaces of the crystals. See LIGHT; PARHELION; SUN.

Halogen, hăl'ō-jĕn, in chemistry, an element, or inorganic radical, which unites directly with a metal to produce a saline substance, such as common salt. The term is usually confined to the elements fluorin, chlorin, bromin, and iodin, and the compound known as cyanogen.

Halophytes, hăl'ō-fīts, a group of plants considered with reference to their habitat, and including those which inhabit salt marshes, and by combustion yield barilla, as *Salsola, Salicornia*, and *Chenopodium*. For further examples see BEACH-PLANTS and DESERT PLANTS.

Hal'pine, or **Halpin, Charles Graham,** American soldier and author: b. Oldcastle, County Meath, Ireland, 20 Nov. 1829; d. New York

3 Aug. 1868. After study at Trinity College, Dublin, he came to Boston, Mass., in 1851, was there assistant editor of the *Post*, and with B. P. Shillaber began the 'Carpet Bag,' an unsuccessful humorous periodical. Later Washington correspondent of the New York *Times*, he then went to New York, where he was connected with the *Herald*, and wrote much ephemeral matter for magazines. Upon the outbreak of the Civil War he enlisted in the 69th New York volunteer infantry, and was afterward on the staff of Hunter as assistant adjutant-general, of Gen. Halleck with the rank of colonel. In 1864 he resigned from the service and was brevetted brigadier-general of volunteers. He was best known for his burlesque verses, written in the character of an Irish private, "MILES O'REILLY," over which pseudonym they appeared. 'Life and Adventures, Songs, Services, and Speeches' was published in 1864, and his complete 'Poetical Works' in 1869.

Hals, häls, **Frans**, Dutch painter: b. Anwerp about 1584; d. Haarlem 7 Sept. 1666. When young he went to Haarlem, where he studied painting under Karel van Mander, and he was one of the civic guard, director of an art school, and chief of the painters' guild. His first dated work is a portrait belonging to the year 1613, his next, the 'Banquet of the Officers of the Haarlem Corps of Arquebusiers of St. George' (1616), one of the earliest pictures belonging to the Dutch school of genre painting, of which Hals is sometimes regarded as the founder. He executed 'The Jolly Trio,' 'Herring Vender,' and 'Fool Playing a Lute,' and seems to have found in genre painting a scope and a possibility of humor much to his taste. He executed also many single-figure pieces, as 'Hille Bobbe' (National Gallery, Berlin; replica in the Metropolitan Museum), and numerous portraits, all of high value artistically. Hals is ranked among the foremost of portrait artists, being notably successful in illuminating the character of the face. Adrian van Ostade, Wouwerman, and Adrian Brouwer were among his pupils. He is said to have been improvident in his habits, and latterly received a pension from the municipality of Haarlem. His brother DIRK, d. Haarlem May 1656, and his son, FRANS HALS, THE YOUNGER, b. about 1620; d. about 1669, were also excellent painters.

Hal'sey, Francis Whiting, American journalist: b. Unadilla, N. Y., 15 Oct. 1851. He was a member of the editorial staff of the New York *Tribune* 1875–80, and was attached to that of the New York *Times* 1880–1902, editing the *Times* 'Saturday Review' from 1896. He has published 'Two Months Abroad' (1878); 'The Old New York Frontier' (1901); 'American Authors and their Homes'; 'Essays'; 'Our Literary Deluge' (1902).

Hal'stead, Murat, American journalist: b. Ross, Butler County, Ohio, 2 Sept. 1829. At 18 he began writing for newspapers, studied at Farmers' College, near Cincinnati, and did local newspaper reporting on several Cincinnati papers. In 1853 he became manager of a department on the Cincinnati *Commercial*. The following year he acquired a pecuniary interest in the paper, which began rapidly to increase in circulation and influence, so that in a few years it was considered one of the most influential newspapers in the West. The *Commercial* combining with the *Gazette*, its rival, the Cincinnati *Commercial-Gazette*, became the recognized organ of the Ohio Republicans. In 1890 he removed to Brooklyn, N. Y., where he edited the *Standard Union*. Later he was a contributor to magazines and special correspondent, and in the latter capacity went to the Philippines during the Spanish-American War. He wrote: 'The Story of Cuba'; 'Life of William McKinley'; 'The Story of the Philippines'; 'History of American Expansion'; 'Life of Admiral Dewey'; 'The Boer and British War.'

Halsted, George Bruce, American mathematician: b. Newark, N. J., 25 Nov. 1853. He was graduated from Princeton in 1875 and since 1884 has been professor of mathematics in the University of Texas. He has published 'Mensuration' (1881); 'Elements of Geometry' (1885); 'Elementary Synthetic Geometry' (1892); 'Pure Projective Geometry' (1895).

Ham, one of the three sons of Noah, from whom the earth after the Deluge was peopled. He is first mentioned between the other two — Shem, Ham, and Japheth; but afterward is expressly designated the younger son of Noah, that is, relatively to the other two. He had four sons — Cush, Mizraim, Phut, and Canaan. The three first traveled southward, and from them chiefly sprang the tribes that peopled the African continent, as Canaan became the father of the tribes that principally occupied the territory of Phœnicia and Palestine. Ham is also used as a designation of Egypt, probably on account of its population having sprung from a son of Ham, and the name Ammon, by which the chief god of the northern Africans was often called and worshipped, may very likely derive its origin from the same source.

Ham, the joint which unites the thigh and the leg of an animal, but more generally understood to mean the cured thigh of the hog. Ham-curing is now an important branch of business, especially in Great Britain and America, and the details of the process are generally the same everywhere. The meat is first well rubbed with salt, and a few days after it is rubbed again with a mixture of salt, saltpetre, and sugar, though sometimes the saltpetre is omitted. After lying in the tub for eight or ten days it is ready for drying. Wet-salting requires three weeks, and dry-salting four. The smoking of hams is carried on in smoke-houses, the meat being hung as high as possible, and subjected to the smoke of a fire kindled on the ground-flat, and which ascends through holes in the flooring. The process of smoking is for the most part carried on in winter, the fire being kept in a smouldering state for five or six weeks. Wood is used in preference to coal in the process of smoking. See PORK.

Ham-beetle, or **Paper-worm**, a small clerid beetle (*Necrobia rufipes*), sometimes a pest of considerable importance because of the occurrence of its larvæ or "worms," the paper-like cocoons and beetles on hams in such numbers as to render them unmerchantable. Its injuries are generally confined to the exterior and are due to carelessness in packing and to the cracking of the ham coverings. This is one of three cosmopolitan species of the same genus, all of which are carnivorous scavengers.

Ham-fly, a name of the cheese-fly (q.v.), due to the occasional appearance of its maggots or «skippers» in the fatty exterior portions of preserved hams.

Hama, hä'mä, or **Hamah,** Syria, the Biblical HAMATH, a very ancient city, on the El-Asi (Orontes), 110 miles northeast of Damascus. It is surrounded by gardens, and has narrow, crooked streets, with houses built of timber, and sun-dried bricks. There are manufactures of yarn and coarse woolens, and a general domestic and caravan trade. Hamath is frequently mentioned in Old Testament history as in conflict with the Assyrians; first as early as 854 B.C. After the Græco-Macedonian conquest it became known as Epiphania. In 639 it was captured by the Moslems. Abulfeda, the Arabian geographer, was prince of Hama from 1310–31. In 1812 Burckhardt here discovered the four Hittite stones, the inscriptions of which are still undeciphered. Pop. (est.) 45,000.

Hamadryad, hăm'a-drī-ăd. (1) A baboon (q.v.). (2) The king-cobra (*Naja bungarus*), one of the Oriental cobras, found from Southern India to China and the Philippines, and closely allied in structure, markings, and habits to the cobra di capello, but much larger, reaching the length sometimes of 13 feet, making it the longest of venomous serpents. It is also the most fierce in disposition, but fortunately is nowhere common, and feeds wholly on other snakes. Consult Fayrer, 'Thanatophidia of India' (1874).

Hamadryads, in Greek mythology, the eight daughters of Hamadryas. They received their names from trees, and are the same as the Dryads (q.v.). They were conceived to inhabit each a particular tree, with which they were born, and with which they perished.

Hamame'lis. See WITCH HAZEL.

Haman, hā'man, a minister of the Persian king Ahasuerus. Because Mordecai the Jew refused to pay him homage, he resolved on the destruction of all the Jews in the Persian monarchy. By falsehood and intrigue he succeeded in obtaining a decree for this purpose; but Esther, the Jewish consort of Ahasuerus, interposed for their deliverance, and Haman was hanged on the very gibbet he had caused to be prepared for Mordecai. His history is contained in the book of Esther.

Hamath, hā'măth. See HAMA.

Hăm'blin, Joseph Eldridge, American soldier: b. Yarmouth, Mass., 1828; d. New York 3 July 1870. Not long after the commencement of the Civil War, he became adjutant of the 5th New York, later was transferred to the 65th, whose commander he soon became, and with which he participated in Sheridan's victorious movements in the Shenandoah. For services at Cedar Creek he was brevetted brigadier-general, and was mustered out in 1866 with full rank of brigadier and brevet of major-general. Subsequently he was active in the affairs of the New York State National Guard.

Hamblin, Thomas Sowerby, American actor: b. Pentonville, near London, England, 14 May 1800; d. New York 8 Jan. 1853. He was early a member of the corps of the Sadler's Wells and Drury Lane theatres, was a tragedian at Bath, Brighton, and Dublin, came to the United States in 1825, appeared at the Park Theatre, New York, and acted in leading American cities. He was manager of several New York theatres, and among his rôles were those of Macbeth, Hamlet, Othello, Rolla, Pierre, Virginius, and Coriolanus. He was esteemed second only to Forrest and the elder Booth, and made the standard drama a feature of his management, under which the Bowery Theatre saw its historic days.

Hamburg, hăm'bėrg (Ger. häm'boorg), Germany, a free city and state of northwestern Germany, the city occupying 30 square miles of the state's total area of 157.18 square miles. The city is the greatest commercial port on the European continent, the chief of the three Hanse towns, and the seat of the upper Hanseatic court. It is situated at the junction of the Alster and the Bille, on the right bank of the northern branch of the Elbe, about 93 miles from the North Sea. With its connecting suburbs Altona and Ottensen it has a river frontage of over five miles. The river is spanned by two fine bridges, and there are numerous bridges across the canals which intersect the east and lower part of the city in all directions, and across the Alster which flows through the city and forms two ornamental pieces of water, the Aussen-Alster and the Binnen-Alster or Alster-Bassin. The latter is surrounded by fine quays, the Alter Jungfernstieg and the Neuer Jungfernstieg, lined with handsome residences, hotels, and stores, and constituting the chief thoroughfare in the city. The harbor accommodation is extensive; the principal quays along the Elbe where the ocean steamships lie are the Kaiser-Quai and the Sandthor-Quai. The boulevards or Anlagen occupy the site of the ancient encircling walls, removed since 1815. The modern portion of the city, rebuilt since the destructive fire of 1842 in a magnificent and expensive style, is in striking contrast to the older low-lying portion, with its back streets, bordered by warehouses, and the meaner class of dwelling houses. The most important public buildings are the Exchange, a noble edifice consisting chiefly of a magnificent hall surrounded by a fine colonnade and containing a large commercial library; the modern Rathaus in Renaissance style, and the Deutsches Schauspielhaus. Among ecclesiastical structures are the 19th century Gothic church of St. Nicholas with a tower and spire 473 feet high; the 18th century Renaissance church of Saint Michael's, with a spire 426 feet high, the 15th century church of St. Catherine's, the 14th century church of St. James, and a fine Jewish synagogue. Besides the numerous private and public schools the educational institutions include the Johanneum institution founded in 1528, containing a college, museums, and the city's extensive library; the Kunsthalle with a large art collection; and zoological and botanical gardens, etc. Among the many charitable and benevolent institutions are well endowed hospitals, orphan, and insane asylums, and there is also an organized system of municipal poor relief. The sewerage system has been modernized, and the general sanitary conditions improved, especially since the severe choleraic epidemic of 1892. The municipal waterworks, dating from 1531, have been added to at various dates and a modern filtering plant installed since 1893; municipal

bath and wash houses are maintained; food [illegible] after; the gas [illegible] plants are civic pr[illegible]; and a large revenue is obtained from the electric [illegible]h are operated by private [illegible].

The importance of Hamburg is due to its great marine commerce, which has been facili[illegible] the engineering enterprises of the in[illegible] the bed of the river, cut[illegible] and since 1890 in the construction at C[illegible]en, at the mouth of the river, of enor[illegible]. Seven railroad lines enter the city, which is connected also by rivers and canals [illegible] nearly all parts of the German empire. In 1900, 12,912 vessels with a net tonnage of 8,148,218 tons entered, and 14,030 with a [illegible] tonnage of 8,203,252 cleared the port. The exports by sea in 1901 amounted approximately [illegible] valued at $454,886,750; the im[illegible]y sea in the same year were approximately 9,701,346 tons, valued at $540,177,750. Raw ma[illegible] [illegible]pecially coffee, and manufac[illegible] articles are the chief imports, the last item [illegible]g also the bulk of the exports. The city's manufacturing interests, though large, are l[illegible] important, including ship-building, iron-founding, tobacco and cigar making, sugar re[illegible] distilleries, breweries, and numerous other d[illegible]tic industries. The banking, exchange, and marine assurance business of Hamburg has b[illegible] on an extensive scale since the establish[illegible] of the Hamburg giro-bank in 1619, and is one of the most important in the world.

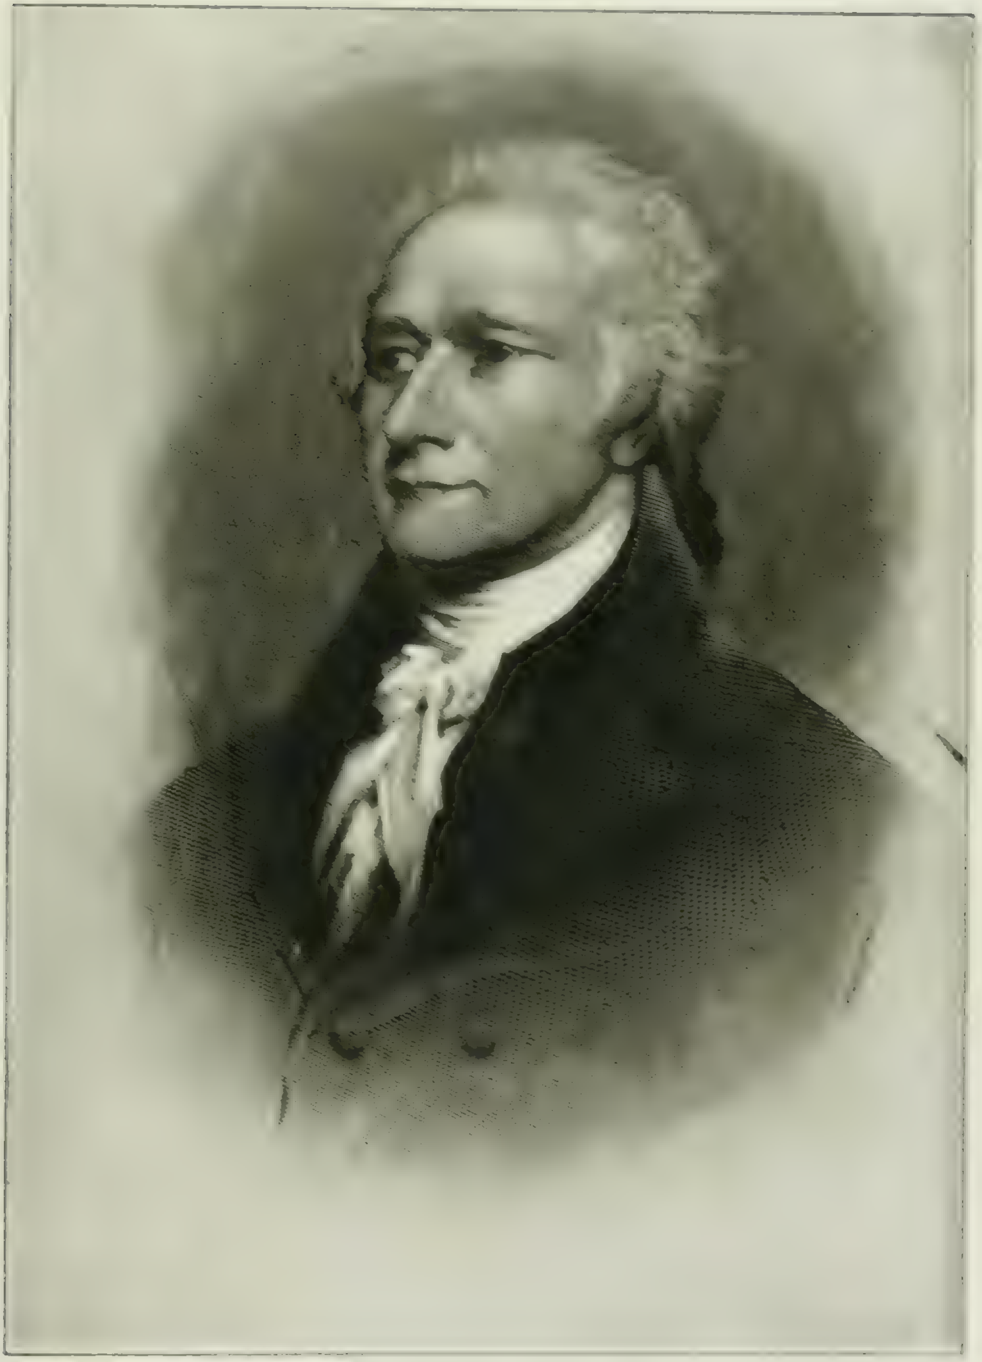
The city-state has a democratic constitution and is administered by an executive senate of 18 life-members, including a first and a second burgomaster elected biennially among the mem[illegible], and by the legislative House of Burgesses composed of 160 members elected every six [illegible] one half of whom retire every three years. The population of the city is second to that of Berlin in the German empire; in 1900 it was 70[illegible].

The city was founded by Charlemagne, who, between 808 and 811, built a citadel and a church on the heights between the Elbe and the east bank of the Alster as a bulwark against the neighboring pagan Slavs. In 831 it became an episcopal see. It was frequently devastated by Danes and Slavs, but in the 12th century had be[illegible] an important commercial city, and in 1241 and 1249 combined with Lübeck and Bremen in forming the Hanseatic League. It was de[illegible] an imperial city by Maximilian in 1510, but was not formally acknowledged until 1618. During the Thirty Years' War its population and p[illegible]rity increased owing to the immunity of [illegible]sition, and in the following century ex[illegible] commercial relations with North Amer[illegible] were developed. In 1810 it was incorporated in the French empire as the capital of the de[illegible] of the Mouths of the Elbe, but was occupied by the Russians in 1813. They were driven out by the French under Davoust, two months later, and the city underwent [illegible] financial spoliation at the hands of the conqueror and extensive depopulation. In 1815 it became an independent state of the German federation, forming with Lübeck, Bremen, and Frankfort, the [illegible] of the free cities. Its trade and im[illegible] have increased ever since. In 1871 it united with the German empire as a free [illegible]: but did not join the Zollverein or German Customs Union until 1888.

Hamburg Fowls. See POULTRY.

Hamilcar, hā-mĭl'kar, a name of common occurrence at Carthage, and borne by several of its most distinguished citizens, among whom the chief was HAMILCAR BARCA ("lig[illegible]": b. Carthage; d. Spain 228 B.C. He was the father of the celebrated Hannibal. While a young man he was appointed to the command of the Carthaginian forces in Sicily, in the 18th year of the first Punic war, 247 B.C. He estab[illegible]ed himself with his whole army on Mount Hercte (now Monte Pellegrino), where he not only succeeded in maintaining his ground, but sent out squadrons to plunder the coasts of Sicily and Italy. In 244 he quitted his strong position, and, landing at the foot of Mount Eryx, converted the town of that name into a fortified camp for his army. For two years he defied all the efforts of the Romans to dislodge him; but the Carthaginian admiral, Hanno, having been totally defeated off the Ægate Islands, 241 B.C., he reluctantly consented to withdraw from Sicily. His inability to perform the promi[illegible] which, to keep them in obedience, he had made to his mercenary troops, brought about their re[illegible]t after returning from Sicily, and as they were joined by almost all the native Africans, Carthage was brought to the brink of ruin. The incapacity of Hanno, who had been entrusted with the suppression of the revolt, led all par[illegible] to concur in the appointment of Hamilcar. He defeated the enemy with great slaughter, reduced their towns to subjection, and after [illegible]eral alternations of fortune, and the appoint[illegible] of Hanno to a share in the command, the war was brought to a successful close, 238 B.C. Hamilcar now projected the formation of a new empire in Spain, to be a source of strength to Carthage, and the point whence hostilities might be renewed against Rome. This policy was ably prosecuted after his death by Hasdrubal and Hannibal. Hamilcar penetrated into the heart of the country, reduced some cities and tribes, and acquired vast wealth. He pas[illegible] nine years in Spain, and fell in a battle against the Vettones.

Hamilton, Alexander, American statesman and soldier: b. Charles Town, in the island of Nevis, W. I., 11 Jan. 1757; d. New York 12 July 1804. His parentage is uncertain, but it is generally accepted that he was the son of James Hamilton, a Scotch merchant in Nevis, and Rachel Levine, the daughter of a French physician. Hamilton's father was unfortunate in his business ventures, and having become a bankrupt it was necessary for Alexander, at the age of 12 years, to earn his own living. He secured a position as clerk in the counting-house of Nicholas Cruger of Saint Croix. His "genius for affairs" was soon apparent, and after two years we find him entrusted with the full management of the business. But ambition for something more than a commercial career had already taken hold of the young man's mind, and he began to write for the local press. A very strong and vivid description of a West Indian hurricane, which had devastated the islands, attracted general attention and aroused the lad's friends to provide the necessary funds



to enable him to come to America to complete his education. He arrived at Boston in 1772, and was put in a school at Elizabethtown, N. J., where he industriously prepared himself for college, and in 1774 he entered King's College (now Columbia University), and made a brilliant record as a student. The friction between England and the American colonies was constantly growing more serious, and after studying the question and being convinced that the colonists were right, Hamilton began the advocacy of their cause in a speech at a public meeting, 6 July 1774. The meeting assembled to discuss the calling of a general congress and was held in the fields (now City Hall Park). He also published two pamphlets, asserting the colonists' position in relation to the Crown and to Parliament, and justifying their appeal to arms. The pamphlets were at first thought to be productions of well-known leaders, and when their authorship became known it gave Hamilton a national reputation. Hamilton now turned his attention to preparation for military service in the Revolution. He secured a commission as captain of the first Continental artillery company and entered the patriot service in March 1776. His natural aptitude for organization and command soon made the company a model of discipline and efficiency. He participated in the battles of Long Island, White Plains, Trenton and Princeton, and won the commendation of his superiors for his skill and courage. On 1 March 1777 Hamilton was appointed lieutenant-colonel and aide-de-camp on the staff of Washington, whose entire confidence he secured, becoming the general's confidential secretary. He took an active part in his chief's battles, assisted in planning campaigns and in devising means for the support of the army, and was entrusted with the important and delicate mission of going to Albany to obtain troops from Gen. Gates (who had previously been ordered to send troops to Washington and had failed to do so) — a duty which Hamilton performed with skill and success. It was while on this mission that he first met Elizabeth Schuyler, the daughter of Gen. Philip Schuyler of New York, whom he afterwards married (14 Dec. 1780). Having received a reprimand from Washington for a supposed delay he took offense and resigned from the staff 16 Feb. 1781. He had no intention, however, of resigning from the Continental Army, and becoming the head of an infantry regiment, he took part in the siege of Yorktown, heading a storming party and capturing one of the strongest British redoubts. The war was now practically ended, and there being no further opportunity for success in the army, Hamilton returned to civil life. He was yet but 24 years old, but by his natural abilities and capacity for leadership he had attained a foremost place among the great men of his day.

The activity of Hamilton's mind is seen in the fact that while still in active military service he found time to study the great questions of government and finance. In a letter to James Duane he clearly set forth his views on the Constitution, that: «Congress should have complete sovereignty in all that relates to war, peace, trade, finance, and to the management of foreign affairs.» A letter to Morris on the establishment of a national bank induced him to offer Hamilton the place of receiver-general of Continental taxes, which he accepted and originated a new system of national taxation. The receiver's office did not prove congenial, and he was relieved of its duties by his election to the Continental Congress from New York 1 Oct. 1782. Congress proved a disappointment. Such were the deplorable conditions then prevailing, the looseness of the Constitution and the financial chaos of the government, that Hamilton's efforts to carry through reforms utterly failed. He resigned from Congress in 1783 and returned to the practice of law in New York, where his melodious voice, dignified deportment and unanswerable logic of reasoning, soon placed him in the highest rank of his profession.

The condition of the States at this time is graphically depicted by Senator Lodge in his 'Life of Hamilton': «Divided among themselves, with no army, no navy, no cohesion, floundering wilfully and helplessly in a sea of unpaid debts and broken promises, bankrupt in money and reputation alike.» To secure some relief the Annapolis Convention (q.v.) was held 11 Sept. 1786, five States only being represented — New York, New Jersey, Pennsylvania, Delaware and Virginia. Hamilton was one of the delegates from New York. This convention adopted an address, drafted by Hamilton, reciting the intolerable conditions and calling for a convention to meet the following May in Philadelphia to form a Federal Constitution. (See CONSTITUTION, FRAMING OF THE.) Upon his return to New York he was elected to the State Legislature which convened in January 1787, and began a fight to induce the State to send delegates to the Philadelphia convention. In this he succeeded, and three delegates were appointed, of which Hamilton was one; but the other two were Anti-Federalists, bitterly opposed to Hamilton's idea of a strong general government. When the convention met the vote of his own State was cast against him on every question; the Anti-Federalists withdrew from the convention, leaving New York without a vote. Hamilton, however, presented his views of a plan of government to the convention — an aristocratic republic, with a president and senators chosen for life, and the State governors appointed by the Federal government. After the presentation of this plan, which found no support in the convention, Hamilton withdrew, only returning to engage in the final debates, and at the close he heartily embraced the work of the convention and signed the Constitution as actually adopted.

The Constitution was still to be ratified by the States. New York was opposed to its adoption. There were numerous internal strifes and jealousies, but with great power and determination, Hamilton combated and won over all opponents in the legislature, and by his essays in the 'Federalist,' assisted by Madison and Jay, he successfully fought the great battle for the Constitution, winning a hostile majority to its support. Of these essays George William Curtis declared they «gave birth to American constitutional law, which was thus placed above arbitrary construction and brought into the domain of legal truth.»

Washington was inaugurated President in April 1789. In September 1789 Congress passed an act establishing a Treasury Department, and Washington at once made Hamilton the first

Secretary of the Treasury. His creative, constructive and practical mind was now confronted with the problem of giving to his country a workable system of national administration. With a master's hand he organized the Treasury Department; reduced the confused finances to order; provided for a funded system and a sound system of national taxation; induced Congress to assume the State debts; authorized methods for the establishing of a national bank and a mint, the raising and collection of internal revenue, the management of the public lands, and the purchase of West Point by the government. In 1791 his Report on Industry and Commerce appeared, wherein he discussed with profound ability and clearness the economic problems of his time, and inaugurated, in a very moderate way, the protective tariff system. His methods to strengthen the national government were vigorously opposed by those antagonistic to centralization, chief among whom was Thomas Jefferson (q.v.), and the controversies that then divided parties have been continued by the rival political parties to the present. Engrossed as he was with the home affairs of the government, Hamilton was nevertheless a deep student of foreign relations and advocated a position of strict neutrality on the part of the American government with regard to the difficulties of nations. He ably sustained Washington in his proclamation of strict neutrality between France and England, both in the cabinet and in the public press, and when M. Genêt, the ambassador of the French republic, tried to involve this country in a war with England, Hamilton was vigorous in his condemnation. It was at this time that Jefferson, then Secretary of State, took sides with editor Freneau of the Philadelphia 'National Gazette,' in his criticism of the administration and especially of the treasury department. Hamilton replied and the controversy became typical of the two great political parties — the Federalists and the Republicans. Jefferson's position in the cabinet was most uncomfortable and he resigned 1 Jan. 1794. In 1794 the Whiskey Insurrection (q.v.) occurred in Pennsylvania in opposition to the excise laws passed by Congress. Hamilton advised a vigorous policy and when troops were sent by Washington against the insurgents, Hamilton accompanied them and the "rebellion" quickly faded away.

Desiring to give more attention to his private interests Hamilton resigned from the Cabinet 31 Jan. 1795. He declined the office of Chief Justice of the United States Supreme Court and returned to his law practice in New York city where he was at once acknowledged the leader of the bar. But he still continued to take an active interest in political affairs. In 1794 Chief Justice John Jay (q.v.) was nominated by Washington as envoy extraordinary to negotiate a commercial treaty with Great Britain. With Lord Granville a treaty was drawn up known as Jay's Treaty (q.v.), the terms of which were so hard and unjust that when the treaty was published there was a violent outburst of indignation. Hamilton, however, in a series of essays signed "Camillus," defended the treaty as the best obtainable and after a severe struggle in Congress it was ratified. Washington thoroughly appreciated the judgment and genius of Hamilton, often consulted him on important matters, and received much help from him in the preparation of his messages and speeches. The "Farewell Address would have been less perfect as a composition," says Renwick, "had it not passed through the hands of Hamilton."

Hamilton had supported John Adams (q.v.) for the Presidency, but Adams was jealous of the power and influence of Hamilton over members of the Cabinet, and made war upon him, expelling his friends from office and assailing him personally. Hamilton blamed Adams for the loss of the elections in New York State, and denounced him bitterly. Adams was renominated in 1800 for the Presidency, but he was beaten by Jefferson, and the Federalist party never won another election. Owing to a defective clause in the Constitution (see JEFFERSON-BURR IMBROGLIO) the election was thrown into the House of Representatives, Jefferson and Burr having received an equal number of votes Hamilton exerted his great influence with the Federalists and Jefferson was elected.

In 1804 the Federalists nominated Aaron Burr (q.v.) for Governor of the State of New York. The contest was a bitter one and again Hamilton was instrumental in Burr's defeat, and the latter challenged him to a duel on the ground of an alleged insult. Under the idea that the continuance of his personal influence and the peculiar condition in which the affairs of the country were at the time demanded his acceptance of the challenge, he consented to meet Burr, and the duel was fought at Weehawken, N. J., 11 July 1804. Hamilton was wounded and died the following day, universally mourned by his countrymen.

American history presents no more striking character than Alexander Hamilton. He was not popular, nor did he strive after popularity, but after 100 years his name still holds a noble eminence. He lived for the public good. Eloquent and refined, able and brilliant, the embodiment of devotion, integrity and courage, he has left as deep a mark upon our political institutions as any other statesman our country has produced. Hamilton's works were published by H. C. Lodge in nine volumes (1885–6). Consult: Hamilton, 'History of the Republic of the United States as Traced in the Writings of Alexander Hamilton and His Contemporaries' (4th ed. 1879); Morse, 'Life of Alexander Hamilton' (2 vols. 1876); Lodge, 'Alexander Hamilton' (1882). For his writings, etc., consult 'Bibliothica Hamiltonia' (1886).

GEORGE EDWIN RINES,
Editorial Staff 'Encyclopedia Americana.'

Hamilton, Andrew, American lawyer: b. Scotland about 1676; d. Philadelphia 4 Aug. 1741. His early career is unknown. He was for a time called Trent, and it is not certain at what period he took the name of Hamilton. About 1697 he appeared in Accomac County, Virginia, where he opened a classical school. In 1716 he went to Philadelphia, the next year became attorney-general of Pennsylvania. From 1721 to 1724 he was in the provincial council, and in 1727 was elected from Bucks County to the provincial assembly, continuing to hold his seat, with a year's exception, until 1739, and in 1729 was speaker. He is best known for his gratuitous defense of John Peter Zenger, a New York printer, who was charged with libel in

publishing in a newspaper owned by him statements regarding the interference by the governor with the process of the law-courts. Hamilton's defense was based on the truth of the statements in the alleged libel. He was successful, was granted the freedom of New York, and, having thereby secured a freer discussion of public officers, was termed by Morris the "day-star of the Revolution." He became judge of the vice-admiralty court of Pennsylvania in 1737.

Hamilton, Anthony, COUNT, English courtier, and man of letters: b. probably Roscrea, Tipperary, Ireland, 1646; d. St. Germain-en-Laye, France, 6 Aug. 1720. He was descended from a younger branch of the family of the dukes of Hamilton in Scotland. His parents were Catholics and Royalists, and removed to France after the death of Charles I., and young Hamilton became domiciliated there. He, however, made frequent visits to England in the reign of Charles II. His sister was married to Count Grammont (q.v.). On the ruin of the royal cause he accompanied James to France, where he passed the rest of his life. Hamilton is chiefly known as an author by his 'Memoirs of Count Grammont,' a lively and spirited production, exhibiting a free and, in the general outline, a faithful delineation of the voluptuous court of Charles II. It is an admirable chronicle of the frivolous life of the French and English courts of that time. His other works are 'Poems' and 'Fairy Tales,' which, as well as the 'Memoirs,' are in French, and are really masterpieces of grace and sprightliness.

Hamilton, Edward John, American educator: b. Belfast, Ireland, 29 Nov. 1834. He was graduated at Hanover College, Indiana, in 1853, and at Princeton Theological Seminary in 1858; was professor of mental philosophy at Hanover College in 1868–79, and of philosophy at Hamilton College, Clinton, N. Y., in 1883–91. In 1895 he became professor of philosophy in the State University of Washington. He is the author of what is known as 'Perceptionism' (a system of metaphysical philosophy), and has published 'A New Analysis of Fundamental Morals' (1870); 'The Human Mind' (1883); 'The Modalist' (1883); 'The Perceptionalist or Mental Science' (1899).

Hamilton, Frank Hastings, American surgeon: b. Wilmington, Vt., 10 Sept. 1813; d. New York 11 Aug. 1886. He was graduated from the medical department of the University of Pennsylvania in 1833; in 1861 went to the war as surgeon of the 31st New York volunteers, was made brigade surgeon after the battle of Bull Run, and surgeon of Gen. Keyes' corps in 1862. A year later he became medical inspector of the United States army. He was one of the founders of Bellevue Hospital Medical College in 1861, and was professor of surgery there till he resigned in 1875. Dr. Hamilton was associated with Drs. Agnew and Bliss in the care of President Garfield. He wrote on the principles and practice of surgery three works, regarded as standard on the subjects treated: 'Treatise on Fractures and Dislocations' (1860); 'Practical Treatise on Military Surgery' (1861); and 'The Principles and Practice of Surgery' (1872).

Hamilton, Gail. See DODGE, MARY ABIGAIL.

Hamilton, Gavin, Scottish painter: b. Lanark, Scotland, 1730; d. Rome, Italy, 1797. Sent when very young to Rome, he there devoted himself during the remainder of his life to historic painting. One of his greatest works was his 'Homer,' consisting of a series of pictures representing scenes taken from the 'Iliad.' He published in 1773 'Schola Picturæ Italiæ,' composed of a number of fine engravings by Cunego, making part of the collection of Piranesi; he there traces the different styles from Leonardo da Vinci to the Carraccis; all the drawings were made by Hamilton, and this admirable collection now forms one of the principal treasures in the first libraries in Europe. He spent the latter part of his life in conducting archæological excavations in various localities near Rome.

Hamilton, LORD George Francis, English politician: b. Brighton 1845. He was a Conservative member of Parliament for Middlesex in 1868–85, for Ealing division in 1885–1902, in 1874–8 was under-secretary of state for India, and in 1878–80 vice-president of council. In 1885–6, and again in 1886–92 he was first lord of the admiralty, and from 1895 until his resignation in 1903 was secretary of state for India. His naval reconstruction plan of 1889 was the most extensive of the kind ever adopted by Great Britain. As secretary for India he displayed great ability in dealing with the numerous difficulties which arose during his administration.

Hamilton, James, American statesman: b. Charleston, S. C., 8 May 1786; d. at sea 15 Nov. 1857. He was educated for the bar, but entered the army and served with credit as a major in the Canadian campaign of 1812. At the end of the war he resumed the practice of law in Charleston. For several successive years Hamilton was chosen mayor, or, as it was then termed, intendant of Charleston. To his vigilance and activity was chiefly due the detection of a formidable conspiracy in 1822 among the negro population, led by Denmark Vesey, a free mulatto from Haiti. In the same year he was elected to the State legislature, and was also chosen a representative in Congress, of which he soon became a prominent and popular member. He became noted for intense and energetic opposition to the protective system and favored direct taxation, regarding all indirect processes for raising revenue as frauds upon the people, and as disparaging to the popular intellect, as well as popular morals. He quitted Congress to become governor of South Carolina in 1830, at a period when the State had resolved upon nullifying the tariff laws of the federal government. On the settlement of this question by Clay's compromise, Hamilton retired from public life for a time. Later he became interested in the cause of Texas, to which he devoted his personal services, and a large portion of his private fortune. In 1841, while Texas was an independent republic, he was her minister to England and France, where he procured the recognition of her independence. On the death of Calhoun in 1852, he was appointed his successor in the United States Senate, but declined the office.

Hamilton, John Church, American biographer and historian, son of Alexander Hamilton (q.v.): b. Philadelphia 1792; d. 1882.

Besides editing his father's works (1851), he wrote: 'Memoirs and Life of Alexander Hamilton' (1834-40); 'History of the Republic' (4th ed. 1879); 'The Prairie Province' (1876), sketches of travel.

Hamilton, John Taylor, American Moravian clergyman: b. Antigua, W. I., 30 April 1859. He was graduated from the Moravian College, Bethlehem, Pa., in 1875, and from the Moravian Theological Seminary there in 1877. He was pastor of the Second Moravian Church in Philadelphia, 1881-6, and has been a resident professor at the Moravian College and Seminary from the latter date. He has published 'History of the Moravian Church in the United States' (1895); 'History of the Moravian Church during the 18th and 19th Centuries' (1900); 'History of Moravian Missions' (1900).

Hamilton, John William, American Methodist bishop: b. Weston, Va., 18 March 1845. He was graduated from Mount Union College (Ohio) in 1865, and from Boston University in 1871, was ordained an elder of the Methodist Church in 1870. He was subsequently pastor of various congregations, including that of the People's Church, Boston, founded by him. In 1900 he was appointed bishop. He was corresponding secretary of the Freedmen's Aid and Southern Education Society (1892-1900), and has published 'Memorial of James Lee' (1875); 'Lives of the Methodist Bishops' (1883); 'People's Church Pulpit' (1884); and other works.

Hamilton, Kate Waterman, American novelist: b. Schenectady, N. Y., 12 Nov. 1841. Since 1870 she has lived in Bloomington, Ill. She is the author of 'We Three'; 'Vagabond and Victor' (1879); 'Rachel's Share of the Road' (1882); 'Tangles and Corners' (1882); 'The King's Seal' (1887); 'The Parson's Proxy' (1896); 'The Kinkaid Venture' (1900); 'How Donald Kept Faith' (1900); etc.

Hamilton, Patrick, Scottish reformer and martyr: b. probably Glasgow about 1504; d. St. Andrews 29 Feb. 1528. Adopting during a short residence on the Continent, the principles of the Reformation, when he settled at St. Andrews in 1523 he naturally cherished his new convictions, and in 1526 announced them with a decision that attracted the notice of Archbishop Beaton, who proceeded to have him formally summoned, and put on his trial. Hamilton had meanwhile fled to Germany, where an intimacy formed with Luther and Melanchthon deepened his convictions, and after an absence of six months he returned to Scotland. He openly preached in the neighborhood of Linlithgow, and Beaton, under pretense of a friendly conference, contrived to allure him to St. Andrews in January, 1528. The early stages of the conference were marked by a conciliatory spirit, but he was led into damaging avowals of opinion, and the result of his trial, on the last day of February, was that he was convicted of divers heresies, and delivered over for punishment to the secular power, by which he was condemned the same day. In the afternoon he was hurried to the stake in front of the gate of St. Salvador's College, his martyrdom, in the 24th year of his age, having done more to extend the principles of the Reformation in Scotland than his life could have done.

Hamilton, Schuyler, American soldier: b. New York 25 July 1822; d. there 18 March 1903. He was a son of J. C. Hamilton (q.v.) and a grandson of Alexander Hamilton (q.v.). He was graduated from West Point in 1841 and served in the Mexican War and in the Civil War also, becoming a major-general of volunteers in 1862. He was subsequently hydrographic engineer to the department of docks. In 1854 he published 'A History of the American Flag' and in 1877 'Our National Flag, the Stars and Stripes, its History in a Century,' delivered as an address before the New York Historical Society in June of that year.

Hamilton, Sir **William,** Scottish metaphysician; b. Glasgow 8 March 1788; d. Edinburgh 6 May 1856. Having studied with distinction at Glasgow, in 1807 he entered Balliol College, Oxford, where he gained first-class honors, and in 1813 he was admitted to the Scottish bar. His taste lay in a different direction, and while he diligently applied himself to almost every branch of literature, mental philosophy became his favorite study. In 1820 he became a candidate for the chair of moral philosophy in Edinburgh, rendered vacant by the death of Thomas Brown, but was defeated by Professor John Wilson. He was appointed professor of universal history in the University of Edinburgh in 1821, and in 1826 became a contributor to the 'Edinburgh Review,' and enriched it with a series of articles afterward published in collected form, with large additions, as 'Discussions on Philosophy and Literature, Education, and University Reform.' Of these the most celebrated was his 'Critique of Cousin's Cours de Philosophie,' in which was developed that philosopher's doctrine of the unconditioned. Many of these contributions were translated into the leading European languages, and attracted much attention from continental speculators in philosophy. In 1836 he became a candidate for an Edinburgh professorship, and succeeded in gaining the chair — which of all men living he was perhaps the best fitted to adorn — of logic and metaphysics. His zeal and ability in discharging its duties were rewarded by the number of ardent students whom he gathered around him. The fame of the Scottish school of metaphysicians, which had begun to wane, was gradually re-established; and his influence would have been felt to even a higher degree had he not been struck with paralysis in 1844, from which he never recovered so far as to undertake the full duties of his position. His mind, however, retained its vigor, and he endeavored to carry out literary designs he had previously formed. In 1846 he published an annotated edition of the works of Thomas Reid, and in 1854 the commencement of a similar edition of the works of Dugald Stewart. His lectures were published in 1859-61, under the editorship of Mansel and Veitch. His views are chiefly expounded in the 'Discussions' and in the 'Dissertations' appended to his edition of Reid, and are attacked in Mill's 'Examination.' See Veitch, 'Memoir of Hamilton' (1869); 'Hamilton: the Man and his Philosophy' (1883); Seth, 'Scottish Philosophy' (1890).

Hamilton, Sir **William Rowan,** Irish mathematician: b. Dublin 3 Aug. 1805; d. there 2 Sept. 1865. He knew Greek and Latin when only 6, and before he had completed his 14th

1. The Gore, King Street 2. View of Hamilton from Mountain

year had made himself acquainted with 13 languages, among which were Arabic, Persian, Hindustani, Sanskrit, and Syriac. When 10 years old he began the study of mathematics, and at 17 presented a paper to Brinkley, the Irish astronomer-royal, which exhibited such a profound knowledge of mathematics, that the latter declared the author of it to be already the first mathematician of his age. In 1827, the chair of astronomy in Trinity College, as well as the post of astronomer-royal, becoming vacant, Hamilton obtained both appointments, though then only in his 23d year. His life henceforth was exclusively devoted to abstruse studies. He was knighted in 1835; in 1837 was elected president of the Royal Irish Academy, and was an honorary or corresponding member of the principal scientific academies of Europe and America. In 1828 his 'Theory of Systems of Rays' was published. In this his celebrated prediction, on theoretical grounds, of the existence of conical refraction of a ray of light was given to the world. Reasoning on the properties of light, he came to the conclusion that under certain circumstances a ray, instead of being refracted in the ordinary way, should split up into a cone of rays; a phenomenon afterward proved experimentally by Lloyd to take place under proper conditions. In 1834 his 'General Method in Dynamics' was published. In this work and that on 'Systems of Rays' the whole of any dynamical problem is made to depend on a single function and its differential coefficients. Another important treatise of his is 'Algebra looked on as the Science of Pure Time.' He published also 'Memoirs on Discontinuous Functions, or Equations of the Fifth Degree, etc.' But the foundation on which his fame most securely rests is the discovery or invention of the calculus of quaternions, an instrument of extraordinary power in the solution of intricate problems in mathematics and physics. His 'Lectures on Quaternions' appeared in 1853, and in 1866 a posthumous work on the same subject entitled 'Elements of Quaternions.' See Life of Sir William Rowan Hamilton,' by Graves (1883–9), with an Addendum (1892).

Hamilton, Bermuda, a seaport town, the capital of the Islands on Great Bermuda, Long, or Hamilton Island. It has a fine landlocked harbor. Founded in 1790. Pop. (1901) 2,246.

Hamilton, N. Y., a village of Madison County, 29 miles southwest of Utica, on the New York, O. & W. R.R. It is the seat of Colgate University (q.v.). It is in a good agricultural region, contains a lumber yard and canning factory, and has a stone quarry, from which the stone for the construction of most of the University has been taken. Hamilton was first settled in 1792, was separated from the township of Paris in 1795, and named in honor of Alexander Hamilton; the village was incorporated 12 April 1816; in 1895 a fire destroyed the business portion of the town, in which the village records were lost. Later in the same year, waterworks and an electric lighting plant were established, which are owned and operated by the town. In 1903 a free library was opened by the Library Association, and it is intended to make it a public library supported by the village corporation. (Pop. 1900) 1,627.

Hamilton, Ohio, city, county-seat of Butler County; on the Great Miami River, the Miami & Erie Canal, the Pittsburg, C., C. & St. L., and the Cincinnati, H. & D. R.R.'s; about 15 miles north of Cincinnati, and 32 miles southwest of Dayton. Gen. Arthur Saint Clair established here a fort, in 1791, and called it Fort Hamilton, in honor of Alexander Hamilton. It was incorporated as a town in 1810. The excellent water-power has been of great advantage in the developement of the city, as manufacturing is its chief industry, although it is located in an agricultural section. The canal has also contributed to the water-power available for manufacturing purposes. Its chief manufactures are paper, flour, beer, woolen goods, agricultural implements, machinery, tools, and iron. The trade is in the manufactured articles and in tobacco, hay, grain, and vegetables. The government is vested in a mayor, who holds office three years, and a board of control composed of five members, each one of whom is the head of a department of the city's government. They are elected for five years. The city owns and operates the electric light plant, the waterworks, and the gas plant. Pop. (1900) 23,914.

Hamilton, Ont., Canada, city and capital of Wentworth County, situated on the shores of Burlington Bay at the western extremity of Lake Ontario, 40 miles from Toronto, 42 miles from Niagara Falls, and 70 miles northwest of Buffalo. It was laid out and settled in 1813 by G. Hamilton, and is built on a plateau of slightly elevated ground extending around the front of a hilly range from Niagara Falls. Hamilton is connected with a large system of Canadian and American Railways,— the Canadian Pacific, Grand Trunk, Toronto, Hamilton & Buffalo, the Michigan Central, the New York Central, and the Lehigh Valley and Wabash Railways. Hamilton's geographical position at the head of Lake Ontario affords the best shipping facilities to the Northwest Provinces and European markets by water, while her railway facilities are not excelled by any city in the Dominion. She has also become a centre of a complete electric railway system. There are 19 miles of street railway, 110 miles of streets, 60 miles of sewers, and 465 street electric lights. Hamilton is the chief manufacturing city in Canada and is in the centre of a fine fruit-growing district. It manufactures very largely, some of the chief industries being agricultural implements, air brakes, and electrical supplies, belting, boots and shoes, carriages, cigars, tobacco, clothing, drugs, elevators, emery wheels, engine packing, fertilizers, files, fireworks, furnaces, gasoline engines, harness, glue, mats, paints, pottery, soaps, spices, silverware, nails, wine, vinegar, mattresses, wringers, washing machines, and musical instruments. It has 2 cathedrals, 62 Protestant churches, 7 Roman Catholic churches, 15 banks, 18 public schools, 7 separate schools, 2 art schools, 2 convents, a public library, 26 charitable institutions, 4 hospitals, 2 incline railways, 4 theatres, a large insane asylum, 7 parks, a wireless telegraph station, 200 groceries, 5 bands, 2 sewage disposal works, 3 reservoirs, capacity (main) 11,000,000 gallons; 50 social and athletic clubs, about 200 national and secret societies, 100 hotels and 3 daily papers. Pop. (1904) 60,000.

J. Castell Hopkins,
Editor 'The Canadian Annual Review of Public Affairs.'

Hamilton College, an institution located at Clinton, Oneida County, N. Y.; founded by Samuel Kirkland, a Congregationalist missionary, in 1793, as an academy for both white and Indian children. The school was not opened until 1797, although Gen. Frederick William Steuben laid the cornerstone in 1794. Lack of funds prevented the completion sooner, and to the untiring efforts of its founder was due, in a great measure, the success of the undertaking. It was first called Hamilton Oneida Academy, so named in honor of one of its trustees, who was also a benefactor. In 1812 it was chartered by the University of the State of New York as Hamilton College. The school has grown steadily in facilities, keeping well abreast of the times. Two courses are offered: the Latin-Scientific and the Classical. It has fine scientific collections, an astronomical observatory, and well-equipped laboratories. The college has at its disposal 1 fellowship, 55 scholarships, 4 prize scholarships (yielding $200 each), and a number of valuable prizes. The campus, nearly 100 acres, has many notable improvements, gifts from graduates. In 1904–5 there were connected with the school 18 professors and instructors, and 198 students. The library contained about 45,000 volumes.

OREN ROOT,
Registrar.

Hamilton Inlet, Labrador, the estuary of the Hamilton or Grand River (q.v.). It is 150 miles long and has a maximum width of 30 miles. On its north shore is Rigolet, a Hudson's Bay Company trading-post.

Hamilton, Mount. See LICK OBSERVATORY.

Hamilton Series, a series of rocks, including the Hamilton and Marcellus stages and constituting the middle Devonian. The name is from the town of Hamilton, 29 miles south of Utica, N. Y., where the series is typically developed. It consists there of shales and sandstones with a few beds of limestones, the most prominent being the topmost member of the series. The Hamilton, like the other Devonian formations, was laid down along the Atlantic shores of what was then the American continent and in a great interior sea, sedimentation being heaviest in the northeast gulf of this sea. The sea extended from eastern New York to western Iowa. In the west the series is largely calcareous. The series is about 1,500 feet thick in eastern New York and reaches a maximum of 2,000 to 5,000 in Monroe County, Pa. It rapidly thins westward, and the south end of Lake Huron is only 20 to 50 feet thick. At the falls of the Ohio, above Louisville, the series is represented by 20 feet of hydraulic limestone. The rocks forming the high cliffs along the Delaware River south of Port Jervis, Pa., are of Hamilton Age. Outside of the interior basin rocks of Hamilton Age have been determined in the Gaspe region of Canada, where they reach a thickness of 7,040 feet. In the Eureka district, Nevada, is a great but undetermined thickness of Hamilton limestone, and in the Mackenzie River valley in Northwest Territory is a deposit of fully 500 feet of fossiliferous limestone, partly at least of Hamilton Age. From the fossils found it is evident that the plants in the Middle Devonian forests were mostly Acrogens and included giant club mosses or Lycopods, tree ferns and Equisetæ. One tree fern, *Psaronius*, had a trunk four feet thick. The gymnosperms were ancestors of the family of the conifers, being related to the yews. Insects, some of considerable size, abounded. In the ocean brachiopods were the most numerous and characteristic animals. Lamellibranchs were more abundant than in Cambrian time and there were true barnacles. The shallow muddy waters of the eastern part of the interior sea were not favorable to the growth of crinoids and corals, but these were common westward. Of the gasteropods *Platyceras* and *Pleurotomaria* were common genera. See DEVONIAN PERIOD; DEVONIAN SYSTEM and EQUISETÆ.
